# GARDENERS' CHRONICLE

OF ANABARIOA

### **BURNETT BROTHERS**

#### BURNETT'S SPECIAL LAWN GRASS MIXTURE

The above mixture is made from our own formula, and composed of grasses specially adapted for the purpose of producing turf which retains its rich green color and velvety appearance throughout the entire Summer and Fall. In making up this high grade mixture we are careful to use only the very finest quality of all the most desirable dwarf evergreen, recleaned grasses, free from chaff and weeds, which thrive well on any soil, thus ensuring a beautiful and permanent lawn.

Price: pk., \$1.75; bushel (20 lbs.), \$6.00.

WE MAKE A SPECIALTY OF GRASS SEED MIXTURES FOR ALL SITUATIONS

#### A Range of Greenhouses on Top of a New York Store 200 Feet Above the Street

F AR above the hurly burly of noisy, bustling New York, Mr. C. C. Treple has a range of greenhouses on top of Bloomingdale Bros,' store at Fifty-ninth Street.

Eighteen years ago we built the first houses and have continued adding to them. Two, we just completed, 26 feet and 52 feet long.

We consider this a pretty good recommendation for our construction—eighteen years of hard usage. There is probably not another greenhouse in the country that has had the number of people visit it. Today, outside of minor repairs, the original houses are as good as the day they were built.

houses are as good as the day they were built.

Here the flowers are grown that are sold in the flower shop on the ground floor. This flower garden on the roof gives people a chance to see how flowers and plants are grown. It also gives a prospective purchaser of a greenhouse a chance to see a greenhouse built in its entirety. It shows you the superstructure, plant benches, and heating apparatus.

We tell you all this just to show you the variety of greenhouse building problems we are continually solving successfully.

Besides running this shop and range of houses, Mr. Treple also runs the flower store at Gimbel Bros., 33rd St. and 6th Ave., New York, and has recently opened a new one at 89th St. and

We hope that when you are ready to build, you will think of us as the builders. When you are ready to talk it over,—say when and where and we'll be there.

#### THE ONE BEST PINK CANNA

Mrs. Alfred F. Conard

T'S a wondrous salmon pink that fades into beautiful pink tones. It blooms early and keeps at it. When and keeps at it. When spent, the blooms free themselves from the stalk. Its height is average. We originated this Canna. It has all the stamina and backbone in it that are characteristic of the Cannas Mr. Wintzer develops. We have an exceptionally fine lot of fat clumps, such as will look good to the most critical customers. You can depend on our not sending you any culls.

If you want Conard,

Blanche Wintzer, or whatever kinds; if we should be sold out on our fine Swastika standard stock we won't send anything. That's the way we do business. We ship our Cannas

in any quantities, direct from our storage shelves and not in already packed, boxed lots.

### A Useful Collection of Spray Orchids

By Wm. Turner

Is there any flowering plant more graceful or effective than a collection of spray orchids? Indeed, it is the spray orchid that gives the finished appearance to any orchid group, particularly when the short stemmed kinds are used liberally as companions to the tall, stately sprays. When we realize the rich effect that can be produced with a collection of those gems, it is no small wonder they have jumped to the foremost rank in recent years both as a choice cut flower, and for decorative effects. None can deny as to their keeping qualities, for they have no equal and as for their colors, combinations and gracefulness, they are peerless. True, many of the varieties are apt to wear out sooner than the cattlevas. and no wonder, when we stop to consider the strain many of those plants must be under in producing those terrific spikes. I dare say there are many that have looked upon those little plants with wonderment, seeing them produce spikes three and four feet in length. Still. with good treatment and a good season of rest, they may be kept in a healthy, vigorous condition for several vears. I presume one of the best known species is Oncidium Varicosum, and its variety Rogersii. In fact, it is Rogersii that has given this Oncidium priority over many of the others as the individual flowers are much larger and of more substance. In their season of growth they will thrive admirably in the cool end of the Cattleva house and if hung somewhere near the glass. They seem to appreciate such treatment. Nor will they thrive if placed in too large receptacles. Dendrobium Phalaenopsis Schroderiana makes an admirable companion to Varicosum, coming in as they do around the same time, although I do not think it wise to handle this variety unless more heat can be given than just merely Cattleya house temperature. While one may see them growing in such a temperature they must be grown in a warmer, closer atmosphere to produce strong, vigorous growths. Unquestionably D. Phalaenopsis when well grown is one of our very best and most useful orchids, either for cut sprays or plant decoration; and what a combination of colors there are; one may look over a batch and hardly find two alike. This orchid, like many others, keep in as small a receptacle as possible, which is the key-note to success to a certain extent. Neither do they care to have their roots tampered with more than is absolutely necessary. But whoever has a house adapted for growing this species which should be at least 5 or more degrees over a Cattleva house temperature will have one of the most useful spray orchids that I am acquainted with.

Another Mexican fall or early winter flowering variety is worthy of note for its free flowering qualities and

massive spikes. Although better results may be had by growing this species in a trifle lower temperature and particularly so during their resting period, (). Tigrinum, which is well known among all lovers of the orchid family and may be relied on to make an imposing display during their season of flowering, I dare say I am not over-stepping the mark when I say Onc. splendidum stands out pre-eminently as one of the very best for midwinter display, their stately spikes and massive, bold flowers are apt to cause admiration during the winter months. This Guatemalean variety will respond readily to more heat than many of the Oncidium family, at the same time with care and good judgment can be grown very successfully in a Cattleya house temperature providing they do not receive too much water at their roots. By the way, is their another orchid that will resent over-

ONCLULATIVE TRUE RELATED

watering more so than splendidum? Why, it is not an uncommon occurrence for a batch of this King of Oncidium to go at times for weeks without any water applied to the roots, in fact they seem to revel with such treatment providing the atmospheric moisture is agreeable to them. Therefore it is not necessary to hear the complaint which at times is the case in regard to the young growths rotting off. Even though grown with the Cattleyas, when such does occur, a safe remedy to eradicate the trouble is considerably less water at the roots. It is surprising the amount of flower spikes a healthy batch of this variety will produce.

Like all other valuable plants, usually they have their enemies in the way of insect pests, slugs are extremely partial to the young succulent spikes just as they are forming at the base of the new bulb, therefore it is well to keep a sharp lookout for these enemies for some time, before they commence to produce their flower spikes, otherwise serious damage will be done. With a poor crop of flowers, no matter how little damage seemingly has been done, we find when a slug has once started into the young spike it, at its best, will be a cripple and of little or no value. I dare say, every orchid grower has his favorite methods in trapping them, with lettuce leaves laid on the pots, carrots cut in halves, or potatoes laid on the pots, cutting a hollow into them and turning the hollow towards the peat. They often may be caught. It seems almost increditable at times that those tiny slugs, not much larger than the head of a pin, are destructive beyond comprehension, and are the cause of worry and annoyance, and particularly so with O. splendidum, or, for that matter, the whole of the Oncidium family, may be included.

What an interesting species that old O. papilio is, as the name implies, butterfly, which is truly a good imitation of nature. However, this variety may be classed more as a curiosity than anything else. Still, I venture to say, Papilio has aroused the curiosity of many flower lovers. To grow this species successfully a warm house is necessary. I have often wondered why we do not see more of that noble variety, O. Marshallianum. True, it's a bit straggly in growth, also a spring flower, but wherever a batch is to be seen, it is apt to cause admiration. Still,

there is such a variation with the different varieties of Oncidiums being collected in different sections and different altitudes, we find some species thrive best with more heat, others with less. Marshallianum, for instance, will resent too much in quick order, and can be handled better with a few degrees less than are applied to Cattleyas.

Vanda Caerulea, when any one comes down to a delicate blue orchid such as Caerulea, they are mighty scarce. For autumn cut flowers or for decoration, the graceful sprays of Caerulea will have a telling effect wherever placed; in fact, one may say, this variety stands alone for its delicate blue shadings. While they all are blue, it is wonderful the different delicate shades that may be found among a batch, not uncommon to hardly find two plants just alike. Caerulea will also thrive better in a cooler temperature than most of the Vandas.

There are so many spray orchids that come to mind that are worthy of mention, yes, far more than can be mentioned in a short article. But, perhaps, the man that can grow the Phalaenopsis family to perfection has got one of the choicest spray orchids there is to be had, but why is it, as a rule, when anything is extremely beautiful there is usually something tricky about them? I am satisfied, that to grow Phalaenopsis successfully, depends largely on the house as well as the general care and good treatment they receive from the grower. Certain it is, there can be no success in a house unless abundance of moisture can be maintained. We have noticed at times in years gone by, even before the up-to-date houses were thought of, Phalaenopsis could be found flourishing with leaves and flower spikes of great substance, and we have also known to change them from that particular house to another would mean partial ruin. Be it as it may, it has been an undisputed fact, these species may flourish in a certain house and lose their vigor in another, even though the same man was in charge.

Such varieties as P. Amabilis, Schilleriana and Rimestadiana are, I dare say, three of the best for general purposes and for their large, massive sprays. With the host of material in the way of spray orchids and their value for decorative effect I have often wondered why they were not more largely grown.

### How to Produce Perfect Lawns

Oft times it is a difficult matter to secure a good stand of grass over the lawn or it may be almost impossible to maintain the velvety bluegrass, June grass or Bermuda during a period of severe drought. In fact, the problems of the efficient lawn which will prosper for five months in the year are worthy of considerable study on the part of the suburbanite who perhaps off-handedly will maintain that soil, seed and water are the only requisites of an attractive and thrifty grass plot, writes George H. Dacy in *The Field*. As a matter of fact, there is just as much science involved in the culture of a seemly greensward as there is in the production of our most valuable economic crops and plants.

The lawn must be favored with plenty of available plant food for the proper nourishment of the grass; it must have access to plenty of sunlight; it must be supplied with sufficient moisture; it must be maintained free of weeds; the grass clippings must be left on the lawn to decay and enrich the soil, and the correct

amount and suitable variety of grass seed must be sown whenever it is essential to re-seed the lawn. The fertilizer de luxe for the grass plot is barnyard manure, which should be applied as a top dressing in the fall, about fifteen tons to the acre. Stable refuse that is free of weed seeds should be used. Plenty of litter is necessary in the manure, as it forms a protective mulch for the lawn, particularly in the northern latitudes where the winters are severe. This covering of straw in no respect impedes the fertilizing ingredients from being leached into the soil. The straw may be raked off in the spring when the lawn is in the pink of condition for a productive season. The fertile soil which is intensively fertilized with plenty of stable refuse should produce an elegant sward where care is exercised to control weeds.

One of the most desirable seeding mixtures that can be used consists of a combination of twenty-five to thirty pounds of bluegrass seed and six to eight pounds of white clover seed to the acre. In some of the public parks excellent results have obtained where a mixture of two bushels of Kentucky bluegrass, two bushels of red top, and six pounds of white clover seed per acre has been used. Where a vigorous growth is desired, one to one and one-half pounds of this mixture per 100 square yards of lawn surface is sufficient. Only seed of the best quality should be used, as money spent for inferior grass seed is worse than wasted. At the offset it is wise to purchase the best grass seed that is obtainable.

The lawn should be uniform in color, even in texture, and should form a fine, elastic turf. A deep emerald green is the color that is most popular for greensward. The novitiate to the game of lawn-making must constantly bear in mind that a perfect lawn represents years of patient effort. A velvety, turfy greensward is never secured overnight. It means work and lots of it to develop the handsome grass plot.

If the lawn is located on a hard soil that is deficient in nitrogen and humus it is beneficial to sow four or five quarts of crimson clover seed per acre over the plot as crimson clover is an efficient leguminous soilrenovator. To properly grade the lawn and to secure efficient drainage are the alpha and omega of successful grass culture. In case the lot has recently been filled in it should be given plenty of time to settle before the seed is sown. In the interim all the weeds should be thoroughly hoed out. Where the land is native sod it should be top-dressed during the fall of the year with about fifteen loads of well-rotted manure to the acre and subsequently if a spring seeding is desired the soil should be deeply plowed. The following spring a lighter application of manure should be made while the lawn should be efficiently cultivated and disked in order to control the obnoxious weeds. The type of the sub-soil is of measurable importance in lawn-making, as summer drought is always a limiting factor in the case of light and gravelly sub-soils, while ordinarily a healthy vigorous sod develops over a clay

Soil to be used in lawn-making operations should never be taken from excavations of considerable depth, as earth of this character is not suitable for grass production. If it is necessary to use excavated dirt in the lawn approximately fifteen tons per acre of thoroughly rotted manure should be incorporated with this soil, or in case fertilizer of this variety is not available then liberal amounts of bone meal and lime should be applied previous to seeding time. The seed should be sown as early as possible in the spring so that the young grass plants will be well enough established to withstand the summer's dry spell and will attain a vigorous growth before the annual weeds begin to battle with them for the soil's offerings of plant food and moisture. A fall seeding is desirable if a prolific, well-rooted stand can be secured which will weather the severe storms of winter and be in fit shape to get the jump on the weeds in the spring.

Lawn seed should be sown on a calm, quiet day, if possible just before a rain, and should not be covered too deeply; a light raking or rolling will work the seed far enough into the soil so that it will readily germinate. Kentucky bluegrass germinates best when the seeds are exposed to light. As a usual thing where considerable barnyard fertilizer has been used the lawn during the initial season is a mass of weeds. However, this should not worry the owner, and he should not waste any of his time in attempting to pull the weeds by hand, with the exception of dock and other perennials, as when the grass begins to fill out the second season it easily will exterminate the weeds. Instead of pulling weeds the lawn-maker should sow

more grass seed so that more seedlings will develop to compete with the weeds for possession of the soil. Ultimately where this system is pursued the grass sprouts will stamp out all of the weeds.

Where it is necessary to apply fertilizers after the grass is started such ingredients as land plaster, bone meal, nitrate of soda and hardwood ashes should be used. A top dressing of sheep manure, three to five tons to the acre, followed by an early spring application of unleached wood ashes is excellent. The lawn that is too shaded or one that receives too much sunlight are both benefited by applications of hardwood ashes, lime and bone meal. Care should be exercised not to apply an excess of wood ashes, as they tend to develop clover at the expense of the other grasses.

The lawn needs plenty of care and attention even after its formative period has been passed; it should be frequently and regularly mowed and rolled, being sure to leave all the clippings on the ground. As soon as growth starts in the spring the mowing campaign should begin and the cuttings should be continued once or twice a week until the latter part of September. It is essential to allow the grass to attain a long growth before the winter sets in, and all the leaves and other debris which collect over the greensward during the fall should be left undisturbed until the following spring, as they form a protective mulch over the grass during the period of cold weather.

Excessive sprinkling usually accomplishes more harm than good in the development of a prolific lawn. The only effective time at which to water the grass is during the evening, and then the ground should be thoroughly soaked. Two or three thorough soakings at the required periods during the entire summer actually benefit the soil more than a half-hundred half-hearted attempts at daily sprinkling during the heat of the day. Sprinkling during the extreme heat of a clear day is particularly ineffectual as the water is sprayed in so fine a mist that the majority of it evaporates before it ever penetrates to the thirsty roots of the grass plants.

Where immediate results in replenishing the soil's phosphatic resources are desired, 150 to 200 pounds of steamed bone meal per acre may be advantageously broad-casted over the lawn. It should be applied in the spring so that the readily available plant food will be at once leached into the soil and ready for the use of the hungry roots. Where nitrogen is the limiting factor on which the lawn hinges this deficient element may be applied in the form of tankage or dried blood. One hundred pounds of dried blood per acre is a liberal application. Where the soil is decidedly deficient in potash a generous dose of 600 to 800 pounds of wood ashes to the acre will effect wonders in remedying the difficulty.

As was previously emphasized, it is of paramount importance to mow the lawn at least once or twice a week during the growing season. Instead of allowing the grass to attain a length of 1½ or 2 inches, it should be cut every time it has grown three-quarters of an inch. A grass of finer texture and a lawn of superior quality attends these intensive mowing operations. The more frequently the lawn is mowed within certain limits, the less grass there is to cut, as plant growth is proportional to its leaf area. Regular clipping and pruning will favor the development of more shoots which make for a compact, velvety sod.

You pass through this world but once; take it as you find it but leave it better.

### Practice With Science

By W. H. Waite.

The greatest agricultural society in the world has the above for its motto, and it should also be the slogan of horticulturists.

I have sometimes heard it said by good gardeners that a scientific knowledge was of no use to them. It is true that I know many good growers, who have no knowledge whatever of botany, or any of the other sciences which underly the principles and practice of horticulture and agriculture: likewise I know men who are good scientists, yet are only fair growers, yet that does not follow, that if the former had some scientific knowledge along with his good practice, he would be all the more valuable, also vice versa if the scientific man had the practical knowledge that the unscientific has, he would also be a more valuable

Nowadays, when there are a greater number of men available who have a college or horticultural school training, it behooves the gardener who wishes to reach the top of his profession to give some consideration to the

scientific side as well as the practical.

The greatest drawback to the college graduate, as we know him today, is his want of good practical knowledge, therefore, if those with a good practical training would devote part of their spare time to the study of the sciences which are most bearing on horticulture he would in my estimation be much better qualified to fill important positions.

The three principal studies which the young practical gardener should devote his time to, are: botany, chemistry

and entomology.

Some of those who have never studied botany, imagine that it is a dry and difficult subject, but to the gardener who ought to be a plant lover, as well as a cultivator, it is one of the most fascinating and interesting subjects. I know of no subject that trains the observing powers so much as botany.

The science of botany is divided into several sections, the sections of most interest to the gardener are physi-

ology, anatomy, morphology and geographical.

Physiology is concerned with the question of what a plant does, and what a plant's various organs do; in the study of physiology of plants we learn about the nutrition of plants. A plant is presented to us as a complex organism built up of a number of chambers or cells each of which has its special and to some extent independent function.

The function of all cells of the body have two common objects in view, namely, the preservation of the individual, and the production of material which may be employed in the formation of new individuals; these latter are formed in the seeds, the function of which is the

perpetuation of the species.

The leaves of the plants are concerned in the production of the necessary food material, this being effected in the green cells of the leaves under the influence of light and from the raw material, which they obtain from the carbonic acid of the atmosphere, and partly from the soil in the form of mineral salts dissolved in water.

It is the function of the roots to fix the plant in the soil, and by its root hairs to absorb from it the soluble

mineral salts.

The sudy of anatomy or the structure of plants is a necessary auxiliary to the study of physiology. In this section we learn what is the structure of the absorptive organ, the root, also the structure of the stem, with its leaves and flowers.

In the study of physiology we learn what each part of a plant does, and the study of the morphology inquires

By the accurate comparison of plants in all their members morphology aims at finding out the relationship between them, that is, constructing a natural classification of the vegetable kingdom. Classification is often treated as a separate part of the science called systematic botany and a most interesting one to the gardener, but systematic botany can only be satisfactorily based on the comparative

study of plants—that is on morphology

While it is easy to draw a sharp distinction between the physiology and morphology of plants, it is important to remember that neither can be pursued to any advantage without the other. Physiology without morphology would teach us much about the individual life of the plant, but would give us no idea of the vegetable world as a whole, or of the relationship between the innumerable species of which it is composed.

Morphology, on the other hand, would be just as barren, for the complex modifications of the organs of plants would be wholly unintelligible, without reference to the

functions to which they are adapted.

In geographical botany we learn the various parts of the world which the different plants are native of; this, for example, teaches us the uniform character of all alpine vegetation, the peculiarities of the flora of oceanic islands, deserts, etc. This also leads to important conclusions, when we study the distribution of plants, in relation to their structure and mode of life.

In the study of chemistry we do not advise the young gardener that he is to become a chemist or pharmacist. The word chemistry here means the chemistry relating to plants, soils, and manures, commonly called agricultural chemistry. For instance, the value of a soil analysis to the gardener is not to be underrated; it is extremely difficult, nay, impossible, to estimate exactly what quantity of plant food is present in a soil, in an available condition, for a plant's needs. This is best attained by experimenting with the plant itself nevertheless a soil analysis; is calculated in many cases to be of service to the gardener in guiding him as to the best treatment of his soil.

Even a partial analysis may be of great service in showing a soil's deficiency in some of the most important

ingredients such as lime, etc.

Were the discovery and introduction of artificial manures the only service which has been rendered the gardener by agricultural chemistry, it is sufficient to lay

us under a lasting obligation to the science.

Of the manures we employ, too much cannot be known; an accurate knowledge of manures will guard the practical man against the improvident waste of all the natural manures that are obtainable, thus lessening the necessity for foreign manures, by introducing greater economy in the use of those he already possesses. It will also protect him against any imposition on the part of the manure salesman and manufacturer who might sell him an article entirely unsuited to his needs.

The study of entomology is almost a necessity for a gardener these days; it trains him to be observant of the different kinds of insects that infest plants; it enables him to distinguish the injurious from the uninjurious. By knowing the life history of the insects one can use

preventative measures much more intelligently.

Had the practical use of a knowledge of entomology been as much in evidence, say, twenty years ago, as it is today, we would not have had to suffer the ravages of the San Jose scale, brown tail moth, etc., as we have had to do in the past decade. It was only because very little attention was paid to insects that these pests were allowed to go on propagating until they were so numerous as to become an epidemic.

Apart from the financial value any gardener will obtain from even an elementary study of the three subjects, botany, chemistry and entomology, he will derive a much greater enjoyment out of his chosen profession.

#### CONSERVING THE WOODLANDS.

A most interesting and instructive lecture on the conservation of the woodlands of private estates and public parks was given recently under the auspices of the Nassau County Horticultural Society, at Glen Cove, N. Y., by Mr. J. J. Levison, M. F., Forester to the Department of Parks, Brooklyn, N. Y. Mr. Levison augmented his lecture with more than a hundred stereopticon slides illustrating the various phases of his subject as he spoke on them.

Local conditions, as they effect Long Island, were given considerable attention by the lecturer during his discourse, and he warned that unless vigilance is observed the island is in danger of being visited by the gypsy and brown tail moths, both of which have already been discovered on

some parts of the island.

In the care of woodlands, Mr. Levison urged for consideration for their proper upkeep, the idea of providing an under story of trees such as hemlock and beach to take the place of the older trees as they die. Also, to protect the soil by keeping it well shaded at all times, so that the leaves falling on the ground will decay rapidly, and enrich the soil with humus. This, he said, will serve to establish a natural condition in the forest and help the old trees by conserving the moisture in the soil and enriching it as a plant food. He argued that in most parks and on most of the private estates the practice has been just the contrary. The leaves are generally raked off from year to year, and gaps between the trees are allowed to become so open that the sun gets in, dries up the moisture in the soil and allows grass to take the place of the humus.

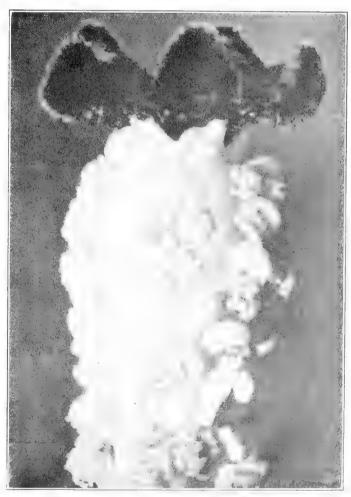

In addition to underplanting with trees, Mr. Levison recommended an extensive use of native shrubs, such as New Jersey tea, bleeding red berry, elder, dog-wood, blue beech, iron wood, etc., etc., claiming these would also aid to help conserve the moisture and soil, besides adding an especial charm to the woodland. In open gaps, where opportunity will permit he suggested additional attractiveness may be added by planting colonies of bloodroot, native ferns, columbines, etc., a method used extensively abroad.

In the treatment of diseases of trees, Mr. Levison stated that success is only possible where every trace of the fibre which penetrates from the fungi into the tree is first entirely removed and where this is not possible it is by far better to chop down the tree, than to fill the cavities. In this connection the lecturer dwelled strongly on the service of the gardener, acting in the capacity of an adviser to the estate owner, contending that the gardener should be in position to observe the need and conditions of trees so that he can keep the owner informed on their requirements. If at any time expert treatment from outside sources is necessary, it would be to the gardener's interest, as well as the owner's, to see to it that the treatment is of a justified as well as of a scientific nature. He stated that it was not his contention that the gardener should place himself in the position to assume the responsibilities of an expert, but that he should accumulate enough knowledge on the subject to be sufficiently posted to know whether the work when undertaken by the expert is really warranted.

Concluding, Mr. Levison pointed out that the proper up-keep and protection of woodland means constant attention to detail and that there is no man better qualified to give this attention than "the man on the job"—the gardener. He added that there may be times when something of technical character may develop on which the gardener may not be informed and, so, to get the proper start he should seek his advice from a well recognized authority and work in co-operation with him.

#### THE ESSENTIAL PARTS OF A FLOWER.

The accompanying illustration from the Journal of Heredity presents the essential parts of the flower, greatly magnified. At the top is the female organ, the stigma, supported on its slender column called the style. Around this style, completely enclosing it, are the many stamens, grown together into a solid tube, over the surface of which are scattered the pollen-containers or anthers. The pollen grains are seen falling from these anthers. When

ORGANS OF REPRODUCTION IN BLASCES

one of these pollen grains is carried to the stigma by an insect, a long tube grows down from the grain through the soft tissue of the style until the ovary is reached. The nucleus in the pollen grain slips down through this tube and into the egg cell in the ovary, where it unites with the egg nucleus, and the machinery of cell division is then set in motion for the reproduction of another hibiscus.

#### AN INDISPENSABLE FARM COMMODITY.

By Karl Langenbeck.

"If you could have seen this country thirty years ago when I took hold of the paper here, you would have more to say than 'fine country' for this section." A pair of snappy blue eyes looked out from the ruddy countenance of the editor as he stretched his legs and then took another pull at the porcelain pipe. "You would add, fine men to have made such a garden of this waste, for that's what it was then," he resumed.

I was erecting a denatured alcohol plant in the old German town to utilize the waste starchy stuff of the rich surrounding farms and used to loaf of an evening in the cozy print shop of the genial editor. "You see Napoleon's armies overran our country three times. They ate it bare as flocks of locusts would and carried off all the likely boys as recruits. The land had never been very fertile and there was neither spirit nor capital to reclaim it. Twenty years of Liebig's teaching had scarcely made an impression and as the farms were small, there were no educated land holders to set the pace for better methods. I saw my chance to do some good, even if there were none to make money. So, I preached soil reclamation in season and out of season, and in the fullness of time, I got my profit with that of the new race of farmers I made. And, I can say it myself, the editor added with a twinkle, for you have found I am popular; they made me a deputy in the Reichstag."

"In season and out of season," he mused. "That means

"In season and out of season," he mused. "That means more than you think. Most farmers know how to reclaim land, but few do it without a boost. When they are in the thick of work, they forget, and in the slack times, they waste themselves with regrets instead of looking forward and preparing. A little thing prepared and at hand when it's needed makes all the difference in the world in a crop. The government bulletins print their advice when the chemist is ready. The agricultural papers mostly print too much and according to the space they have to fill. They talk of pruning in the summer and harvesting in the winter. How is a man to remember? I say, week by week, what should be done now, and nothing more. I have made my paper our people's remembrancer."

Recalling this old talk of a wise man, I am reminded that I do not see on very many of our farms for ready use, a commodity that should always be on hand because of its wide and constant utility, the same as salt and sugar is in the kitchen. Its world-wide value in the work of soil improvement is thoroughly appreciated by the average agriculturist. Without its use, the maintenance and development of the fertility in most soils would be a failure. It is the cheapest and the best sweetener of churns and milk cans, it is the best germicide for the cattle stalls and hen house and the basis of the best fungicide for the fruit trees and berry bushes and it is good for much more. And, when there is some brick or stone work to put up, you need it bad, for it makes the necessary mortar. But when a man gets a carload of lime, which he does at this season, he hauls it to the fields and generally uses it all up. If not, he throws down a pile near the barn and in a month it has no value for the latter purposes which require it fresh, not air slacked. Get enough lime to put aside in tight barrels plenty of the best lump. Cover each barrel with a wet sack well tucked in. Then sprinkle fine lime all over the wet sacks. This will make hydrate and seals all pores when the covering is dry and keeps the air from the lumps.

#### DON'T! DON'T! DON'T!

That is what the children hear for the major part of their earlier lives. It is don't do this, and don't do that

and the prohibition follows them upstairs and downstairs, and into my lady's chamber, and then some; it follows them into the street, into places of public resort; and there is a whole lot of it that could well be eliminated. The absence of so many "don'ts" would add much to the pleasure of the child's life. There is a move on foot looking to this end. It is suggested that as the parks belong to the people, and primarily are designed for the use of the public, particularly for the purpose of affording the opportunity for pleasure, that we should remove the "Keep Off the Grass" and "Don't Pull the Flowers" and other such signs. We agree. That's right. Plant enough grass and flowers. Prohibition makes one want to do the thing prohibited. That is a law of nature. Let the children roll in the grass, or pull the flowers, but teach them care and consideration. We do not think the liberty will be abused. Put plenty of grass and flowers in all the playgrounds. Grass, flowers, children and birds—these go well together; a quadruple harmony than which there is nothing more beautiful on earth.

In some parts of the country this suggestion is being acted upon. Big plots of grass are planted and such an abundance of flowers as would seem to defy license on the part of the kiddies. They are calling these places the "Children's acres." It is a good name, an appealing name. It seems to us that such action will do more to awaken the sense of proprietorship and responsibility in the child's mind than any other one thing could do.

Let's have lots of "children's acres."—Dayton (O.) Journal

#### MAY.

'Mid nature's melody sublime,
 'Mong new born flowers in colors gay,
 Steps forth the stalwart son of time,
 To pay respects to young Miss May.

Afar, o'er vale and mount they climb,
 Trees clap their hands and seem to say,
 "To steal a kiss is not a crime."
 May, like a fairy queen, enchanting,
 Sets natures scattered charms to tune,
 Gallant time comes gallivanting,
 Merry May's no time to spoon.
 She is busy all day planting,
 Contemplates no honeymoon,
 Youth's demand is not her granting.
 Dayid S. Miller.

#### FINE SPECIMEN OF CATTLEYA MOSSIAE.

It was my privilege and pleasure to see, recently, what is no doubt the finest specimen of Cattleya Mossiæ in existence, or I believe of any other variety of Cattleya; not alone for size, but for vigorous health and a wealth of strong well formed flowers I believe it has no equal. The following figures are most interesting and reflect great credit both to Mr. R. D. Foote, of Morristown, N. J., the owner of the plant and to R. Lindabury, who are to be congratulated on their achievement.

The plant was purchased by Mr. Foote in 1909, and

has since borne the following record:

In the year 1910 the plant produced 59 flowers.

" " 1911 " " 26 "

" " 1912 " " 131 "

" " 1913 " " 236 "

" " " 1914 " " 270 "

" 270 " Wm. H. Duckham.

[The plant Mr. Duckham describes is reproduced from a photo on our outside cover page. It is a single plant, not made up, and has a spread of six feet.—Editor.]

### The Modernist Garden

Here a spade is no longer a spade, nor are the birds you see of the feathery kind,

The æsthetic lady gardener of today wears a costume in tune with the great out-of-doors and only the flowers are still what nature intended them to be, it seems.

The art of to-morrow has struck the gardening cult and struck it hard. The strong and steady hand of the æsthetic reformer having accomplished its winter stunt in studio and household interior has now turned its attention to the open air, and an interesting exhibition of implements and designs for the use of the amateur gardener is the result.

No more can one say with economical impulse toward the conservation of material, "Of course the old dress is nothing but rags, but I can take it into the country and use it for gardening," and sit back with that righteous feeling that one has when one has conquered the obsession to spend money.

For the gardening costumes are as complete, as expensive and as artistic as those designed for my lady's matinal shopping tour, her luncheon party, her tango tea and her dinner. Looking at them one is inclined to believe that gardening is destined to become an artificial

accomplishment, such as it was when Marie Antoinette built "Le Petit Trianon" so that she might be a charming shepherdess, and in pompadour gown, a Fragonard hat, carrying a tiny fan, she might be rowed about upon a make-believe lake.

Charming smocks, dainty gowns, embroidered blouses and gloves whose gauntlet wrists show crests and coat of arms are shown by specialists in gardening equipments.

In this same display there are wonderful baskets that look like hats and hats that look like baskets. One is tied under the chin, the other over the arm. Equipped with these you may sally forth, perchance to dig, perchance to dream, perchance to reap the harvest you may have sown, but always secure in the ethical ease that comes from wearing good clothes appropriate to the occasion.

There are also shovels, not the old-fashioned kind our grandmothers used when a spade was just a spade and a yellow primrose by the brook's brim was just a yellow primrose, but shovels that answer all the requirements of the very latest nomenclature; they will even, it is claimed by the fair owner, dig if one insists. The handles are painted in those vivid colors which, it is claimed, our souls require after the long penitential season of pastel shades or sackcloth-and-ashes-of-roses tints. When you go to plant daffodils you may have a spade to match the flowers exactly. Pink snapdragons need no longer have the soil placed about their roots by a drab or dusty gray

AN IDEAL LOCATION FOR A CITY GARDEN SPOT-IF THE "IRRIGATOR" PROVES TRUST" "THY

implement, but by one whose couleur rose is that of the blossom. Leaning on the dark blue handle of one of these, you may gaze at the cluster of dark blue larkspur at your feet while you listen to the song of the lark in the dark blue heavens.

And speaking of larks—leaving for the moment the subject of spades-birds are to be very popular in the gardens this season. One gleans this information from a garden exhibit. They are not real birds, of course; the real bird is too obvious a visitor and too closely associated with utilitarian needs, such as picking off bugs from the rose bushes. The birds selected for the garden will be as artificial as the other innovations. The shops are now displaying foreign looking bird cages made of wicker, such as one sees on the little trees that intensive farming makes possible in some tiny French garden. These are painted in some vivid hue, or gilded gayly, are bell-shaped and hold a parti-colored paroquet whose magnificent plumage makes just the right bit of color in a dreary spot of the garden or an orange and black creature with a tail that resembles one of the fashionable aigrettes and seems to gaze longingly through the wicker bars of its swaving cage, with a pathetic expression to its glass eve and a soulful droop to its taxidermatized wing.

The brilliant little humming bird that you see evidently alighting for the moment on the stalk of some old-fashioned stock is in reality a garden stick, its end stuck in the earth, its head representing some feathered song-ster; a seeming dragon fly never flies away, and a yellow oriole, the shyest of all migratory birds, remains all day firmly planted to a selected spot, and if you put out a hand to stroke its plumage he will not even chirp.

Little footstools are provided for you to sit at your task of weeding wild carrots or other pests of the farmer which sometimes stray from the kitchen garden among the flower beds. The legs are painted to match the flowers, as are the spade handles, and one can have pink, blue, heliotrope, emerald or scarlet. A ribbon handle with bow adds to the general effect immensely, and swinging from the sleeve of the flowered chintz who could cavil at the picture afforded.—Sun.

#### CULTURAL NOTES ON THE TOMATO.

By James S. Bache.

Tomatoes are one of our most important crops, not only with the truck farmer but with every one who maintains a garden from the cottager to the large private establishment which grow for their own use. It is tomatoes everywhere. What we all want to know is, which are the best varieties to grow and how to grow them. Some 20 years ago the tomato was not much heard of. Those who talked of them mostly were of the opinion that they were a breeder of cancers and unfit even for hogs. But today all this is changed; the best physicians will tell you to eat tomatoes and when you think of the many ways the tomato is used, baked, boiled, fried, stewed, canned, preserved, in so many ways it is no use trying to tell of their usages. I will leave all that to the cook and proceed to explain how to grow the tomato.

The culture of the tomato is so easy that it is often neglected. It is often the case that they are planted and left to take care of themselves, which is a great mistake. We can never get something for nothing; to grow good tomatoes the grower must give them some attention. Here is how I grow tomatoes. I sow the seed at the end of March or the second week in April in a box or pan and as soon as they show the rough leaf I pick them off in as small a pot as I can get, for this reason, to keep them stocky and short jointed, for if you give them lots

of root room and loose soil you will get rank growth which means no fruit. When six inches high they should be fit to plant out in the garden or field where the ground has been prepared for them. I find the best and quickest way to prepare the ground is to dig pits 15 inches deep at the distance of three feet apart in the rows and six feet from row to row. In these pits I put a fork of good rotten manure and a 2-inch pot of fine bone meal well worked up to the depth of 18 inches. Fill in some soil to leave the ground in a hollow to take water if required. To each plant I put a strong stake 6 feet high to which I tie my plant after I have given it the first pinch to make it give me two shoots. After it begins to grow I keep all side shoots rubbed off, not cut. Don't leave it as long as to require the knife. As you see the shoots breaking rub them out; this will save the plant from spending its strength on useless growth. When you have two or three good clusters of fruit formed it is time to feed them with some stimulant of some sort which should consist of liquid manure in the way of cow or sheep dropping well soaked in water. One pail of manure to 50 gallons of water make a good stimulant. When watering give a good drenching and at all times keep the soil well hoed about the plants to keep the weeds down and surface loose to let warmth down to the roots. Remember they are a plant that like a light, dry atmosphere to set their

BACHE'S ABUNDANCE.

blossoms and if they get crowded and shaded you will not get good results. The varieties to grow I would prefer to leave to the grower as every one has not the same taste as to flavor, color or shape, in which there is a great difference in the different varieties grown. I may say I have grown most of the best varieties in America as well as those from the other side, and by crossing I have succeeded in getting a tomato which is worthy of a trial. It has been awarded a first-class certificate of merit at Boston and it has been honored with specials and commended wherever it has been shown. It is named Bache's Abundance. You will notice in the accompanying photo that the fruit is without depression at the stem end. A fruit that is round and without ridges; a fruit that is well formed and compact; a fruit of medium size growing in large clusters. When the fruit is matured its bunches touch the soil. I consider a good tomato. Some future time I will endeavor to give some notes on the culture of the tomato under glass, and on its diseases and insect enemies, and what are the best remedies to use to keep diseases and insects in check.

### The Means of Utilizing Birds in Horticulture

Many people have absorbed the idea that birds were created to protect the crops from insect pests, but the relations of birds, insects and other forms of animal life are not quite so simple as this belief would indicate. No man, according to an address made by Edw. H. Forbush before the Massachusetts Horticultural Society, yet is wise enough to understand fully the marvellous relations and interdependences existing between the various forms of animal and vegetable life, but we know that there exist between vegetation, insects and birds what may be termed, for want of a better word, primeval economic relations, a sort of dependence one upon another; the existence of each one depending upon the existence of the others.

Birds perform the function of an aerial police force, because they are the best fitted of all the forms of animal life to concentrate quickly on any unusual irruption of insects or other lesser animals. Such an influence, working thus upon destructive or potentially destructive pests must of necessity have a beneficient relation to agricultural industries. Birds have a marvellous capacity for destroying pests. They are wonderfully active and tremendously energetic and the resultant great and constant wasting of the tissues calls for exceedingly rapid renewal. Constant fuel is required to keep the vital fires brightly burning. Hence, birds require an enormous quantity of food.

The late Chester A. Reed, author of "Bird Guide," regarded one hundred insects as the average number eaten by each individual insectivorous bird daily. He estimated by an ingenious calculation that two billion five hundred and sixty million (2,560,000,000) insects or twenty-one thousand (21,000) bushels are eaten daily by the birds of Massachusetts. I believe it was Professor Lawrence Bruner who estimated that the birds of Nebraska, a much larger State, ate one hundred and seventy carloads in a day. When we consider that a very large proportion of the insects are injurious, or would become injurious, to crops or trees if not held in check, we can see the advantage of increasing and fostering bird life. We may even reduce some of these benefits to the common standard of dollars and cents.

I hold in my hand a document, containing a message of the President to Congress, transmitting a report of the biological survey of the Department of Agriculture, in which it is stated that a single species of hawk saves the farmers \$175,000 yearly by destroying grasshoppers and field mice; and that the native sparrows of the United States save to the agriculturists \$35,000,000 yearly by destroying weed seeds. Professor F. E. L. Beal of the Department of Agriculture has made a careful study which seems to show that each pair of meadow larks is worth at least \$4 a year to the farmer, because of the grass they save by the destruction of insect pests. A friend in Bristol County, having carefully studied the work of the bob-white or quail is satisfied that each pair on his farm is worth \$5 a year to him, because of the potato beetles and other insects they destroy.

Birds are of greater potential value in the field and forest than in orchard or garden. Insecticides and other means may be used to control certain pests, but we cannot spray with poisonous showers the grass which horses and cattle eat, nor can we spray all the trees in all the woods. We are absolutely dependent on the birds and

other natural enemies of insects to protect the trees and the grass crops of the country from insect pests. Wherever birds exist in normal number, they perform this office well except where some foreign pest has been introduced which they are not accustomed to.

Something, however, may be done to utilize birds in horticulture and fruit growing, for there are many injurious insects that cannot be reached by arsenical spraying. Some which are readily destroyed by birds cannot be controlled by any practicable mechanical means now known. Birds, if attracted to an orchard in numbers, are very destructive to the principal leaf-eating insects, such as the tent caterpillar and the canker worms, the codling moth and, in less degree, to the gypsy and the brown-tail moth which our birds do not yet fully understand, although about fifty species are known to feed on one or both. Such insects can be controlled by spraying, but there are many insects which feed under the bark or in the wood, destroying the tree, which cannot be reached by spraying, for example, the introduced leopard moth. Fruit growers know how dangerous a pest it is, but there is little fear that there will be any great loss from this insect in the country at large, provided we are able to foster and increase the stock of native insectivorous birds. Nuthatches save the orchardist thousands of dollars in one season.

The principal means of utilizing birds in horticulture are to attract them to the spots where they are needed and to protect them there and, if possible, increase their numbers. Owls are among the most beneficial of all birds because they destroy mice and nocturnal insects, particularly field mice, which are very destrucive to trees and crops. All European writers who have observed the habits of the owls agree that they are wonderfully useful in this respect. Our larger species, such as the great horned owl and the barred owl sometimes molest poultry and game, but the smaller species almost never pursue fowls or pigeons except when driven by stress of weather and starvation. The screech owl may often be induced to make its home on a farm by putting up a uesting box for its accommodations. A box twelve inches square and fifteen inches high with an entrance near the top four inches by five would be ample for a family of screech owls, and such a box as this was chosen by a pair of screech owls near my orchard. In this they reared their young and while there destroyed all the mice about the

In conserving small birds, it is well, so far as possible, to secure the services of their natural protectors. Kingbirds, while quarrelsome, act as protectors to other small birds by driving away crows and hawks. Kingbirds may often be induced to nest in the orchard by hanging our branches or fences a plentiful supply of cotton string cut in lengths of one foot. This sometimes will induce ortoles to nest. Martins also drive away hawks.

Some few experiments have been made with birds in greenhouses by introducing them there as protectors of the plants. In one such case, some juncos and tree sparrows, shut in a greenhouse in the fall and kept there during the winter, absolutely destroyed a pest of plant lice. Hummingbirds are serviceable among flowering plants, not only because, like the bees, they distribute pollen, but also for the reason that they feed on many of the minute insects of the plants and flowers, some of which may be too small to escape the notice of other birds. Hummers may be readily attracted by planting bee balm, honey-suckle, or almost any deep, bell-shaped flower.

Vol. XVIII.

MAY. 1914.

No. 1.

The CHRONICLE is not given to sounding the praises in its columns which others may bestow on it, as it always has felt that space this would occupy can be utilized for more interesting matter to our readers. Let it be understood, however, that our readers are no less appreciative than those of our contemporaries' columns in lauding us as "You are the best ever," "You can't be beat," "I cannot do without you." Of course, we like to receive such expressions of commendation and herewith acknowledge them collectively; but, kind reader, if you do not see your complimentary manifestation in print, do not believe us to be any the less appreciative for it. We can say with all candor, that the many congratulatory messages which come to us are as straws indicating that the CHRONICLE is making a gradual and steady growth as an influencing factor in the horticultural world. Can you not observe it?

Mr. Gardener, it is not too soon to plan for the 1915 spring show to be held in New York. The private grower was much favored in the last two spring events in New York, and a glance at the make-up of next year's Flower Show Committee printed elsewhere in these columns should make it self evident that the gardener's interest will again be safeguarded.

He is not asked to underwrite the guarantee fund, to contribute to the expenses of the show or to assume any obligations, except to prepare in ample time to lift the generous prizes which are again to be offered. This obligation he should faithfully assume.

#### THE GLORY OF THE GARDEN.

Our England is a garden that is full of stately views, Of borders, beds and shrubberies and lawns and avenues, With statues on the terraces and peacocks strutting by; But the Glory of the Garden lies in more than meets the

For where the old thick laurels grow, along the thin red

You'll find the tool- and potting-sheds which are the heart

The cold-frames and the hot-houses, the dung-pits and the

The rollers, carts and drain-pipes, with the barrows and the planks.

And there you'll see the gardeners, the men and 'prentice

Told off to do as they are bid and do it without noise; For, except when seeds are planted and we shout to scare the birds.

The Glory of the Garden it abideth not in words.

And some can pot begonias and some can bud a rose, And some are hardly fit to trust with anything that grows; But they can roll and trim the lawns and sift the sand and

For the Glory of the Garden occupieth all who come.

Our England is a garden, and such gardens are not made By singing:—"Oh, how beautiful," and sitting in the shade,

While better men than we go out and start their working

At grubbing weeds from gravel-paths with broken dinnerknives

There's not a pair of legs so thin, there's not a head so thick,

There's not a hand so weak and white, nor yet a heart so sick.

But it can find some needful job that's crying to be done, For the Glory of the Garden glorifieth every one.

Then seek your job with thankfulness and work till further orders,

If it's only netting strawberries or killing slugs on borders:

And when your back stops aching and your hands begin to harden,

You will find yourself a partner in the Glory of the

Oh, Adam was a gardener, and God who made him sees That half a proper gardener's work is done upon his

So when your work is finished, you can wash your hands and pray

For the Glory of the Garden that it may not pass away! And the Glory of the Garden it shall never pass away! RUDYARD KIPLING.

#### NATIONAL ASSOCIATION NOTES

M. C. EBEL, Secretary, MADISON, N. J.

#### THE CO-OPERATIVE MOVEMENT.

A number of the local societies have appointed their co-operative committees in response to the communication sent out by the National Association last month, requesting that such action be taken by the organization desiring to co-operate with it. Those societies which have not yet taken action but which intend doing so, and those which have already done so but have not yet reported to the secretary of the association, will confer a favor on the National Committee by acting at their earliest convenience, and by sending the names of those elected from the committee to M. C. Ebel, secretary, National Association of Gardeners, Madison, N. J.

#### THE BY-LAWS IN PAMPHLET FORM.

The revised By-Laws of the association have been published in pamphlet form and are ready for distribution to all members who may desire a copy. A card to the secretary's office asking that a copy be sent will receive attention and a copy of the By-Laws will be forwarded.

#### THE SERVICE BUREAU.

The association's service bureau has recently had many inquiries for first class assistants, but has found difficulty in filling the positions, in fact several of them are still unfilled at this writing, due, it seems, to a scarcity of capable men willing to act in assistants capacities. On the other hand there are many young men about, all seeking head gardeners' positions, of which there are a decided scarcity just at this time. The young men, if efficient to fill the position of head gardener or superintendent are to be commended for their ambition to improve themselves, but remember the old adage: "A bird in hand is worth two in the bush"; and, so, the young man may frequently be far better off holding down a good assistant's position and awaiting his opportunity for betterment, than to give up a good position to go out to seek his opportunity with nothing definite in view.

### SPRING FLOWER SHOW FOR NEW YORK IN 1915.

All arrangements have been completed for another spring show in New York, the date agreed on being March 17 to 23, 1915. Organization was completed early this month, the 1915 Flower Show Committee being constituted as follows: Frank R. Pierson, chairman; T. A. Havemeyer, vice-chairman; John Young, secretary; Fred. R. Newbold, treasurer; Chas. H. Totty, Wm. H. Duckham, James Stuart, Wallace R. Pierson, Jos. A. Manda, M. C. Ebel, Julius Roehrs, F. L. Atkins, Frank H. Traendley, Geo. V. Nash, Prof. N. L. Britton, Wm. H. Siebrecht.

The committee has already held several meetings to prepare the schedule which it hopes to have ready for distribution early in June. It is the committee's aim to have more groups and massive plants at next year's show than were seen at the previous shows. Many other new features are also to be introduced to make the show the most attractive of any ever held in this country.

#### AMONG THE GARDENERS

James F. Slimon, for many years manager of J. M. Thorburn & Co., later of Vaughan's New York store, and more recently holding a similar position with Grant F. Lippert, died at his home in Brooklyn on May 8, in his 51st year. Mr. Slimon numbered a host of friends among the gardening fraternity who will be grieved to learn of his untimely demise.

- D. L. Mackintosh was recently appointed chief horticulturist at the Minnesota State Prison, Stillwater, Minn. Before going west some years ago, Mr. Mackintosh was superintendent of Bellwood Farm, Geneva, N. Y., but he has since become a firm believer in big future opportunities for the gardener in the Northwest.
- W. D. Nickerson, gardener on the estate of M. T. Jones, at Houston, Texas, will come North to take charge of the Jones summer home at North Conway, N. H.
- R. W. Fowkes, who was appointed gardener on the Howard Cole estate, Madison, N. J., this spring, is now in full charge of that place.
- J. C. Shield writes under recent date that everything in the section of Monticello, Ill., is looking splendid, and that they expect to pick fresh peas, etc., about the 30th, which will be only five days later than usual.

Wm. Plumb, chief of horticulture of the Panama-Pacific Exposition, assumed the duties of his position on May 1st.

N. Butterbach has been appointed general superintendent of the new B. B. Ward estate, New Rochelle, N. Y.

William Allan, formerly gardener to Dr. Jacobs, has accepted a similar position on the estate of Mrs. Geo. D. Widener, of Newport, R. I.

Forward Application to M. C. EBEL, Secretary, Madison. N. J., with dues, which are \$2.00 annually, including subscription to the official organ of the Association.

#### A RECORD UNIQUE

The little town of Lenox is justly celebrated for several things, notably its beautiful scenery, magnificent country homes and its literary associations. But there is another feature which will interest the horticultural and agricultural fraternity, and that is, the men who have charge of the Lenox estates, who for some reason which seems peculiar to the locality, "stay put," a characteristic which has become so marked that a New York seedsman is responsible for the assertion that the Lenox superintendents "neither die nor resign." That this statement may be a trifle overdrawn in the first part we will not attempt to deny, but we submit that there are few localities in these United States or in the world which can match our record. For we have within a radius of three miles twenty-seven estates of varying size, the superintendents of which have an aggregate of five hundred and forty years service to their credit, or an average of twenty years each. And if we select ten of the long service men they average thirty-one years each. Nearly a dozen have been the only occupants of their position, having been there from the beginning of the place as a country estate and some have held their position under several owners, apparently being like Tennyson's "Brook," for owners may come, and owners may go but they go on for ever. Some may argue that staying long in one place tends to make a man narrow, or moss-grown. Be this as it may, long and faithful service has ever been looked upon with some measure of respect the world over and employer as well as employee may well be congratulated upon a condition so honorable to all parties.

We feel that the accompanying photograph would be incomplete without a few words about the men and the estates they manage, so we will commence with the dean of the corps, John Baker, who is seventy-five years young, straight as an arrow and as active as a youth: he has had charge of "The Dormers," Mrs. R. T. Achmutys' estate,

for more than forty-five years and is an allround farmer and gardener. Our next veteran is William Henry, who for forty years has "gardened finely" at Groton Place. the estate of Mr. Grenville L. Winthrop, where there is a very fine Italian garden, extra fine hardy trees and a very interesting orchard of dwarf fruit trees. James Feeley is quite in the running with thirty-eight years at Wyndhurst, the estate of the late John Sloane. Mr. Feeley's specialties are pedigreed cattle, poultry, orchards, vegetables and all the rest that goes to make the products of a complete country home. Charles Mattoon is in the same class, having for thirty-eight years had charge of the Morgan Farm on the Ventford Hall estate. Alexander McConnachie, who is now for the second time president of the Lenox Horticultural Society, has been at "Tanglewood," Mr. Richard C. Dixev's place, for the last thirty-three years, gardening and farming. Mr. John M. Hughes is our next subject, and he has been at "Wayside," the estate of Mrs. Wm. H. Bradford, for thirty years. Rudolf A. Schmidt has been at "Sunnycroft," the estate of Mrs. G. G. Haven for twenty-six years, and in addition to being an expert horticulturist has been very successful with poultry. E. J. Norman is rapidly approaching the quarter century mark as superintendent of "Erskine Park," the estate of the late George Westinghouse. Here are lawns of nearly a hundred acres in extent and miles of drives as well as powerful fountains which play every day in summer, and Mr. Norman has had the making of it all. A. H. Wingett is likewise getting very close to the quarter century mark as superintendent of "Allen Winden," Mr. Charles Lanier's estate. Mr. Wingett is a delegate to the State Board of Agriculture, where he very ably represents the Lenox Horticultural Society. George H. Thompson was unavoidably absent when the photo was taken, but was worthily represented by George H., Jr. Mr. Thompson has had charge of "Wheatleigh," the estate of Mr. Carlos De Heredia for some twenty-two years and has been

Reading left to right the names are: Front row-Walter Marsden, Thomas Proctor, E. J. Norman, John M. Hughes, A. McConnachie, Wm. Herry, John Baker, James Feeley, Cl. 8 Matten.

Second row -Wm. Tirrell, John Kiah, David Dunne, F. H. Butler, Walter Jack, John Donahue, R. A. Schmidt, Harry Herreman.

Third row-George H. Ferguson, A. J. Loveless, Alex. McLeod, Frederick Herremans, A. H. Wingett, George Foulsham, Edwin Jenkins, S. Carlquist, Robert Purcell, George H. Thompson, Jr.

there ever since the place was started. "Wheatleigh" is noted for its beautiful Italian gardens, fine coniferous trees and the production of high class vegetables.

Frank H. Butler has been twenty-two years superintendent of "Interlaken," the estate of Mrs. John E. Parsons. Mr. Butler has been selectman for the town of Lenox for many years and the estate he manages has always been noted for its excellent collections of herbaceous plants. G. W. Ferguson is another of our city fathers and has had charge of "Pinecroft" for a score of years. "Pinecroft" is the estate of Mr. F. A. Schemerhorn, and Mr. Ferguson made it famous by raising a record crop of wheat a few years ago. A. J. Loveless has nearly a score of years to his credit as superintendent of "Wyndhurst Gardens," the estate of Mrs. W. E. S. Griswold. Mr. Loveless has always been a heavy prize winner at all the exhibitions and has done some good work in hybridization of amaryllis and orchids. John Krah has been nineteen years in charge of "Coldbrooke," the estate of the late Captain John S. Barnes and has always been to the front with the good things of horticulture and agriculture. John Donahue has seen nineteen years at "Belvoir Terrace," Mrs. Morris K. Jessups' place. Mr. Donahue succeeded his father, the late P. J. Donahue, who was widely known as a clever landscape gardener, and "Belvoir Terrace" is a fine example of his work.

Walter Marsden superintends "Sunnyridge," the estate of Mr. George W. Folsom, and has done so for eighteen years. Here are interesting old fashioned gardens and superb lawns. Edwin Jenkins has been at "Bellefontaine," the estate of Mr. Giraud Foster, for seventeen years. Sigerd Carlquist has had charge of "Ethelwyn," Mrs. Robert Winthrop's place, for thirteen years and has always been in the forefront at the shows with grapes, carnations, chrysanthemums and vegetables. Thomas Proctor has been at "Blantyre," the estate of Mr. R. W. Paterson, for something over thirteen years, and in that time "Blantyre" has become famous for its chrysanthemums, orchids and its conservatory, which is always bright with whatever flowers are in season. The work of laying out "Blantyre" was largely planned and entirely carried out

by Mr. Proctor.

"Elm Court," the estate of Mr. W. D. Sloane, is one of the largest and best appointed places in the country, and is under the able superintendence of Frederick Herremans, where he has been this eleven years past. Mr. Herremans is an expert exhibitor especially of plant groups for effect, in which he is seldom defeated. Walter Jack has been at "Sprinklawn," the estate of Mrs. John E. Alexandre, ever since its beginning some eleven years ago, and is strong on annuals, early vegetables and all kinds of hardy plants. David Dunne has been at "Clipston Grange," the estate of Mr. Frank K. Sturgis, for eleven years, and a glance at the place will convince any one that an able gardener is in charge. William Tirrel is another eleven year man and like many of the others it is not his fault that he has not a longer period of service to his credit, for he has been at "Pine Needles" ever since the owner, Mr. George Batty Blake, started the place. George Foulsham is likewise deprived of the honor of having served a, few score years by the fact that Mr. W. B. O. Field, the owner of "Highlawn," only opened up the place some five years ago. This fact has not prevented Mr. Foulsham from showing up strong at the summer shows with sweet-peas, perennials and annuals

Robert Purcell has been at "Eastover," the estate of Mr. Harris Fahnestock since its beginning some four years ago. This place promises to rank high among the Lenox gardens. Harry Herremans is one of the juniors, having been at "Edgecombe," the estate of the Misses

Furnisses, for about three years, and Alexander McLeod is another of the newcomers, he having charge of "White Lodge," the estate of Mr. Albert R. Shattuck.

#### A HORTICULTURAL INVESTIGATION.

The Bureau of Plant Industry, of the United States Department of Agriculture, has undertaken to conduct a campaign of investigation on the behavior of ornamental plants in all parts of the United States, and as much information as is possible to obtain is naturally desirable on the actual behavior of the plants in different localities. With this in view, a form for the recording of the desired information has been prepared, which will be supplied to anyone signifying a willingness to co-operate in the work.

The information asked for covers the time of opening and dropping of leaves and flowers, and coloring and

dropping of fruit when there are any.

F. L. Mulford, Landscape Gardener of the Bureau of Plant Industry, in charge of the investigation, believes that the gardeners of America are in a position to materially help the department in this work and he invites them to co-operate in it to the lmit of their available time. Those who can assist in the investigation should immediately address themselves to F. L. Mulford, Landscape Gardener, Department of Agriculture, Washington, D. C., and they will then be supplied with the necessary blanks and instructions for gathering the information that is being sought.

In co-operating with the United States Agricultural Department in this cause the gardeners will indirectly benefit themselves as the accumulated information will be properly compiled and the records will be filed as a future reference; so that it will be possible for the gardener to inform himself on the habits of the different ornamental plants in the various localities of the country, and not find it necessary, as he frequently does now to plant and then learn, by experience, that certain plants are not adaptable for the surroundings in which they are planted.

#### AN INTERESTING EXHIBIT.

To those particular appreciative lovers of rare greenhouse flowering plants the following will bring back to the memories of those who had the opportunity to view the numerous exhibits of Acacias, Ericas and Boronias at the International Flower Show which was held in the latter part of March in New York, what a fine display they were.

It must have been most pleasing for the many British gardeners in particular, who visited this show to note the increasing number of entries made this year over last, and the most pleasing part of it is that ninety-nine per cent. of all the plants were American grown, and there-

fore not imported or grown in Europe.

I was over-joyed at the very fine collection staged by the Knight & Struck Company of Flushing, New York, for which they were awarded the first prize.

In this group I noticed several very fine plants, among

which I mention the following few:

Which I mention the following few:

Hardenberghia Monophylla; a beautiful dark mauve

Choysia Ternata; with its sweet scented orange blossom-like flowers.

Boronia Elation; bearing innumerable cherry cerise oval flowers.

Boronia Megastigma; chocolate colored sweet scented flowers.

Splendid plants of *Coronella Glauca*; showing masses of glistening bright yellow flowers.

Magnificent seven-inch pots of well-flowered Chorozema Cordate Variety Spiradens.

Special mention is to be made of the beautiful Bauera Rubioides; dozens of well-flowered specimens were to be

Among the Acacias, I noted A. Cordata; a dwarf species, cat-tailed spikes of light yellow flowers; A. Longifolia, A. Heterophylla, A. Floribunda, A. Cultriformis, etc.

Among the most noteworthy varieties of Ericas, I was delighted to see some Erica Transluscens; fine specimens in eight-inch Asalea Pans, bearing eight to nine spikes of pink-tubed flowers; Erica Sindryana, also called the Blue Heath, long-tubed variety; elegant plants of Erica Cavendishii, the yellow heath; Erica Perspicua Erecta, the white-tubed variety; also elegant specimens of Erica Persoluta alba and Rosea; Erica Barbata; and hundreds of Erica Cupressiana, a dwarf heath bearing innumerable clusters of pink bells.

I understand this firm grows some twenty distinct varieties of Ericas, devoting some ten houses to their culture exclusively. I had occasion to visit their establishment last fall, and I must admit my surprise to view the enormous stock they had on hand at that time.

HENRY LE CHEVALIER.

#### THE AMERICAN SWEET PEA SOCIETY'S PRELIMINARY SCHEDULE OF PRIZES FOR THE SUMMER EXHIBI-TION, TO BE HELD AT THE MUSEUM OF NATURAL HISTORY, NEW YORK, IUNE 27 & 28, 1914.

The Henry F. Michell Company's Prizes. For the best six vases of Sweet Peas, 25 sprays, and a vase of six distinct Spencer varieties, the Mitchell silver medal. For the best 25 blooms Sweet Peas, Apple Blossom, Spencer with foliage, the Mitchell silver For the best vase Sweet Peas, Spencer varieties mixed with foliage, not less than 100 blooms, the Mitchell silver medal.

Messrs. R. & J. Farquhar & Co.'s Prize.—Best bridal bouquet of Sweet Peas, Gypsophila sprays or foliage other than that of the Sweet Pea may be used. (Private gardeners only.) Three rizes. First prize, \$10; second prize, \$6; third prize, \$4.

The Knight & Struck Company's Prizes.—For the best vase

of Sweet Peas, containing 25 sprays, of which no two are alike in shading. First prize, \$25; second prize, \$15; third prize, \$10.

The Peter Henderson & Co.'s Prizes (for Private Gardeners) .-For the best 12 vases, 20 sprays to vase, of 12 distinct varieties of Spencer Sweet Peas. First prize, \$25; second prize, \$15; third prize, \$10.

The Peter Henderson & Co.'s	Prizes (for Amateurs Only).—
Best vase 12 sprays white Spence	r Sweet Peas \$5.00
Best vase 12 sprays pink Spencer	Sweet Peas 5.00
Best vase 12 sprays lavender Spe	ncer Sweet Peas 5.00

Sweenstakes.—To the winner of	f the greatest number of Peter

Henderson & Co.'s amateur prizes, \$10.

Messrs, Burnett Brothers' Prize.—A silver cup, value \$25.

The W. Atlee Burnee Cup (Value \$25).—For the finest 12 vases of Smoot Poor 19 process.

of Sweet Peas, 12 varieties. The W. Atlee Burpee Prize.-For the best vase of one variety

of Spencer type Sweet Peas introduced 1914. First prize, \$5;

second prize, \$3; third prize, \$2.

The W. Atlee Burpee Prize.—For the best vase of Grandiflora type Sweet Peas, one variety. First prize, \$5; second prize, \$3; third prize, \$2.

The Arthur T. Boddington Prize (Challenge Silver Cup, Value \$50).—For a collection of Sweet Peas, 25 varieties, not less than 25 stems to a vase, to be shown with Sweet Pea foliage only. To be won twice by the same exhibitor. There will also be awarded to the winner of this cup (each time won) a cash prize

The C. C. Morse & Co.'s Prize (A Silver Cup, value \$25).—For the finest display of Sweet Peas. Open to the seed trade only.

Messrs. Stump & Walter Company's Prize.—For the best six

vases of Sweet Pears, six distinct Spencer varieties, 20 sprays to the vase. First prize, \$15; second prize, \$10; third prize, \$5. For private gardeners only.

The Henry A. Dreer Prizes .- For the best vase of Florence Nightingale Sweet Peas. First prize, \$3; second prize, \$2. For

the best vase Queen Alexandra Spencer, Sweet Peas; first prize, \$3; second prize, \$2. For the best vase white Spencer Sweet Peas; first prize, \$3; second prize, \$2.

The Mount Desert Nurseries Prizes .- For the best vase of Sweet Peas, one variety, any color, 25 stems arranged for effect, any other foliage than Sweet Pea may be used. First prize, \$7.50; second prize, \$2.50.

Mrs. Sutton & Son's Prize (A Silver Cup, value \$25).-For the best table of Sweet Peas to be arranged on a space 4 by 3 feet and not to exceed 3 feet in height. Sweet Pea foliage or Gypsophila, or both, can be used.

The Watkins & Simpson Prize.—For the best six vases Spencer

or Unwin Sweet Peas. First prize, \$10.

The American Sweet Pea Society's Prize.-For the best display covering 24 square feet; Sweet Pea or other foliage can be used. First prize, The American Sweet Pea Society's silver medal and \$25; second prize, The American Sweet Pea Society's bronze medal and \$15.

The American Sweet Pea Society's Prizes.—For the best 12 vases of Sweet Peas, 12 varieties, 10 sprays to a vase. First prize, \$12; second prize, \$8; third prize, \$4.

The American Sweet Pea Society's Prizes.—For the best six

vases of Sweet Peas, 6 varieties, 10 sprays to a vase. First prize, \$6; second prize, \$4; third prize, \$2.

The American Sweet Pea Society's Prizes.—For the best three vases of Sweet Peas, 3 varieties, 10 sprays to a vase. First prize,

\$4; second prize, \$2; third prize, \$1.

Sweet Peas.—Decoration for table of eight covers; glasses, cutlery and linen to be used. First prize, \$25; second prize, \$15; third prize, \$10. Exhibitors shall be allowed to use Sweet Pea foliage, asparagus, smilax, Gypsophila or all. Ribbons also allowed.

	vegetables		\$4.00	
Class 99.	vegetables		Cup.	

### NEW APPOINTMENTS AT CORNELL UNIVERSITY.

Dr. Beverly T. Galloway has been appointed Dean of the New York State College of Agriculture. He succeeds Prof. L. H. Bailey.

Dr. Galloway, who is 50 years of age, has been engaged in floricultural, horticultural and agricultural pursuits since he has been a young man, and has been connected for many years with the United States Department of Agriculture, rising to the position of Assistant Secretary of Agriculture, to which he was appointed about a year ago, and which position he has just resigned to assume the duties of his new appointment.

He possesses all the qualifications to fit him for his new office, and Cornell University is to be congratulated on the selection made by its board of trustees in the appointment of Dr. Galloway.

At a recent meeting of the Agricultural Council of Cornell University two appointments were made to the staff in the Department of Floriculture. These were the appointment of David Lumsden, of the New Hampshire College of Agriculture, as assistant professor of floriculture, and Clark L. Thayer, of the Massachusetts Agricultural College, as assistant in investigation. Mr. Lumsden comes to the university splendidly fitted for the work. He is a man of wide experience, of pleasing personality, and speaks easily and clearly. He is a graduate of the Sleaford Collegiate School of London, England, and also of the Veitchian School of Horticulture where he specialized in floriculture. For a number of years he was employed in glass houses on private estates in England, and for two years before coming to America was in charge of the glass-house department for growing flowers and fruits and also in charge of the room and table decorations for the Duke of Westminster, from whom he holds a testimonial of high efficiency. Since coming to this country nineteen years ago, Mr. Lumsden has spent thirteen years in practical work on commercial places and six years at the New Hampshire Agricultural College where has has been in charge of the work in floriculture

Mr. Thayer is a native of Enfield, Mass., and a graduate of the Massachusetts Agricultural College in the class of 1913. During the past year he has been doing graduate work at the Massachusetts Agricultural College and has assisted in the teaching. The short courses during the past winter were under his direct supervision. Mr. Thayer will study for an advanced degree at Cornell and assist in investigational work.

The staff of the Department of Floriculture at Cornell is now the largest of any in the United States. It consists of the following: Professor Edward A. White, head of the department; Dr. A. C. Beal, professor of investigation; David Lumsden, assistant professor; Roland H. Patch, instructor; Alfred C. Hottes, instructor in investigation; Miss Lua A. Minns, instructor; Clark L. Thayer, assistant in investigation; Miss Julia Z. Kelly, secretary and curator; Arthur B. Cornelius, gardener; David Murray, assistant gardener.

The CHRONICLE is at the disposal of any person who may desire to subscribe for it. Your address, with one dollar, sent to GARDENERS' CHRONICLE, Madison, N. J., will bring the CHRONICLE to you for one year.

#### THE BEAUTIFUL COLUMBINES.

It is strange that such attractive and hardy flowers, so radiantly beautiful, should receive so little attention.

They are easily grown, require but little effort, and repay all care and labor needed, a hundredfold. Light itself has been dissolved, and all its prismatic rays have been woven into their bloom. I think one trouble has been that they have not been planted on a scale large enough, and in generous masses, so that their charms could be seen to advantage.

People persist in getting a lovely flower, and giving it the task of enlivening dreary surroundings, and the poor thing cannot show to advantage.

Then no single one, beautiful as it may be, can represent them all.

Does one realize what a great family they are, over fifty native species? No flowers hybridize more readily. You secure a large variety, and then sow seeds from these, and you have a marvelous permutation of beauty.

No two flowers of this so-called crop will be entirely alike.

The bumble bees, especially, delight in their nectar. They seem almost intoxicated as they revel in it. Of course, they carry the pollen from one flower to another, and the result is something new. There is an intense fascination in watching the various changes wrought, and to see the bewitching loveliness of some of the new arrivals. If one could sort out some of these and name and describe them, he could give some rare treasures to the floral world. By this process you would have the pleasure of forming new acquaintances whom no one

else has yet met.

Let us take a look at some of them. The Chrysantha the golden. The color is vellow, and not only that, there is a good deal of it. It is intense as though the flower had secured all it could, and had packed and pressed it together, in the most lovely form imaginable. What long and delicate spurs it has! We saw it growing wild in the Yellowstone National Park. There, it was small and comparatively insignificant; but, transported, with good cultivation, it gives grateful response to kindly attention. A flower does not blush as well unseen, while it "wastes its fragrance on the desert air," as when there are admirers, to appreciate its beauty. Many a flower comparatively unattractive in its wild state, will bloom in a prodigality of loveliness, under the influence of cultivation, and where it can be seen and enjoyed. The Picea Pungens, the king of beauty among the conifers, nowhere in all the mountains, does as well, as when transplanted in the rich soil of the prairie or eastern states, and receives the attention it deserves. Then the needles are longer, and the sheen is far brighter, and more radiant than in its own habitat.

There is another of attractive appearance, with long and delicate spurs. The petals are snowy white and intense blue. It seems a photograph of the sapphire of the sky and the fleecy clouds. This is the Coerlia of the Rockies, and the state flower of Colorado. We often see these in masses at an altitude of eight or nine thousand feet. In many places they grow to great size, as some localities seem better adapted to their development than others.

When taken down to the plains they need some shelter from the burning sun and hot winds. This variety really hybridizes with others, and its motherhood is seen in many types in recent years. So readily does it cross, that though the original plants will be all right, yet the progeny varies so readily, and to such an extent, that pure seed must be secured from the mountains if you would be sure.

It is a large, solid flower. It has no spurs whatever. It is quilled like the dahlia. Another is salmon pink, lined with white, a gorgeous flower, and the blooms hang like lamps in a chandelier, around the parent stem. Here is one that is large, compact, snowy white. It is a full and prodigal bloomer, and near it, is a single white, well spurred. In close proximity, is one of deep blue, a single flower, with long, slender spurs, much like the Coerlia, to which it probably owes its parentage. In the crossing, it doubtless got enough of the blue, from one of those of deep azure to eliminate the white.

Time would fail to describe them all. The Golden is less liable than others, to enter into crosses. One reason is, that it is so much later, and yet there are several that show its influence, and many of the golden ones have been somewhat swerved from their distinct form.

These flowers commence blooming with the tulips, and continue to flower for two months, while the Chrysantha will break out, now and then, all summer.

Imagine, if you can, a blend of these charming colors, in a mass of several hundred, some early, others late, some single, others double, many of them tall and others dwarfs. In color from purest white to deepest purple.

#### HOW TO GROW THEM.

Get a quantity of mixed seed, and sow early in the spring. The seeds are small and, of course, must be planted shallow. But here is the trouble, the ground dries before the seed can germinate. Contrive some way to keep the surface wet all the while, day and night, till they come up. But you would better trust to experts, who make it their business, and buy the plants, which can be had at very reasonable rates, and thus save a good deal of care and vexation, and a year's growth, as they will bloom some the first season.

Put in rows eighteen to twenty-four inches apart, and twelve to eighteen inches, in the row, and they will soon

stool out, and cover the ground.

It is better to mulch well with coarse manure, after the ground freezes, and in the spring rake it between the rows.

#### GLEN COVE VS. OYSTER BAY.

A bowling contest was held at Ryders Alleys, Oyster Bay, Friday, May 8, 1914, between teams of five men a side, from Glen Cove representing the Nassau County Horticultural Society andl five from Oyster Bay representing the Oyster Bay Horticultural Society, best two out of three games. Ovster Bay won, taking two straight games. James Duthie, of the Oyster Bay team, was high man in both games. A return match was played at Allchins Alleys at Sea Cliff, May 18, 1914, same teams and terms, when Oyster Bav again won in two straight. Ernest J. Brown, of Glen Cove, made high score in the match, but later in the evening Francis A. Gale, of Ovster Bay, beat his score, making 200. However, if all the Glen Cove boys had done as good bowling as Brown, they would undoubtedly have won the match. A peculiar coincidence is that the Glen Cove team is made up of four Englishmen and one Scotchman, while Ovster Bay has four Scotchmen and one Englishman, and perhaps the two Scotch pipers which the Oyster Bay boys took to Sea Cliff with them may have had a good deal to do with their winning. We certainly had the bag pipes skirlin' and made the rafters ring and jist for the sake o' Auld Lang Syne. We filled our cups and "Hoot Man" bowled IAMES DUTHIE.

### Pruning For Fruit

By V. R. Gardner.

Our primary object in maintaining an orchard is to take from it year after year the largest possible quantities of fruit of the best possible grades and at the lowest practicable costs. It is because of this that we cultivate, fertilize, thin, spray, prune and otherwise care for the trees. This being true, the value of any particular orchard operation or practice can be—and should be—measured by the way in which it influences yield, grades and cost of production.

If then we ask the question, "Why do we prune?" our answer is that fundamentally we prune to get more fruit and better fruit, to increase quantity and quality. At this point it may be objected by some that we also prune to secure a certain shaped tree. That, however, is a matter of training, and pruning should not be confused with training. Training has to do with the shaping of trees, with making them assume one form or another.

We train trees with open or close centers; with round, spreading or flat tops; with many or few scaffold limbs; with high or low heads. Training does not have to do directly with the functioning, with the behavior, of the tree. A tree trained with an open center may be much better adapted to a certain soil, a certain slope and a certain amount of humidity than a close centered tree of the same variety. The reverse may be true of the same variety under an entirely different set of conditions.

But whether in training we secure a good shape or a poor one for a certain variety, under our conditions, training has to do primarily with form. On the other hand we prune trees to so modify, to so control, their fruit habits that larger and more regular crops of better fruit will be borne. In other words, we prune to modify function.

Broadly speaking, we can control the fruiting habit of fruit trees only in so far as we can control their machinery for fruit production. The flower is usually regarded as the mechanism that the plant constructs for the ultimate purpose of fruit and seed formation, but flower formation depends, to a very large extent, upon the number of flower spurs, or, as we call them, "fruit spurs," and upon their behavior.

This is practically the equivalent of saying that the fruit spur is the real machine through the operation of which fruit is manufactured. Possibly exception may be taken to this in the case of bearing on one-year-old wood, but this rather extraordinary habit of some varieties of apples and pears is not general enough to seriously conflict with the statements made. At any rate, the fruit spur is the mechanism that the tree usually employs in its work of fruit bearing.

Without doubt many factors influence the initial development and the later health and vigor and regularity of functioning of fruit spurs. Indeed there are good reasons to believe that most of our orchard practices, such as cultivation, fertilization, spraying, the use of cover crops, etc., influence them either directly or indirectly. Pruning, however, has generally been looked upon as a practice through which we directly influence fruit spurs. All fruit growers know that they can prune them out and thus reduce their number. Many believe that by this or that pruning practice they can stimulate their formation or possibly increase their vigar or lengthen or shorten their life, etc.; and these beliefs are founded upon careful observation and experience.

The trees in some orchards are full of fruit spurs; those of other orchards are relatively much fewer in number. The individual fruit spurs in some orchards

average an apple or a pear once every two or three years; those in other orchards average a fruit only once in four or five or six or eight or even ten years. The average length of life of the fruit spur in some trees may be three or four years; in others thirty or forty years. These are extremes, of course, but they represent facts regarding the fruit manufacturing machinery in our orchards.

The health, vigor and longevity of the fruit spur depend upon its food and moisture supply and upon the amount of sunlight that it receives. It is possible for a tree to be so situated that there is not enough moisture and food present to supply properly all the spurs and their developing fruits. It is also possible for the upper and outer limbs to be so numerous and the growth they make so dense that many of the inner and lower branches, with their fruit spurs, receive insufficient light to keep them thrifty. Later these shaded spurs die off and the fruiting area of the tree is thereby reduced.

Under these circumstances judicious pruning would so limit the number of spurs that there would be food and moisture for all; and the branches would be so thinned that enough sunlight would filter through the outer and upper part of the tree to keep the remaining parts growing vigorously.

Though possibly a smaller percentage of fruit growers under-prune than over-prune, too little pruning is without question the direct cause of small crops and inferior fruit in many orchards. It is not necessary to visit a large number of orchards in order to find evidence of too light pruning. Dead and dying fruit spurs are very common, especially on older trees. There may be loss of fruit spurs from dense shading in over-pruned trees, and there will, of course, be a certain loss from other perfectly legitimate causes such as occasional injuries incident to picking in very well-cared-for trees, but in general the dying out of many fruit spurs indicates too little pruning.

The practical question at once arises: "How much are we to prune?" From the very nature of the question no answer can be given which can be taken as a rule to be always followed. It is the principles which underlie tree growth and fruit production that determine amount of pruning. Only as these principles are applied to each individual problem as it arises—in other words, to each individual tree—can the right amount of pruning be done. From what has been said it is evident that proper pruning consists in the removal of just enough wood to afford the largest possible number of fruit spurs a good supply of light and food, and consequently keep them growing vigorously and fruiting regularly. A tendency on the part of the tree to produce water sprouts and other wood growth at the expense of fruit spurs indicates that two heavy pruning has already been done. Irregular bearing and dving out of fruit spurs indicates that too little pruning or pruning in the wrong part of the tree, or both, have been faults of recent years. The person who prunes should glance quickly over the tree, judge quickly and accurately of the balance (or lack of it) that exists between wood and fruit production, between vegetative growth and fruit-bearing surface, and then proceed to restore or maintain this balance. In its last analysis the question of amount of pruning becomes a question of judgment. Rules cannot be given, or if given they are almost worse than useless. They mislead as often, or more often, than they lead aright. Principles governing amount can be more or less thoroughly understood and then applied to individual cases. Principles are always the same.

#### QUERIES and ANSWERS

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.

Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

Can anyone tell me how to grow gardenias? Mine have all cast their buds. I grow them in the palm house and feed well each week with nitrate of soda, alternating with liquid cow manure.—T. M. B.

The cause of your gardenias losing their buds is no doubt due to bad drainage. A palm house is also not a suitable place to grow these plants, but a rose house is ideal. You do not state whether you grow in pots, but pot or bench grown, perfect drainage is required and essential. From the daily syringing of the palms the gardenias probably get too much water. Worms also infest some soils very much. Try a watering with Vermine, after readjusting the drainage and remove into a sunny house at once. Syringe daily and repot when necessary, using a peaty soil. Do not feed with nitrate of soda. It will fetch the foliage off and kill the plants. A little top dressing of good loam and cow manure and a little bone dust is better; and an occasional watering with soot water.-R. W. F.

What can I grow in my palm house during summer, when we take the palms out on the lawns? It is 25 feet long and about 15 feet high and has two side benches.-T. M. B.

Celosia Castle Gould, which should be sown at once, schizanthus, and a few ferns also. But do not shade the former. Bouvardia Humboldtii and the double varieties are easily grown, and are nice for using in summer where indoor flowers other than roses are grown.-I. H. T.

Can I grow orchids so as to have a few in bloom each month of the year in a small house 20 by 12 feet, in which I can only maintain a temperature of 55 in winter?-C. A. L.

Orchids can be easily grown in a house such as C. A. L. describes. In Cattleyas, Percivaliana blooms in January and February, Schroederae in March, Mossiae in April and May, Dowiana and gigas June to August, labiata September to Christmas, and then Trianae follows. Also Oncidium varicosum, Laelia anceps, Miltonia Vexilaria, Dendrobium nobile, formusum, and many others which any good orchid dealer can advise on and supply.—M.

#### The Service Bureau National Association of Gardeners

Is maintained for the purpose of providing opportunities for efficient and ambitious men engaged in the profession of gardening. This department of the Association is at the disposal of those who may require the services of capable superintendents, gardeners or assistant gardeners. Address

M. C. EBEL, Sec'y,

National Association of Gardeners,

GLADIOLUS BULBS

"Buy direct from the Introducers." Our special Illustrated List of 1914 Novelties and Standard Sorts describes Hyde Park (an early Shakespeare); Sunbeam (new Primulinus type); Schwaben (the Giant Yellow); Chicago White (very early), Iris (the only lavender), and our noted introductions, Princeps, Margaret, Mrs. Francis King and Jessie. The bulbe harvested on our Michigan farms are plump and healthy. VAUGHAN'S SEED STORE, 31-33 W. Randolph St., Chicago, and 43 Barclay St., New York. Call on us. 

### Plants and Trees From Florida

For Southern planting outdoors and for house decorations in the North

E have made a special study of this matter for 30 years and have achieved a success in growing beautiful plants and in delivering them in like beautiful condition to the most distant purchasers.

It takes special care and preparation to properly pack delicate palms, ferns, etc., to stand a trip of thousands of miles, but we do it—not just once in a while, but a good many times every workday. We issue a large catalog covering all our stock, having 17 special Departments, and send it free.

WE HAVE THE STOCK in immense variety, from all over the tropics, and are constantly adding to our variety.

Chrysanthemum Society of America. Charles W. Johnson, secretary, Morgan Park, Ill.

#### LOCAL SOCIETIES

Bernardsville Horticultural Society. W. G. Carter, secretary, Bernardsville, N. J. Meets first Thursday every month, Horticultural Hall, Bernardsville, N. J.

Boston Gardeners' and Florists' Club. William N. Craig, secretary, Brookline, Mass.

Meets third Tuesday every month, Horti-cultural Hall, Boston, Mass., 8 p. m.

Connecticut Horticultural Society. Alfred Dixon, secretary, Wethersfield, Conn. Meets second and fourth Fridays every month, County Building, Hartford, Conn., 8 p. m.

Dutchess County Horticultural Society. Herbert G. Cottan, secretary, Wappinger Falls.

Meets at Poughkeepsie, N. Y., second Wednesday every month except May and June.

Elberon Horticultural Society. George Masson, secretary, Oakhurst, N. J. Meets first Monday every month, Fire Hall, Elberon, N. J., 8 p. m.

Florists' and Gardeners' Club of Holyoke and Northampton, Mass.

James Whiting, secretary, Amherst, Mass. Meets second Tuesday every month.

The Garden Club of Michigan. Mrs. Edward H. Parker, secretary, 139 Seyburn avenue, Detroit, Mich.

The corresponding secretary will notify members of date and place of meetings.

Gardeners' and Florists' Club of Baltimore. N. F. Flittin, secretary, Paterson Park. Baltimore, Md.

Meets second and fourth Monday every month, Florist Exchange Hall.

The Horticultural Society of New York. Geo. V. Nash, secretary, Bronx Park, New York City.

Meets monthly, irregular, May to October, New York Botanical Garden, Bronx Park, New York. November to April, American Museum of Natural History, 77th street and Columbus avenue, New York.

Lake Geneva Gardeners' and Foremen's Association

W. H. Griffits, secretary, Lake Geneva, Wis. Meets first and third Saturday every month, October to April; first Saturday every month, May to September, Horticultural Hall

Lenox Horticultural Society. G. H. Instone, secretary, Lenox, Mass. Meets first Saturday every month.

Los Angeles County Horticultural Society. Henry W. Kruckeberg, secretary. Meets first Tuesday every month.

Massachusetts Horticultural Society. William P. Rich, secretary, 300 Massachusetts avenue, Boston, Mass.

Monmouth County Horticultural Society. Harry Kettle, secretary, Fairhaven, N. J. Meets fourth Friday every month, Mon-mouth Boat Club, Red Bank, N. J.

Montreal Gardeners' and Florists' Club. W. H. Horobin, secretary, 283 Marquette street.

Meets first Monday every month, Montreal Florists Exchange.

Morris County Florists' and Gardeners' Society.

Edward J. Reagan, secretary, Morristown, N. J.

Meets at Madison, N. J., second Wednesday every month, except July and August,

Nassau County Horticultural Society. Ernest Westlake, secretary, Glen Cove, N. Y.
Meets second Wednesday every month,
Pembroke Hall, Glen Cove, N. Y., 6 p. m.

New Bedford Horticultural Society. Jeremiah M. Taber, secretary. Meets first Monday every month.

New Jersey Floricultural Society.
Geo. W. Strange, secretary, 216 Main street.
Orange, N. J.
Meets first Monday every month, Jr. O.
W. A. M. Hall, Orange, N. J., 8 p. m.

New London Horticultural Society. John Humphrey, secretary, New London, Conn.

Meets second Thursday every month, 38 Main street, New London, Conn.

#### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

The members of the Westchester and Fairfield Horticultural Society turned out in large numbers to attend the regular monthly meeting of the society, held in their rooms in Doran's Hall, Greenwich Conn., Friday evening, May 8 President

### A Bright New Book of 182 Pages for 1914

Telling the Plain Truth about BURPEE-QUALITY SEEDS, is mailed Free of Cost to Gardeners everywhere upon Application to W. ATLEE BURPEE & CO., Burpee Buildings, Philadelphia

Robert Williamson presiding. Considerable James Stuart was also awarded a C. C. for business of importance was transacted, a splendid pair of Calceolaria plants, as was Five new members were elected and one proposition for membership was received. Both Summer and Fall Show Committees made favorable reports. Letters were read from business houses and other friends of the society offering prizes for the premium lists of both exhibitions.

A letter from the secretary of the National Association of Gardeners of America was read, informing the members of the society of the proceedings of the meeting recently held by the Executive Committee of the N. A. G. outlining the policies of the contemplated movement regarding the cooperation of the local societies with the N. A. G. The co-operative movement is now taking more comprehensive shape, and, owing to lack of time, it was deemed wise available to give the matter the serious consideration that such a momentous question deserves

President Williamson then introduced the speaker for the evening, Mr. John K. M. L. Farquhar, of Boston, Mass., who came prepared to deliver his lecture on "Gardens." Before the lecture Mr. Farquhar gave a very interesting talk on the advancement of horticulture in America, giving some interesting statistics regarding importations of horticultural stock, etc. He also called the attention of those present to the scarcity of really good men who are qualified to fill the important positions that this very advancement in horticulture in America has created, and the speaker expressed the hope that the profession of gardening would be. and continue to be, on the level of other professions and callings requiring deep thought and executive ability, inasmuch as the expenditure of large sums of money by the owners of private estates was for pleasure, and not of necessity. There is every reason why the gardeners should endeavor to make these estates a source of enjoyment, and not a care, which is very often the case. We think that when the gardeners are willing and able to give their employers the results that they have a right to expect, there will be a great deal less talk about their employers being "cheap skates."

The lecture by Mr. Farqubar, illustrated by colored views projected on a screen, was very interesting indeed, and dealt largely with "Italian gardens" of different periods, so that today the European ideas with the American modifications and the addition of more flowering plants in the scheme, give results greatly to be desired. The lecturer is eminently qualified to give such a lecture, as he is an expert with the camera, and has visited personally many times the scenes depicted

A rising vote of thanks was tendered the speaker, whom we shall always be pleased to have with us.

A large and very fine display was on the exhibition tables, a feature of which was the magnificent display of sweet pers of the Spencer type, shown by Adam and Thomas Ryan. We doubt whether finer flowers or longer or heavier stems could be found anywhere. Both exhibitors were awarded a well merited cultural certificate.

Wm. Graham for a magnificent vase of Mrs. Russell roses. The judges also made the following awards to the other exhibitors: A. Kirkpatrick, Cattleya Schroderae, highly commended; Wm. Graham, highly commended for vase of Antirrhinum; the same to John Conroy for a fine vase of assorted colors of Antirrhinum, and a vote of thanks to the following:

A. Whitelaw, for a collection of Tulips; Jas. Linane, for Calceolarias and Gloxinias; W. H. Watermoueki, vase of Carnations "Brooklyn"; P. W. Popp, for Laelia purpurata; Thos. Ryan, for vase of Gladiolus; Mr. McAllister, for Trilliums and hardy shrubs; Paul Dwenger, for cut blooms night

blooming Cereus.

A feature of the next meeting, to be held to lay the matter on the table for the next June 12, will be the competition of the meeting, when there would be more time gardeners' assistants for center pieces, composed of outdoor flowers and foliage. Michell silver and bronze medals will be awarded to the winners of first and second honors. An interesting display is anticipated. Don't forget the dates of the Summer Show, June 19 and 20, at Portchester, N. Y. An attractive schedule will be issued shortly. P. W. POPP.

#### NEW BEDFORD HORTICULTURAL SOCIETY.

The regular monthly meeting of the New Bedford Horticultural Society was held in Library Hall Monday evening, April 6, President Roy presiding. An unusually large number was present, the amateur portion of the society being well represented. B. Hammond Tracy, of Wenham, was the drawing eard, and his description of varieties, and word pictures of the possibilities

decorations or hall exhibitions created a lively interest in this wonderfully useful flower, which no doubt will increase the exhibit of this flower at our fall show. lively discussion followed concerning the relative value of stable manure and the various commercial fertilizers in the culture of gladiolii. W. F. TURNER.

#### NEW JERSEY FLORICULTURAL SOCIETY.

The regular monthly meeting of the New Jersey Floricultural Society was held on Monday evening, May 4, 1914, in the Jr. O. U. A. M. Hall, Main and Park streets. Orange, N. J. President Edwin Thomas in the chair and eighteen members present.

The society decided to hold a rose night on Monday, June 1, and an exhibition of sweet peas on Monday, June 6.

Schedules are being drawn up for the ninth annual dahlia, gladiolus and vegetable show, to be held October 5, 1914. Schedules may be had from the secretary on application any time after June 1, 1914. GEO, W. STRANGE.

#### CONNECTICUT HORTICULTURAL SOCIETY.

The regular meeting of the society was held in the County Building, Hartford, on the evening of May 8, with President John F. Huss in the chair. The pansy was on our programme for this meeting, and John C. Willard, of Wethersfield, one of our amateur members, exhibited about 200 blossoms from some twenty varieties. Mr. Louis Chauvy also exhibited a similar number of blooms and varieties. Our president made an excellent exhibit of hardy shrubs: Magnolia Stellata, Magnolia Conspiqua, Forsthia Viridisima, Derca Palustris, Amelan chia, Arabis Albida, Arabis Alpina Compacta, Arabis Rosea, Arabis Alpina flora plena, Primula Cashmeriana; also Viola Cornuta Papileo, Viola Cornuta Gracilis, Viola Cornuta Alba, and Viola Cornuta Lutea. One exhibit of pansies was artistically arranged on white blotters, and the other on yellow paper, the combination having a charming effect. John Gerard, an old pansy expert; Niel Nelson and George B. Baker were appointed by the chair to judge the exhibits, and each exhibit was awarded a first-class certificate. Mr. Chauvy also displayed a plate of very fine mushrooms. President Huss gave an instructive and interesting talk on his exhibit of shrubs and pansies, followed by Mr. Gerard, who dilated on the beauty of the pansy and elucidated on the art of judging this marvelously colored gem of flowers. The secretary read an article in the GARDENERS' CHRONICLE OF America, entitled: "Recent Progress in Hardy Garden Roses, by Arthur Herring-ton." The meeting was well attended and thoroughly enjoyed by all. The annual Dahlia Show will be held on September 23 and 24, this year, a little later than usual: but we hope to make it the best ever.

ALFRED DIXON, Secretary. Wethersfield, Conn., May 11, 1914.

#### ELBERON (N. J.) HORTICULTURAL SOCIETY.

The Elberon Horticultural Society held its regular monthly meeting on May 4. There was a large attendance, and two new

of the gladiolii for garden effects, home plate was awarded to Charles Hurn for an excellent vase of Radiance Roses. Also a cultural certificate to George Masson for a beautiful vase of Anthrammum Buxton's At the next regular meeting on some rink. 1, William A. Sperling, of the him of Stumpp & Walter Company, has promised to give an address on Tulips. The schedule of the Fall snow to be held in Ashmy Park, November 5-45, can be had on application to the secretary.

WILLIAM BRYAN.

#### THE HORTICULTURAL SOCIETY OF NEW YORK.

The monthly meeting of this society was held in the Museum building of the New York Botameal Garden, Bronx Park, m co. operation with the Garden, on May 9 and 10. The exhibition was a small one, there being ten classes, eight of which were for cut flowers, and two for plants; the latter for non-commercial growers, and called for six pots of Pelargoniums and six pots of Calceolarias. In each one the only exhibitor was James Stuart, gardener to Mrs. F. A. Constable, Mamaroneck, N. Y., who was awarded first prize in each case. His Calceolarias were exceedingly handsome, being quite 2 feet in diameter, and models of skillful cultivation. The same must be said regarding the regal and fancy Pelargoniums; these two exhibits formed a central attraction of the show.

Joseph A. Manda was the only exhibitor of orchids; and William Tricker, of Arlington, N. J., staged a vase of hybrid Nymphæ as of the Mrs. Woodrow Wilson per-

petual flowering type.

James Stuart also had an exhibit of a new Viola, which is thought highly of for summer blooming. A non-competitive exhibit of Sweet Peas of very great merit came from Miss E. V. Cockroft (gardener, Adam Patterson), Saugatuck, Conn. There were also a few exhibits from private sources comprising spring flowering ornamental shrubs and a very notable collection of alpine plants from a private garden at Tuxedo.

#### THE AMERICAN PEONY SHOW.

Representatives of the American Peony Society, Horticultural Society, of Chicago, and the Chicago Florists' Club, held a meeting at the Hotel Sherman, Chicago, May 14, to complete arrangements for the great annual exhibition of the American Peony Society, which will be held in Chicago this year under the auspices of the above or ganizations. Those in attendance included: William A. Peterson, of the Peterson Nursery; Carl Cropp, of Vaughan's Seed Store; Arnold Ringier, of the W. W. Barn ard Company; Thomas Wallis and M. Barker. The Art Institute was selected for the exhibition, which will be held June 12 13, this date being subject to change as weather conditions affect the local crop of peony flowers, making it earlier or later. Many experts will show their choicest novelties and standard sorts in their best form at the coming exhibition, which from all advance information obtainable will be the largest and most complete of its kind ever held in this or any other country. most successful growers of peonies will tell about their methods in meetings to be held in connection with the exhibition.

C. W. Johnson, 2226 Fairfax avenue, Morgan Park, Ill., was appointed manager members were elected. A cultural certifi of the exhibition, and all inquiries referring

#### TUXEDO HORTICULTURAL SOCIETY.

The usual monthly meeting of the Tuxedo Horticultural Society was held in the Parish House on May 13, President David Mc-Intosh in the chair. The Executive Committee reported the schedule for the Fall Show in progress, and that special prizes had been offered from the following firms: Messrs, C. H. Totty, Bon Arbor Chemical Co., Scott Brothers, Wm. F. McCord & Co., Weeber & Don. Burnett Brothers, Alphano Humus Co., A. N. Pierson, Inc., J. M. Thorburn Co., John Wilk, Julius Roehrs Co., and Henry Dreer. We expect to have the preliminary schedule out by the middle of We had as our guest Mr. Wm. Tricker, Arlington, N. J., who entertained us to a very interesting talk on the culture of water lilies. Two new members were elected to membership, Mr. Wm, Muir and Henry Gibson.

The society held its ladies' evening on April 16, when there were present over one hundred gardeners and their wives and friends. They had a very nice entertainment. Al. Baker, ventriloquist, Thomas Dobson, humorist, and George Leonard, Dobson, humorist, and George Leonard, pianist, from New York, kept the company well entertained with their funny stories. S. H. Chaplin sang a solo which was well received. The society's annual ball will be held in Tuxedo Town Hall on Wednesday, THOS, WILSON, May 27.

Secretary.

### Standard Cyclopedia of Horticulture

THE new Standard Cyclopedia of Horticulture has been freshly written in the light of the most recent research and experience. It is not merely an ordinary revision or corrected edition of the old Cyclopedia, but it is a new work from start to finish with enlarged boundaries geographically and practic-

ally; it supersedes and displaces all previous editions or reprints of every kind whatsoever.

It is the fullest, the newest, the most authoritative of all works of its kind and constitutes the most conscientious attempt that has ever been made to compress the whole story of our horticultural thought, learning and achievement into one set of books. The owner of the Standard Cyclopedia of Horticulture will have at hand in this work a means of quickly satisfying his need for authoritative information. It is both an Encyclopedia and a Manual, for with the aid of its Synopsis and Key, amateur and professional alike may quickly identify any plant, shrub or fruit contained within the set, and then receive expert instructions for its cultivation.

### MRS. FRENCH VANDERBILT'S HOUSES AT NEWPORT

IN 1911 we crected the house directly opposite the work-room entrance. Last Spring the wing house at the right was added, making an L-shaped layout as attractive as it is practical. The gardener, Daniel Hay, says that the wall yent give ample ventilation for his purposes.

There are some gardeners, however, who want

direct side ventilation but hesitate in demanding it because it detracts from the look of a curved eave house. If you are such a one, forget it, as we have solved the side ventilation problem most satisfactorily.

If you are thinking of building, it's a thing you ought to know. We will include with the answer

to your letter, one of our catalogs.

# Gardeners All Over the World Use

APHINE, for spraying against all sap-sucking insects, such as aphis, red spider, thrips, mealy bug and soft scale; and for cleansing palms and decorative stock generally.

NIKOTIANA, for fumigating, a nicotine solution which does not fill the house with smoke as does tobacco paper or dust. It is vaporized in pans over small lamps, or by painting the steam pipes.

FUNGINE, to control mildew, rust or bench rot in the greenhouse, a spraying material; an infallible remedy. It does not stain foliage as Bordeaux or lime and sulphur, but cleanses it.

VERMINE, to rid the greenhouse soil of eel worm, root maggots and other soil vermin, will be found most effective. Used according to directions it is not injurious to vegetation.

# For Out Door Spraying of Trees, Shrubs and Hardy Plants

SCALINE, an oil and sulphur composition—three in one—an insecticide, fungicide and scalicide combined, destroys San Jose, Oyster Shell and other scale, red spider, larva of the aphis and locust borer. Now is the time to spray to protect your trees and shrubs against the ravages of the various insect pests.

#### **GREENHOUSES** U-BAR

PIERSON U-BAR CO

ONE MADISON AVE. NEW YORK CANADIAN OFFICE TO PHILLIPS PLACE MONTREAL

Here's a grass test. Alphano Humus was spread on the terraced part, and the customary barnvard manure on the rest. The Alphano being in powdered form, was taked in. The manure being it will trained and tall of litter, eventually und to be taked off, earlying along much of its worth. There days before this photograph was refund, all the grass was cut. The rest marked contrast in the height and evident depth of color of the grass between the two portions, tells its own story of the real worth of Alphano Humus.

# Reasons for Our Slow Deliveries on Early Spring Orders of ALPHANO HUMUS A Frank Statement

Lit us tell you exactly what the uncontrollable conditions were, under which we have been laboring; and then we will leave it entirely to your sense of fairness if we haven't done all possible, under the circumstances.

For ten years our salesmen, personally, have been selling large quantities of this Alphano, but last season was practically our first direct advertising of it. The way the responses came and orders followed, it was abundantly evident that we had a Plant Food and Soil Builder that was welcomed and

We sold bags, tons, carloads, and barge loads of it, as never before. Last Winter we figured that this season, a large number of these satisfied customers would come back for 1,5 ore, and that also many of their friends learning of the results secured by using Alphano on lawns, shrubs, trees, and gardening in general, would likewise become customers; so based on this we spent many thousands of dollars increasing our facilities so that deliveries could be made promptly.

As sanguine as we were we frankly admit having under-estimated the amount of the orders that developed.

To add to our embarrassment, the late snows and cold weather made people think Spring was never coming, and so they put off ordering three to four weeks later than usual. Then when the first warm days did come, in came the rush orders. As a result we but naturally became way behind on shipments. In the face of all this we received

In the face of all this we received some pretty stiff letters and rather dynamic phone calls demanding explanations.

To show our absolute good faith, we voluntarily returned a good many

what we were struggling against, felt we were negligent. Today, June 1st, our reports show that we have caught up on deliveries and although the plant is working full tilt, and overtime, our shipments from now will be prompt.

Those of you who wanted the Alphano for gardening, and it came too late to spade directly in the soil, will find it works wonders when dug around the plants after they are up two or three inches.

As for shrubs, now is as good a time as any to use it. When it comes to lawns, any time is a good time. Put it on now and it will prevent the soil from baking, and the grass from burning this Summer. It will induce a strong growth of fine, fibrous, dry weather-resisting roots. The Alphano absorbing and holding as it does such large quantities of moisture, further fortifies the grass against the coming hot sun and the drying winds. Being in powdered form the Alphano is easy to apply. Being odorless it's at all times free from objection. To apply now, cut the grass, spread on the Alphano, rake it in, and in two weeks' time you will be surprised at the results.

Our records show that during each month of June, July, August and September of last year, we sold more Alphano Humus for lawns than during any one of the Spring months. Let us know about how large your lawn is and we will advise how much you better order.

If you have your Alphano, use it at once. If you haven't any left for your lawns, shrubs, and garden

order some.

If you have never had any, and are interested, but still unconvinced of its merits, send for our book of CONVINCEMENT. It tells what it will do for you, by telling and showing what it has done for others.

\$12 a ten in bags -- \$8 by the carload in bulk. F. O. B. Alphano, N. J.

# Building the Flower Garden

By W. G. Gomersall.

There is no garden picture so beautiful as that produced by a group or groups of hardy flowers and foliage. Yet try as one will to produce the best effects how often we have to admit that some of the most beautiful and effective flower pictures we have seen have been produced either by accident or without human careful forethought. Yet, because occasionally one has met with this accidental picttire, it does not follow that unskillful or careless planting will produce such results, far from it. To properly plant pictures of tree shrubbery or hardy flowering plants requires a knowledge of their habits, their flowering season, height, degree of hardiness, whether fall or spring is the best season to plant. Whether they are shade or sun loving plants, whether suitable for a dry or wet ground, and also it is important to know their suitability as a cut flower, and their color. Some plants are best adapted for a semiwild garden, others for edges of lakes and water courses and others form splendid subjects for the well kept lawn. It is among the rocky hills bordering the Hudson River that some of the most glorious Autumn pictures are seen to the best advantage.

The Wild Aster or Michaelmas daisies in lovely masses of lavender, lilac and purple splendor splashed with Golden Rod and the fiery Autumn tints of the Sumach toned and mellowed by the yellow leaves of the Sassafras and the rich red coloring of the dogwood. A bold rock standing majestically above this group has tempted a woodbine to raise its head above the purple mass and itself has put on that glorious orange scarlet tint with which the sun has clothed it and so make it a fit companion for such gorgeously arrayed company. What more beautiful picture could there be for the eyes to feast upon. But imagine the flowers changed to hollyhocks, Campanulas or gorgeous Phlox, and would not the picture lose its charm, or if the whole picture were transferred to a well kept lawn should we not realize the discord of the surroundings. The inharmonious settings to the picture would rob it of its charm.

In planting hardy herbaceous plants the adaptability of the surroundings to the character of the plants must be considered, where a corner of the grounds can be spared. Try a special setting for those hardy flowers that are of a semi-wild character. It may take a few years to grow the surroundings into that peaceful and restful character so that everything growing appears so adapted to its surroundings, that the hand of man is lost and only nature seems to have done the work.

In the formation of such a hardy garden, rocks are of great assistance. In many localities, however, rocks are not obtainable, but the evenness of the ground may be broken by sunken gardens using the excavated earth to

form mounds and slopes, the whole or part being screened from the general view with evergreens, Rhododendrons, Pines, Spruce, Boxwood, etc., or plants of such character as are adapted to the local climate conditions. These sunken or depressed gardens would in wind exposed places form splendid gardens for such tender plants as are difficult to grow exposed to the winter wind. The possibilities of such a garden, if entirely surrounded by Pines, dense growing deciduous shrubs and evergreens adapted to the locality, appeal to the imagination. Being separated and distinct from the other gardens, it would have a distinct character of its own. The entrance might be partially obscured and thus be a garden for seclusion and rest. In such a place would be found a home for choice Rhododendrons, Andromedas, Azaleas, Clethras Kalmias and Hollies, Osmanthus and even the laurels and Aucubas. While intermingled or in groups would be planted Cornus Florida, the white and red flowering, Pinus Mugho and Prinos Verticillata or deciduous holly and Euroymons Europeous, while on the top of the mound Rhus Glabra Laciniata or cut leaved Sumach. and Eunoymons Alatus and a cer ginnale against the background of Pines would be most beautiful, and here would grow in perfect harmony the Wild Asters Novol Anglica, and the Heleniums, Autumnale, Superbum and Pumilum. While on the sloping bank a mass of Hypericum Moserianum, Densiflora and Aenothera Youngii with Mahonia Aquafolia would be charming. Of course, the continuity of such a sloping bank would have to be broken, by either rocks or planting the Rhododendrons to form The rocks could be covered with points or breaks. Wichuriana Roses, Cotineaster Microphilea, English Ivies, Polygonium, Baldsehusanum and Clematis, and a few plants of Veronica Subsessilis and Salvia Azurea thrown in near the Hypericums would, with their lovely blue harmonize with the yellow of the Hypericum. The border being on a slope could be wide in places and narrow in others, having an edging of English Ivies or Vinca Minor, and perhaps in places Phlox Subulata, Funkia Subcordata Grandiflora and the Tritomas. Here too would be splendid places for groups of Liliums and Incarvillas. The Alstromeria Chilensis flowering at the same time, as the Speciosum Liliums, would with their orange and pink flowers, harmonize splendidly with the pink and white of the Liliums; flowering in the Autumn too, would be most useful for a summer residential garden.

Some of the Eremurus with their white and pink flower spikes from 4 to 8 feet high are splendid for the center or back ground of a Lily group, and the Autumn Daffodil, Sternbergia Lutea with the Autumn crocus, Colching would find a home, bother grouped in a task

A to t

nestled up to a Mugho Pine or a group of Yucca Filamentosa.

Such a sunken garden as this, where irregularity, with harmonious arrangement of color and form in foliage, is tastefully carried out, would produce that charm of peaceful, restful character that is so much admired in our best

natural landscape scenery.

The sunken garden is both useful and beautiful also when used for more formal garden effects. It is particularly adapted for a garden of Tea and Hybrid Tea roses surrounded by climbing roses growing on chains festooned from posts, beneath which, and surrounding the sunken garden, would be a border of roses consisting of types like the Hybrid Sweet Briers, the Rugosa Roses, Austrian yellow brier roses and its Hybrids, and moss roses. In shape it somewhat resembles the character of

an Italian Garden. By that I mean angular, not curved. A border may be planted with all the varieties of flowers known, yet have little or no artistic beauty. A bed of hardy flowers may be interesting and yet not be beautiful. I recently saw growing naturally a mass of Lobelia Cardinalis. It was in a low moist open sunny situation, intermingled with the flowers of Red Top grass (Agrostis Vulgaris) and others. The picture was so strikingly beautiful that it could not fail to attract attention. In our gardens we may not have, or want, the same conditions, but we may make a picture with this plant that would be at least attractive. On a border or a bed we mass this Lobelia with another, Lobelia Syphilitica, having blue flowers, planting among them the hardy grass Elymus Glaucus, edged with a low grass Festuca Glauca or the bed could be edged with a small yellow Chrysanthemum or Aenotheva Fraseri and Youngii, still another combination with this cardinal flower would produce a most beautiful effect. Lobelia Cardinals intermingled with Platycoden Grandiflorum, blue and white, edged with the blue Campanula Carpatica or Persifolia, Salvia Azurea would be charming, planted with the Lobelia Cardinals. A little sweet Alyssum seed sown on the bare spaces would add to the beauty of the bed, and some Montbretias, Tritomas or Gladiolas would prolong the season till frost.

A bed of Veronica Subsessilis and hardy Delphinums, intermingled with annual Larkspur and the annual Giant yellow Poppy, Hummemannia Fumariacefolia would

make a striking and yet harmonious bed.

The Funkia Subcordata Grandiflora intermingled with Tritoma Pfitzeri would form an attractive group. old Feverfew or Matricaria would with a scarlet Phlox like Coquelcot make a beautiful bed, lasting from June to October. The double white Yarrow Achille, "The Pearl," might be used instead of the Feverfew and an edging of Linum Perenne or Coccinum would improve the bed. Anemone Japonica in all its varieties are most beautiful in masses, and their beauty is enhanced if edged with the hardy violet Aster, Acris Nanus. Masses of Anemone Japonica are beautiful on the wavey border line of a shrubbery, a few groups of Helianthus Soliel de Or, Miss Mellish, Hoopsii Pimilum and the double form of Heliopsis, form a splendid background of color for the white and pink Anemonies.

A bed or group of hardy Chrysanthemums, yellow and white will be more beautiful if edged with Sedum Spectablis and a group of Aster Novae Anglica with its purple flowers will be more admired if planted with groups of Heleiums and a mass of Hemerocallis (day lily), Thumbergii, Flava and fulva in the foreground. A bed or group of Hydrangea Paniculata Grandiflora may be carpeted with Anthemus Tinctora Kelwayii or edged with Coreopsis Lanceolate or have for a background, Golden Glow, Heliopsis Pitcheriana or some of the varieties of Helianthus. They also combine well with the Buddleya

Veithcii, flowering at the same time.

The Mahonia Acquafolia with its red bronze foliage makes a splendid front edge to a mass of Helenium or Hardy Yellow Chrysanthemum or to a bed of Titomas and Montbretias.

A pretty bed or group would be formed with a combination of Penstemon Barbatus Torreyii and Oenothera Fraseri and Youngii. The Monardya Didyma groups well with Physostegia Virginica Alba, but is likely to overgrow anything planted with it. It is a charming and striking plant for a border and is beautiful planted in front of a group of golden foliaged plants like yellow

Elders, Golden Privet or Syringea.

A bed or group of Montbretias and Tritomas needs a blue to bring out their rich coloring. In the background or to one side a group of Caryopteris Masticanthus, Buddleya Veitchii, and Buddleya V. Magnifca, while planted over the ground may be a few Veronica Subessilis and Stokesia Cvanus. A little tall annual Larkspur would be effective sown for a background and some dwf. blue Larkspur could be sown among the Montbretias. The annual nemesis, blue gem, should make a splendid plant to intermingle with Montbretias.

A mass of Rehmannia Angulata with its Foxglove like pink flowers growing 4 to 5 feet, makes a beautiful picture on a border, these are splendid plants to arrange in harmony with groups of Hollyhocks and the various varieties of Foxglove, all are stately flowers and must not be smothered up with shrubs or overhung by low branches, let them stand out prominent at the bend of a shrubbery border or centre of a bed, where their upright flower stems appear to challenge their more majestic com-

panions the Oaks, Beech and Birch.

A corner or background best suits the Boltonia Asteroides, a few scarlet Phlox or Red Gladiolus mingling their heads with the showers of white daisy, mist like flowers of the Boltonia, forms a pretty picture. The Boltonia Latisquanna forms a splendid picture combined with the large flowering Hybiscus or Mallow of which there are now so many beautiful colors. For border effects in the Autumn they are most charming.

Heuchera Sanguinea and Veronica Subsessilis will make a pretty edging to a bed of Canna Buttercup, carpeted with Tagettees or Sweet Allysum; the Anchusa Italica Dropmore variety can be intermingled with a good vellow or orange Canna. Pentstemmon Barbatus Torreii forms a good combination with white Snapdragons or with Physostegia Virginica Alba, and a border planted with Shasta Daisy or any white free blooming daisy, and the pink Petunia Rosymoon, with a background of Chrysanthemum Uligolosum with a few Montbretias scattered through forms a picture not soon forgotten.

Some times a very pretty feature may be made of a sundial or a large vase, by preparing a bed at its base and planting the whole with May blooming Tulips in all their varieties. Also with Spanish and English Iris and Montbretias, Hyacinth Candicans, Tygridias, Alstromerias and Liliums, then plant the bed thick with English Ivy, edge the bed with Phlox Subulata roses or Eunoymons Radicans Varigata and an all season, permanent and pretty bed is obtained at a small cost. Phlox Subulata and Alyssum Saxatile forms a pretty edging to a quiet walk, especially when a few rocks are used to line the walks edge.

The Aquilegia or Columbines are among the most beautiful of spring flowers; they are best grown in a mass; they do well in partial shade grouped under trees, or at the edge of woods and shrubberies, they are a charming feature. The Dielytras and Corydalis and the lovely Doronicums or Leopards bane all enjoy shady

places, as do also the Tree and Herbaceous Peonies and the Hypesicums, but they also lend themselves to the adornment of the open borders. Although as with the Wild Asters and the Golden Rod, their place is in a part of the garden that is set apart for a quiet corner, a sort of semi-wild garden where the mowing machine is not allowed to enter, and the pruning knife is sparingly used.

Surely, in such a place as this, a Lily-of-the-Valley bed would be found, and a bed of Violets, the Poets Narcissus, Wood Hyacinth, and the endless variety of the other Narcissus, Trilliums and Crown Imperials. Here too, if there are a few trees, plant some climbers. Clematis Paniculata will soon scramble into a tree letting fall its long tendril like growths like a fountain of snow. The Akebia has a light feathery growth which does no injury to the trees through which they clamber and festoon from branch to branch.

Celastras Scandens or Bitter Sweet might be far more extensively used in the plantation lines. It is a strong grower but its soft trailing habit does not allow any injury to the trees, and its persistent red berries enliven

the shrubbery trees all the winter.

Quite recently I saw an old pear tree with its trunk and branches almost covered by the Euonymons Radican Varigata. It was a beautiful object and undoubtedly produced by chance. If some one planted a Bitter Sweet vine so that it scrambled through the branches intermingling its red berries with the white foliage of the Euonymons, a charming picture would be produced. The Euonymons Radicans is a splendid climber to plant at the foot of trees, for it will clothe the bole of a tree withstanding frosts that would kill the English Ivy. Hydrangeas Scandens is a good tree climber, also good for walls. It is self-clinging, has handsome foliage and pretty clusters of flowers. For large trees the Ampelopsis Virginica surpasses all the climbers, pushing its growths up to the top branches or to the outermost twigs, letting fall its long tapering growths which, during the summer are unnoticed, but in the fall their brilliant coloring and gracefulness makes this vine a prominent and charming feature of the garden.

The Dutchman's Pipe is a good vine for large trees or for furnishing the entrance to a secluded or different part of the garden. Some of the Honeysuckles are also splendid climbers for scrambling into lower limbs of the trees in narrow plantation belts, giving that density which is a necessary feature and yet not obtainable because of

narrowness of the planting.

The Honeysuckles, Ivies, Vincas and Euonymons should be planted extensively for a carpet through the shrubberies and plantations, the little moisture they take is a small matter compared with the protection they give the roots from the drying, hot winds in summer and severe cold of winter. Then the leaves they hold decay and enrich the ground. This manner of treating shrubbery borders opens a field for hardy bulbs, for in such a place they will give the best results. It is on the wavey outline of these shrubbery and plantation borders that our Peonies find a place. If planted in groups of one color they are the most effective. The Iris family also, if there was no more suitable location, would do splendidly here. The Spanish and the English should be planted so as to get the protection of Ivies and other ground creepers. Of course, a place near the water would be preferred by most of the Iris, but the Iris family are accommodating; they do well almost anywhere if given a deeply dug and well prepared soil with protection for their crowns in the winter.

The Spirea family are all beautiful, from the tall Spires Aruncus to the small Japonica in groups near the water or in a moist situation they are most at home. But they,

like the Iris, will accommodate themselves to almost any situation if not very dry. The Spirea Palmata and Queen Alexandra are both very pretty and should be included with the other Spireas.

In arranging the various plants so as to obtain a unity of expression there must be harmony in the individual parts, and each individual part must be in harmony with

the whole.

There is no rule to work by. The landscape artist must have a preconceived picture impressed upon his mind. He may have seen it, and endeavors to imitate or he may have an idea of his own, but the scene, the picture, which he desires to work out is impressed upon his mind, and every act performed in the work is part of the definite plan already in his mind having a definite shape. Of course, diversity of mind, climate and environment must naturally produce different tastes which will show itself in flower arrangements equally with dress and millinery.

In carrying out flower bedding arrangements there are certain principles that should be borne in mind. We may not need reminding, but I will just mention the fact that a flower bed or flower garden is to display the flowers. It is not the purpose of flowers to display the beds.

Beds of flowers in the form of a clock, a rug, or an animal, or the initials of the owner may gratify some individual taste, but it is not art. They may be even quaint, but not beautiful nor artistic. Try to avoid all such eccentricities. One look usually suffices to take in all there is in such objects. It is, of course, essential that the flower display be in harmony with the surroundings and the residence, if near.

Beds of flowers should not be scattered over a lawn without any apparent connection with each other, and yet no hard line can be drawn, for exception is made to beds of cannas, castor oil plants, hardy grasses, bamboos, and sometimes Salvias, or plants of that character, when properly placed. Simple or regular formed beds are usually the best to display flowers and easiest to fill and care for. Such shapes are rectangular, circular and elliptical or oblong. Flower beds show to the best advantage when formed into groups or flower gardens. The patch work quilt style of shrubbery planting bears the stamp of office manufacture; it is not landscape art. Landscape art more nearly approaches an artistic picture, the other, the carpet factory.

The hardy flowers appear most natural on borders with a background of tall plants, of sufficient depth to give an air of density. On such a border both hardy perennials and annuals may intermingle. If planted or sown in irregular groups or masses, the best effect is produced, although I think some latitude is left to the individual taste. Hollyhocks to my taste are beautiful and stately in rows, while the foxglove of similar appearance, but smaller, appears to better advantage in irregular groups. The hardy Asters are best with the golden rod in the semi-wild garden border, so also are many of the tall growers like the Boltonias, some of the Helianthus and Heliopsis. The hardy garden pinks are best used to edge a border or group. They may even be dug every year or two and relaid like box edging. Their foliage is attractive the whole year.

Some plants like the Iris, Hibisens Moschutos or Mallows and Lobelia Cardinalis and some Funkias show off to the best advantage if planted either by the waterside or in wavy lines in hollows or at the bottom of a declivity so as to resemble as much as possible the line of a watercourse.

The rose-garden is always an important feature and indispensable in all gardens of any pretensions. This should, where it is possible, be detached from the main

lawn or garden; not pushed into a corner in the shade, for nooks and corners seldom make good rose gardens, but select a sheltered position open to the sun and air. A few shrubs should be grouped around it to give an air of privacy, for it is here that ladies will delight to bring their friends. Vistas of the glories of the rose beds seen through breaks in the shrubbery should entice them to walk to it while an open and fully exposed to view rose garden that may be seen from a distance, may not tempt a close inspection.

Rustic posts with chains festooned from post to post serve for climbing roses and may also be utilized for clematis. This makes a pretty and neat arrangement for partially enclosing the rose garden. Grass walks are good for a rose garden, and it is a good plan to have a bed for each variety.

To break the monotony of sameness in height of the dwarf roses, standards should be freely planted, while in some rose gardens climbing roses could be used trained to poles. It is not difficult to select a good collection of roses. The tea and the hybrid tea roses, however, should be well represented in any rose garden, for they continue to bloom right into the winter months. The delicate coloring of their flowers make them charming subjects for the summer and autumn rose garden.

That splendid rose "Gruss un Teplitz" is exceedingly useful for bright effects. I have used it for a border alongside of a mountain-stone house, with very good effect. In such a position it is not glaring, but harmonizes with the stone and helps to relieve the dull color. This rose blooms profusely the whole season and its foliage is handsome. I consider Caroline Testout the best pink for bedding. The budded Hybrid tea roses are better than own root plants for outside. They are more vigorous than the "own root plants." I believe they ripen up better in the fall and so are better able to stand the winter. Tender Tea roses may be dug up in the fall and heeled in to a depth that completely covers the plants. In this way no losses occur, or they may be moulded like celery. Tying up with straw is then unnecessary. Standard roses may also be dug up and buried in the late fall. No losses will then occur with the standards as is often the case now.

I have not troubled you with long lists of plants. The nursery catalogues supply these; the cry and need is, how to use them. Progress in horticulture during the last twenty-five years has been marvelous. There is no reason to suppose it will not continue. It is for the gardeners to grasp the situation, study the art of landscape gardening, get well acquainted with trees, shrubs and hardy flowers, study the work of great landscape gardeners and the characteristics of the plants and trees you have under your care. Endeavor to plant more of the things you do not know, even if you have to tear out, or rearrange, your shrubberies, so that your knowledge of trees and shrubs is thorough and up to date.

The man who produces beautiful effects in the arrangement of flowers makes the world more cheerful and his work has a great refining influence upon the people who come in contact with it. But the work itself is ephemeral, changing like fashions, and often produced to suit tastes and moods. But good landscape effects are not influenced by fashions, tastes or moods, but are produced by following certain well defined principles. The carrying out of which calls for the best of good judgment and a thorough and definite knowledge of horticulture gained by practical experience and association with the best in landscape art, until one becomes imbued with that sense of adaptability, harmony, and good taste that is essential to the landscape gardener's art.

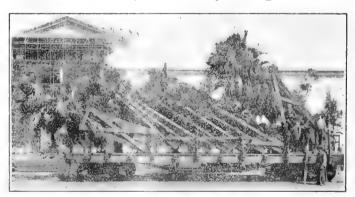

#### TRANSPLANTING BIG TREES.

Hundreds of full grown palm trees are being transplanted to the gardens and courts of the Panama-Pacific International Exposition at San Francisco. The operations in connection with moving the great trees are conducted on a larger scale than any other previous similar work, yet the palms comprise only one portion of the great aggregation of trees and plants and flowers that are being gathered from all over the world for the decoration of the 1915 Exposition.

The horticultural and floral display in magnitude, variety and beauty will excel anything of its nature ever presented at a world's exposition. Thousands of trees, shrubs and flowers have been introduced from far corners of the world. These include hundreds of giant tree ferns, palms, cypress, rhododendrons, firs, acacias, eucalyptus trees, banana plants, orange and lemon trees and thousands of trailing vines and flowers including roses, bougainvilleas, veronicas, hydrangeas, geraniums, tulips, crocuses, anemones and daffodils.

Two species of palm are used on the Exposition grounds; principally to line the South Drive which runs between the main group of exhibit palaces and the great South Gardens. They are the Canary Island date palms and the California fan palm, a carload of the latter being shown in the accompanying photograph.

The trees are brought to the Exposition grounds from

NOVEL SYSTEM OF REPLANTING LARGE PALMS.

nurseries where for the past year or six months they have been prepared for transportation by means of the side-box system, perfected by John McLaren, director of the Exposition landscape work. The side roots and trees to be moved are cut at least six months in advance and the boxing is sunk on four sides. When the tree is acclimated to its "short rations" the roots that extend directly downward are cut and a bottom put on the box. Before being moved, uprights are nailed to the box to prevent damage to the trunk during transportation and the tree can then be lifted bodily aboard a freight car. Trees weighing anywhere from eight to twenty tons have been handled in this manner with complete success. At the exposition grounds the process is reversed. The box containing the tree is set in the ground with the bottom removed and later the sides are drawn out, allowing the tree to gradually become accustomed to the changed condition.

The whole effect that will be obtained through the use of such large quantities of full grown trees will be that of a park of years standing. The gardens will be complete months in advance of the opening of the Exposition on February 20, 1915, and to the visitor there will be little evidence apparent that the space then occupied by the great exhibit palaces and wide stretching lawns, with interspersed clumps of trees and bushes, was but a short time ago a wide expanse of salt water and marsh land.

#### THE SEMI-AQUATIC IRISES.

By H. J. MOORE.

The most noteworthy of the semi-aquatic group of iris is the Japanese I. Laevigata (syn. Kaempferi), differing to such an extent from the other representatives of the genus as to merit the name of the clematis-flowered iris, owing to its flowers resembling those of the large-flowered clematis. This lovely plant will flourish in any good soil, and is not particular to position if such be damp, and sunny, but as it is really semi-aquatic, this iris is seen at its best when growing by the water's edge, near a small stream, for instance. When arranged in masses in such positions the beauty of its flowers is indescribable, the colors are magnificent. Many flowers measure eight inches in diameter. When associated in a scheme with other semi-aquatic or aquatic plants, such as Nelumbiums and water lilies, no combination could be more pleasing.

The Japanese Iris may be effectively used in any sunny border with a soil fairly retentive of moisture, provided that water be copiously afforded during dry weather, especially previous to flowering and for a short time afterword. It is not advisable to attempt to grow the plants in a very sandy or porous soil, but a depression or hollow may be utilized to advantage in a garden with such a soil, by simply incorporating a quantity of clay when planting. In such depressions moisture will remain much longer than on higher ground, and by judicious applications of water, results will prove eminently satisfactory.

A novel and interesting way in which to grow the Japanese Irises is to sink a tub or barrel without a bottom, into a hole in the garden border, or even in any convenient and sunny position. The depth of the barrel should not exceed eighteen inches. Four inches of clay should be placed in the bottom, and upon this twelve inches of good adhesive loam, leaving two inches of space at the top. Plant the iris either during the fall or spring, and during the second spring after planting, just as growth commences, afford weak applications of liquid cow manure occasionally. When buds are forming, and during the flowering period, do not neglect to water nor withhold it entirely until the resting period approaches.

The season of flowering of the Japanese Iris is from the middle of June until August, varying, of course, with latitude. The common yellow Water Flag I. pseudacorus, and its varioties albus and Bastardi, also the native species I. versi-color and I. carolinensis, are all suitable for water-side planting, while the exotic Iris sibirica and its many varieties, so well known to all lovers of the plant, require a moist rich soil and a sunny position for their perfect development. There are also many other semi-aquatic exotics, of which space forbids mention, but which, if cultivated along the lines advised for the Japanese types, will give equally good results in a moist border or at the water's edge.

The Japanese, as indeed almost all semi-aquatic irises, may be raised from seed. Many new varieties are annually raised by crossing. This latter procedure is interesting and worthy of a trial, as the iris offers a wide field for hybridization. Spring, as recommended for the border types, is the best time to sow the seed. Division of the rhizomes, however, is the quickest and most popular method of propagation, this being performed by simply severing them in the manner explained in a recent article.

It would seem that there is need of, and room for, extensive experiments with the hardy iris, especially the semi-aquatic types, exotic or otherwise. It appears incongruous that such beautiful and valuable plants are not included more generally in landscape gardening schemes, especially where woodland and water scenes are included. Many species and hybrids are eminently adapted for natu-

ralizing in such positions, as they seed readily and quickly cover large areas with multi-colored patches of flowers, which are a thousand-fold more desirable because more naturally arranged and more naturally adapted to wild gardening than the mixed exotic, and other herbaceour perennials, and shrubs which are often used for t

In naturalistic planting, where native irises cannot be obtained or where some special effect is desired, it is quite permissible to utilize exotic subjects, but we must remember that irises are irises all the world over, and if the iris is to be a special feature of any scheme, we must not be misled by the lure of some nursery catalogue with its brilliantly-colored plates and glowing descriptions into purchasing something just as good. There are numerous responsible firms from whom the semi-aquatic irises may be obtained, there being nothing just as good as the iris where the iris is the logical subject to use.

Canadian Florist.

#### JUNE.

OINED be the hand of time and June, The fragrant rose, the garden's pride, Opulence of heavenly boon,

Perfumes the air at eventide.

INDAUNTED time at manhood's noon, Comes now to wed his long sought bride. EATH nodding stars, and summer moon Their vows are made, the knot is tied.

Round Earth's altar flowers festoon, Morn wafts their fragrance far and wide,

Birds warble in their sweetest tune,

All nature joins "Here comes the bride," May they enjoy their honeymoon. FRE long, bold fate shall them divide.

DAVID S. MILLER.

#### PERFECT DAYS.

The poet and mystic, Emerson, wrote of the perfect New England day: "There are days which occur in this climate at almost any season of the year, whereon the world reaches its perfection; when the air, the heavenly bodies and the earth make a harmony as if Nature would indulge her offspring;... and the cattle that lie on the ground seem to have great and tranquil thoughts." It was of such a day that Lowell sang:

"And what is so rare as a day in June? Then, if ever, come perfect days: Then Heaven tries earth if it be in tune, And over it softly her warm ear lays."

The busy man in the strenuous days of having has, it is true, little time for poetry and reflection; yet there is something about the quality of the early June days that lifts us out of ourselves, and sets us in tune with the infinite. But these thoughts visit only those who are in close touch with Nature, and are scarcely possible to those who walk in the deep caverns between sky-scrapers. and whose horizon is bounded by rows of houses. Thus by the divine law of compensation, those who in the fields are bearing the heat and burden of the day are able to see with a clearer vision as they lift their eyes to the hills.

The man who is thus daily and hourly in close touch with Nature, sharer of her secrets, partner in her bounty and witness of her beauty and her miracles, ought to be a clean and wholesome man, as we believe usually he is. Wickedness and vice cannot live in such an atmosphere if man is in proper touch with his environment and has caught the celestial fire. Let us all, however busy we may be, pause long enough to drink in the beauty of these June days, and be thankful that our lines have —Farm Journal. fallen in pleasant places,

#### GEORGIAN COURT, LAKEWOOD, N. J.

A recent visit to "Georgian Court," Lakewood, N. J., the country estate of George J. Gould, Esq., found it almost perfect in springtime splendor. The fine collection of rhododendrons, both the catawbiense and hybrids, as the accompanying illustrations show, were rich in flower.

The azaleas Amoena (there must be over a thousand of

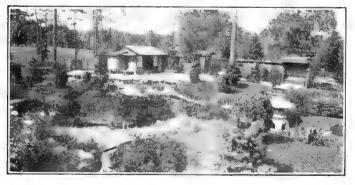

A GLIMPSE AT THE RHODODENDRON DISPLAY.

these plants about the grounds) with their thousands of cerise flowers, must have been a gorgeous sight in bloom, although we were too late to witness it. Our illustration on the cover page is reproduced from a photograph of a beautiful specimen azalea Amoena on the Gould estate, which is claimed to be the largest in existence, measuring over twelve feet in diameter.

Lakewood being regarded as a winter resort, the plantings of evergreens predominate and we saw beautiful specimens of spruces, pinus, taxus, retinisporas and other species, the whole making a grand display and showing good taste in architecture and landscape.

The Japanese garden is one of the show features of the estate, with its combination of color and streams of water and miniature water falls. The sunken garden with its marble steps and beautiful statues which lead to it, is a marvelous piece of work where art and skill combine.

The residence itself is a beautiful structure nestling among the pines surrounded by lawns which make a pleasing effect. We were all much impressed with the

JAPANESE GARDEN-AN INTERESTING SPOT.

beauty of the lawns, of which there are over one hundred acres; they looked so green and fresh!

The whole estate, which has an area of over two hundred acres is devoted entirely to pleasure and sport. Polo, golf, tennis, boating and shooting are induged in, in their seasons.

The range of greenhouses is an innovation to one on his first visit to them. Here chrysanthemums, carnations, roses, gardenias, orchids and other flowering plants

RESIDENCE OF GEO. J. GOULD, ESO .- GEORGIAN COURT.

are growing by the thousand and they were all found in excellent condition. Other houses are devoted to fruits and vegetables. Grapes, peaches, nectarines, tomatoes, cucumbers, beans, cauliflower, lettuce and even cabbage are found growing under glass in abundance.

ITALIAN GARDEN WITH CASINO IN BACKGROUND.

Mr. George J. Gould is said to be an ardent lover of nature and this seems to be exemplified by the entire appearance of his estate. Its development appears to be one of perfection wherever the eye can see.

Joseph Mills, the superintendent, a young man still in

ENTRANCE TO THE SUNKEN GARDENS.

his early thirties, received his early training on some of the finest estates in England. He has had exceptional experience both outside and in the greenhouse and consequently is well fitted for the position he now holds. Much credit is due Mr. Mills and his able assistants for the splendid up-keep of Georgian Court.

# The Children's Home Garden

By Elizabeth Chase.

A tragedy has been apparent to many who have taught school in Vermont during the past few years. Slowly but persistently it has dawned upon the minds of those who have had to do with education, or think about it at all, that something has been vitally wrong with our educational system. There has been a remarkable spectacle of people rearing children whom they love and for whom they toil, and yet, in whom, from earliest childhood, they have instilled the idea that they should live their lives when grown up in some better place than that in which they were born. They, the parents, with the help of the public school system, have diligently and constantly educated their children away from their native environment. Their eyes have grown long sighted in looking for the pot at the end of the rainbow while stumbling over the opportunities at their own doors. This training added to the natural tendency to migrate which we all inherit, has made sad havoc of our small villages and rural communities. Each year the best of the youths have gone away leaving inefficient ones behind. There have been exceptions to this rule always, and yet it is true that the best, to an alarming extent, have been encouraged to leave home as early as possible, and have done so. Following them to their distant fields we observe that in most cases they make no greater nor less success of themselves there than they would have had opportunity to make at home. Their native places have frequently fallen to decay which is a cause of regret as they grow older, when the thoughts naturally turn with sad reflection and affection to the undeveloped opportunities and scenes of their birthplaces. Villages have not thrived as they should, not having been well fed by the outlying farm districts. The boys who have left the farms when young finding themselves without work in trying industrial times may return to the farm but they have unfitted themselves, many times very seriously, by not keeping pace with farming methods.

The idea grew in our mind that parents and educational systems might better train the children by interesting them in the occupations of their home environment, training them to make the most of home opportunities. In this way they might become more useful and better citizens, developing greater love and respect for their native town and be better equipped to live their lives either at home or in bigger places, if called there.

That is why a small attempt was made some twelve or fifteen years ago to interest some children in a Vermont village in school gardening. After two years' trial it was a failure. Why? First, because the children came from scattered districts and when the long vacations came school and all that pertained thereto was left far behind. Secondly—we found human nature to be selfish. No few children, however convenient for them, would take care of the school garden when the other pupils were scattered and not able to do their share of the Since then we have learned to look upon this trait more as a part of the natural independence which is developed especially in every individual who lives in farming districts. We also came to realize that when almost every boy and girl has plenty of land at home that they do not need to have a small tract loaned them. So, then, because of the scattered conditions, because of the independent natures and because they have land of their own upon which we want a goodly number to remain, we concluded that home gardens were best for our country boys and girls. School gardens are impractical for country schools; only as a small demonstration, one can be used. We believe that hot beds at the country

schools are excellent, however. In these they may start early plants and transfer them later to their home gardens.

Opportunity came, five years ago, to try home gardening with children. Two years were spent with very small results. It was easy from the first to interest the children, but the indifference or amusement of the parents was often disheartening and in a few instances impossible to surmount. During this period few people knew about the attempt. By the third season, however, the work was well established, the enthusiasm of the children being sufficient to make it a success. In them had been created an interest so keen that they pestered fathers and mothers continually until they were allowed to have a small plot of ground for their own and could join the garden class. Commercial results were also making the parents consider the matter seriously. But one rule was made in joining the class. It was explained to each one so that there could be no question of his misunderstanding, that he must do all his own work after the ground was ploughed and fertilized. No name was accepted without verbal agreement to this proposition. As the class has grown rapidly in numbers during the past three seasons, a few instances have been apparent where children have not done all their own work. Each time the dishonesty has reflected upon the weakness of parents who, in their anxiety to have their children's work show up well, have taught them dishonesty by assisting them. When instances have been proved beyond a doubt that the children have not done their own work, they are not allowed to compete for the prizes. But we are giving undue attention to this point, the only unpleasant one we have ever experienced in this work, and for which our one rule is made. There have really been a surprisingly small number of children who have not been fair. On the contrary honest work is the rule and in several cases the enthusiasm has been so great that it has seemed best to hold the children back. The work has been carried on to some extent through the public school. Elementary garden books have been placed in the different schools and these the teachers have been kind enough to read with the children, or they have been taken home. Regular hours have been given us for talks upon gardening in the schools, when every phase of the work is discussed by the most competent people we can get. Plans for the gardens are drawn in school in the early spring days and all seeds required are secured through the penny packet system. Once each month during the spring and summer a journey is made together to some market garden, chicken, horse or dairy farm. These are made gala days.

Children from 5 to 17 years of age are admitted to the class and are divided according to age into three classes. New departments have been added to the work each year, as there has been a natural demand. General vegetable gardens, special crops, flower gardens and improvement in door yards have been on the list. This year lambs and pigs and maple sugar products will be new features. For each of these departments, prizes have been offered through the generous interest of Mr. Theo. N. Vail of this town and other friends. They are divided into two classes, those given for the work observed by the committee who visits the gardens once each month, and those given by the judges at the fair which is held every fall on the village green.

The prizes vary each year as it seems best to encourage the work of different departments.

The children are not encouraged to save their products

for the fair. They are urged to help supply the family table and to market everything at the right time. They are guided as much as possible in proper marketing. They are guided in raising the things that have special commercial value. A small child likes to make mud pies, but he likes to raise a plant of his own just as well—and as soon as he sees the fruit of that plant he will enthuse over the worth-while product of his labor and not over the mud pie. With occasional parties the work is made play and every four-year-old wants to be five years old so he may join the "garden class." Right there is the best and strongest point of the Lyndon Garden Work-the beginning with the child when very young. Five years is almost too late. We find that beginning with the very young we can develop almost a universal love for these occupations for which their home state is pre-eminently adapted.

We see no reason why this work cannot be done in any rural community and earnestly hope that it may.

(Children's gardens, whether school, neighborhood, city lot or home gardens, have become a potential force in child education; especially so in rural communities, and children's gardens should be encouraged. Elementary courses are taught in some of the schools of the large cities, but those children who have the advantage of practicing right in the soil become the greatest garden enthusiasts. The foregoing contribution by a pioneer in the work presents some valuable suggestions to those who are interested in the movement to keep the youth on the farm.—Ed.)

#### GROWING GRAPES IN POTS.

By Percy E. Hicks.

It is surprising that one does not see more grapes grown in pots, considering the small amount of space they take and the little care that they require for the quantity and quality of the fruit that can be got.

Take on private places where there is only a small amount of glass; if you have a small light house where you can maintain a night temperature of from 65 to 68 degrees I don't know of anything that is prettier or that would give your employer more satisfaction than a nicely finished house of grapes in pots

They are of easy culture; take three-year-old imported canes and give the same temperature as you would grapes in the border starting easy at first and gradually increasing. The main thing is to see that they do not suffer for water and feed liberally when fruit is set.

Black Hamburgh is one of the most satisfactory grapes for pots and my advice to any one that has not tried them is to get a dozen fruiting canes from some reliable firm and take good care of the airing, watering, feeding, etc., and it will give a lot of pleasure to yourself and your employer.

HOUSE OF POT-GROWN GRAPES, GROWN BY PERCY E. HICKS.

#### A CONFESSION.

What a glorious profession is that of the true gardener! He enjoys all the beauties of nature which his employer only glimpses between times!

He gets all the effulgence and none of the worries of

paying for it!

I have been crying like John the Baptist for more pay for the gardener. I take it all back.

The gardener ought to work for nothing and pay a premium!

G. C. Watson.

#### THE HAPPY GARDENER.

Oh! the glorious profession
Of the gardener—for just see
How he holds in his possession
All flowers, vines, shrubs and trees.

Even charms of old dame Nature He claims are his by right, And he for higher wages Now fain would go on strike.

In regard to compensation,
Well may the gardener smile,
For a balance in equation
Shows boss behind a mile.
Enjoying constant pleasure—
While boss gets scarce a peek
At dame Nature's golden treasure,
It may be once a week.

So to equalize life's burdens
I, George, the plan suggest,
That the gardener pay a premium,
He is so highly blest.

The foregoing lines were suggested by G. C. Watson's remarks on the subject. Let some one else give us the other side.

Newport, R. I.

ALEXANDER MACLELLAN.

(From Horticulture.)

# THE S. A. F. & O. H. CONVENTION GARDEN OF 1914.

The Boston reports on all Convention preparations are most satisfactory and very promising, thanks to the well united efforts and labors of the Boston organizations which are hard at work to make the coming convention a great success.

The Convention Garden, as planned and prepared by our enthusiastic brothers of our horticultural and otherwise well known and progressive Convention City, offers a splendid opportunity for the growers of all kinds of outdoor plants to display their goods and their skill. The garden is situated in one of the principal and most frequented parks of the city within easy walking distance of the Convention Hall. The general layout is very effective and the surroundings are most ideal. The grounds and their care are in the hands of most able experts, which, together with the favorable climatic conditions, assures successful culture of every plant that is sent there for exhibition or decorative purposes.

The Minneapolis Convention Garden was a success in every respect and has brought the aims and achievements of our profession and our organization nearer to the public than any other thing the S. A. F. has ever done, outside of its National Flower shows. The people of Minneapolis feel deeply grateful towards the National Society of Florists for the beautiful garden they planted for them and for the lessons it has taught them. The education of the public in this practical manner has already made itself felt amongst local florists, which is proof that such educational exploitation is at the same time practical advertising. Our daily press insisted that

the garden be continued in a similar way in the future and the display of 140,000 spring flowering bulbs, which was at its best a few days ago, brought out the following editorial from the Minneapolis *Tribune* of May 21:

OUR TULIP BEDS.

"Is there in another city of the world a sight so brilliant as the garden beside our Minneapolis armory? There it stands, the property of the poorest child as well as the richest grown-up who passes by. In every such life it is playing a part to-day—warming the soul with the richness of splendid color, quickening in it the love of nature, lifting it above the dusty drab of the day's business. Nature is a bold artist. Were any mere man to splash colors from a paint box in such gorgeousness, to parallel scarlet with canary yellow, to mottle pink and orange in the same blossom, the eyes would close tightly with the hurt. But the very splendor of these gav colors in the tulip beds makes them magnificent. It is as though nature laughed at our futile attempts to rival her and yet gave to us opulently of her most brilliant treasures. It is not so long since such a public garden would have been found far from the center of any American city if found at all. Men and women thought themselves 'practical' in those days; in reality they were only shortsighted. To-day the dweller of the American city sees fartherand he makes his children richer than he was with a succession of clean and wholesome interests as the best possible offset to the day's temptations.

"Our tulip beds are something more than a passing delight, this spring. They are a brilliant certificate of our widening vision and our nearer approach to fullness

of the spirit.'

To what better aims can we devote our professional labors and skill than to the recognized motives outlined in that editorial, and of what could we justly be more proud and happy, than to feel that our endeavors and achievements are deserving of such favorable impres-

sions, comments and recognition.

What has been started successfully last year can now be greatly enlarged upon in Boston, and a splendid beginning has been made. May I be accorded the privilege to ask every grower, florist and gardener to do his full share towards the success of our Boston Convention Garden, through active participation as an exhibitor. The Garden is all ready, and all that is now required is the plants to fill it. We want you all to help us in this educational work, and we want you to share alike the happiness, the pride, the glory and other manifold benefits of this progressive undertaking. Planting time is passing fast, so write to James B. Shea, Chairman, Convention Garden, 30 Beacon Street, Boston, Mass., for information and space. DO IT NOW!

THEODORE WIRTH, President, S. A. F. & O. H.

# A VISIT TO THE CONVERSE ESTATE, MARION, MASS.

The writer recently had the pleasure of a journey over the Converse estate at Marion, accompanied by Superintendent Roy. After walking about two hours around the grounds we realized that a vast amount of planning and an equally large amount of work must have been necessary to have so completely changed the eighty acres comprising this estate into such a picture.

As you enter the gate, if one takes the drive, a beautiful vista of stately trees banked with Rhodendrons promises a pleasing picture when the season arrives for the unfolding of the numerous buds into a gorgeous display. Preferring to walk, one takes a turn to the right and enters the Daffodil Walk winding its circuitous way among Nature's solitude from the gate to the green-

houses. Never in the walk could the eye escape the narcissus in all its loveliness. Bordering the walk are thousands of trumpet varieties, while peeping from among the undergrowth were seen the beautiful poeticus. Another gorgeous display was seen in the formal garden where nearly ten thousand bulbs of various kinds vied with each other in an effort to catch the eye. Emperor and Empress Narcissus were remarkably fine.

In the greenhouses everything showed the touch of the master hand, while the house containing a large collection of Hydrangea Hortensis, each plant bearing several trusses augmented by splendid specimens of pink and while spireas, was the center of attraction. In fact it was hard to turn in any direction without seeing something to hold the attention of any lover of Nature.

W. F. Turner.

#### SUN WARMS ONLY EARTH'S SURFACE.

How far does the heat of the full summer's sun penetrate into the ground?

Probably not one person in ten will give an answer that is even approximately correct, says *Tit Bits*. Their replies generally vary from one inch to many hundred feet. Actually the distance is about three feet. Beyond this depth the temperature of the soil does not vary appreciably from hour to hour, let the midday be ever so hot and the midnight ever so cold. At this depth the mean temperature in the summer is about 58 degrees Fahrenheit and in the winter about 36 degrees Fahrenheit.

And the annual difference? That is to say, the depth at which there is some difference between the summer temperature and that of the winter? Well, at a depth of 60 feet it is impossible to measure any change due to the changing seasons overhead. Go down only 40 feet and it is minute—barely measurable. But at 25 feet to

30 feet it is quite a definite amount.

The surface heat takes a long while to penetrate downward. In fact, curiously enough, the change in temperature of the ground takes just over six months to reach the end of its 25-foot journey. Thus we are faced with the phenomenon of midsummer upon the surface occurring at the same time as midwinter 25 to 30 feet down, and vice versa.

As most people are aware, the temperature increases with the depth. At three feet down the average annual mean is just short of 45 degrees Fahrenheit, while at 25 feet it is just over a degree more, that is 47 degrees Fahrenheit.

In agricultural districts you will hear farmers in the same village talking about "cold" soils and "warm" soils. This, although it sounds improbable to those who have never had anything to do with the land, is an actual fact.

Everybody knows from personal experience that black clothes are hotter to wear when a hot summer's sun is shining than white ones, hence the "flannels" for men and the white frocks for girls. The reason for this is that black and other dark colors absorb heat, while white and the lighter shades reflect it. And this applies to soils equally with clothes.

Those soils which by their ingredients are a darker color are literally warmer than their lighter neighbors. Peaty soils, some of which are nearly black, others a rich, dark brown, are the warmest. Light colored clays and chalk the coldest. There may be as much as 15 degrees or 16 degrees Fahrenheit difference between the temperatures of two soils, lying next each other, and upon the same day. On a warm summer's day the temperature of peaty soil may well be over 87 degrees Fahrenheit, while a chalky field of similar situation in the same district will not rise above 73 degrees to 74 degrees Fahrenheit

Vol. XVIII.

JUNE, 1914.

No. 2.

In August next we will witness what will probably be the greatest gathering of floricultural and horticultural interests ever brought together at a convention in this country. Boston, which today many regard as the hotbed of horticulture in America, will be the meeting place. The convention will be that of the Society of American Florists and Ornamental Horticulturists. The published reports of the preparations under way give every evidence that not alone the usual trade exhibits, but the outdoor garden plantings will surpass anything of their nature ever attempted heretofore.

The National Association of Gardeners will meet in Boston at the time of the convention, its sister society having graciously included the meeting of the gardeners' association in its general program.

Attendance at Boston during the S. A. F. convention offers a trip both for pleasure and profit, and the gardeners should not miss it. Pleasure, in meeting with the men who have been instrumental in the upbuilding of horticulture in the past decade; profitable, in the knowledge you will glean from a visit to the outdoor garden, studying what has been accomplished in this competitive

planting; and from a visit to the convention's general trade exhibition.

Make Boston during the week of August 16 a part of your 1914 outing. You will not regret it.

Co-operation between the gardeners' societies is no longer an advocated theory; it has become an established fact. Action has been taken by some of the prominent local gardeners' societies to bring this about, the moving spirit behind the plan being the gardeners' national association. The prime motive of the co-operative plan is to create a more intimate knowledge as to what constitutes the ability of the gardener who is thoroughly proficient in his profession—to disabuse the public mind of the mistaken notion that simply because a man knows how to mow a lawn and dig potatoes he is entitled to the title of gardener; and to promote a greater appreciation, on the part of those who employ them, of the value of the services gardeners render; to arouse a keener general interest in what the gardener produces; and, finally, to provide for the gardener, not so situated as to be able to acquire scientific knowledge through a college course, opportunities through their own societies to obtain this education to apply to their practical experience.

The gardeners' co-operative movement is entitled not only to the support of the gardeners, but of all interests allied with the gardening profession. Its sponsors recognize that the plan is no small undertaking and that it needs the boosts of the friends of the profession, as well as the "knocks" of its critics, to bring to it the publicity

it desires and deserves.

#### THE IMPORTANT MAN.

You are important if you put yourself in the way of important things to be done-and do them.

The years, since history began, have produced dreamers and air castle builders, whose imaginary achievements would have astounded the world had they actually put their mind pictures into reality. But all along, such have breathed out their span and died ordinary and unknown.

The Important Man is he who puts his dreams and

great imaginations into works.

The men who pave our streets and plough our soil, and run our machines, and write our books-and who do whatsoever useful things that come to hand—are important men. The task is not always indicative of the importance of the man. But the man is always indicative of the importance of the task.

Your future importance depends upon the importance you place in the things you now do.—Philadelphia

Bulletin.

#### THE ONLY WAY.

There's only one method of meeting life's test, Jes' keep on a strivin' and hope for the best. Don't give up the game and retire in dismay, 'Cause hammers are thrown when you like a bouquet. This world would be tiresome; we'd all get the blues, If all the folks in it held just the same views. So finish your work, show the best of your skill, Some folks won't like it, but other folks will.

If you're leading an army, or building a fence, Do the most that you can with your own common sense. One small word of praise in this journey of tears, Outweighs in the balance 'gainst a cart load of sneers. The plants that we're passin' as common place weeds Oft prove to be jes' what some sufferer needs. So keep on agoin', don't stay standin' still, Some people won't like it, but other folks will. -Philosophy of William F. Gude.

## NATIONAL ASSOCIATION NOTES

M. C. EBEL, Secretary, MADISON, N. J.

#### THE SUMMER MEETING

The summer meeting of the association will be held in Boston during the convention of the Society of American Florists and Ornamental Horticulturists. This decision was reached at the last meeting of the executive board. Many gardeners are members of both organizations and it will give them an opportunity to attend the meetings of both bodies. The program of the meeting will be published in the next issue of the Chronicle. It is expected that a number of speakers, men who have gained prominence in the horticultural world, will address the gardeners on topics in which they will be directly interested.

Members intending to attend the meeting going via New York, will find the *outside route* to Boston a most enjoyable one; leaving New York Monday afternoon, August 16, at five o'clock and arriving at Boston the next merning at eight o'clock. This route has also been selected by the New York Florists' Club, which will journey to Boston on the same steamer as the members of the National Association of Gardeners.

the National Association of Gardeners.

Those who expect to attend the meeting and who decide to join the party going on the outside route should

ONE OF THE OUTSIDE LINE STEAMERS, NEW YORK-BOSTON.

apply to the secretary for reservation of staterooms at the earliest date possible. A number of rooms have been reserved and will be assigned as applications are received. Outside rooms are \$2; inside rooms \$1; both rooms containing two berths. The fare to Boston is \$4. Unless rooms are secured well in advance it will be hard to obtain them owing to the fact that the time of the meeting is the busiest season for summer traffic.

The Copley Square Hotel, Boston, has been selected as the headquarters of the N. A. G. This hotel is located conveniently to the convention hall and is reasonable in its prices. Reservations for rooms should be made as soon as possible, either by applying to the hotel direct, or through the secretary's office. The hotel has submitted the following convention rates: Single room without bath, \$1.50 per day; larger outside room, \$2; court room, with private bath, \$2 a day; outside room, with private bath, \$3 a day. The above rates are for one person; \$1 additional per day will be charged for two persons occupying one room.

# THE GARDENERS' CO-OPERATIVE MOVEMENT.

Seventeen local societies have so far taken favorable action on the gardeners' co-operative movement, which is being fostered by the national association, and have ap-

pointed local co-operative committees. Quite a number have signified their intention of participating in the movement but have deferred taking definite action pending further information as to just what the plan contemplates. There are others still to be heard from. Attention is directed to the article appearing on page 52, which suggests the field for development, through co-operation between the national and local societies, to benefit the gardening profession and those who are following it.

#### NEW MEMBERS.

The following new members have been added to our roll during the past month: Charles E. Carman, Springfield Centre, N. Y.; Walter G. Weston, Lakewood, N. J.; Joseph Winsock and Herbert Dungey, Deal Beach, N. J.; James L. Spalding and William Simpson, Monticello. Ill.; John Johnson, Southampton, N. Y.; Ernest Lieb, Sterlington, N. Y.; Arthur J. Wise, Montpelier, Va.; Benjamin G. Cartmell, Wyncote, Pa.; John Jay Howe, New York, N. Y.

#### PROTECTION IN FORWARDING DUES.

Duplicate bills are about to be sent out to those who have not yet remitted their 1914 dues. The secretary's office desires to direct attention to the risk involved in sending cash through the mail without properly registering the letter and announces that hereafter the office will not assume any responsibility for dues remitted in that manner. In the past it has necessitated considerable correspondence and unnecessary investigation in trying to trace dues which were reported sent in cash and which did not reach the office. It is suggested that where it is not convenient to send a check, a post office or express money order be forwarded, as this protects the sender; or send cash by registered mail, demanding a return receipt of delivery from the post office. Then you will have something to trace your letters by if they go astray.

# APPLICATION FOR MEMBERSHIP

# National Association of Gardeners

I hereby apply for Membership in your Association:

Name in full
Occupation
Address

Date
Reference

Forward Application to M. C. EBEL, Secretary, Madison, N. J., with dues, which are \$2.00 annually, including subscription to the official organ of the Association

# AMONG THE GARDENERS

Joseph Wood, formerly assistant at "Georgian Court," Lakewood, N. J., is now gardener to Mr. Charles B. Noyes, "Cloverhurst Farm," Bridgeport, Conn.

G. A. Reid, a graduate of Amherst College, has secured the position of assistant manager on the estate of Mr. F. C. Littleton, Mamaroneck, N. Y.

Michael Collins recently accepted the position of gardener on the estate of Mr. Oscar S. Straus, Purchase, N. Y., which place Mr. Straus has purchased from Mr. Harry S. Black.

A. A. Macdonald, of the Duke estate, Somerville, N. J., expects to sail on July 14 for a two months' vacation at home. This will be Mr. Macdonald's first visit abroad in thirteen years.

Bernard Greeley has been appointed head gardener on the estate of Mr. J. W. McCahan, Moorestown, N. J. Mr. Greeley was formerly gardener on the General Miller estate, Franklin, Pa.

N. A. Butler, recently foreman on the George F. Baker estate, Tuxedo Park, N. Y., has accepted a position as orchid grower on the estate of Mr. George A. Gould, "Georgian Court," Lakewood, N. J.

J. Johnson, formerly assistant gardener on the D. S. McAlpin estate, Morris Plains, N. J., has secured the position placing him in charge of the G. Warrington Curtis estate, Southampton, N. Y.

Frank Jenkins has succeeded Nicholas Butterbach on the C. Lewis estate, Mahwah, N. J. Mr. Butterbach was engaged in development work on this estate, from which he recently resigned to accept the superintendency on the Ward estate, New Rochelle, N. Y., as reported last month.

William Kleinheinz, superintendent of the P. A. B. Widener estate, Ogontz, Pa., expects to leave for a trip to Europe, accompanied by Mrs. Kleinheinz, about July first, to be abroad two months. The trip will include both business and pleasure, as Mr. Kleinheinz will make some purchases while abroad for improvement work now under way on the Widener estate.

# PRELIMINARY SCHEDULE OF PRIVATE GROWERS' CLASSES INTERNATIONAL FLOWER SHOW, NEW YORK, MARCH 17-23, 1915.

Plants in Flower.

#### "IT CAN'T BE DONE."

and bronze medals for exhibits of unusual merit; the exhibits to

be judged and the awards to be made by the society.

The man who misses all the fun Is he who says, "It can't be done!" In solemn pride he stands aloof And greets each venture with reproof. Had he the power, he'd efface The history of the human race; We'd have no steam nor trolley cars, No streets lit by electric stars; No telegraph nor telephone. We'd linger in the age of stone, Where when some keen barbaric brain Of life's conditions dared complain, And planned a wheel on which to roll The load his arms could not control, Sneers rose from all the mighty crew That ever scoffs at what is new. The world would sleep if things were run By men who say, "It can't be done!" -Washington Star.

#### PARTS OF A FLOWER.

The various parts of a flower are looked upon by botanists as being modified leaves. The outside covering of the flower bud is termed the "calyx." Its purpose is to protect the more tender parts within, and it is generally green in color and quite leaf-like in texture. Within the calvx, the next row of leaves constitute the "corolla," each leaf being called a "petal." These are generally white or of some brilliant color, and not only serve as a protection to the inner parts, but by their bright color attract insects which assist in pollination.

Within the corolla the next row of modified leaves are the "stamens," which at their tips bear small yellow or brown pouch-like vessels called the "anthers," and which contain the male element or "pollen." Within the circle of stamens is one or more slender greenish stems called the "pistil," the outer end of which is more or less enlarged and sticky on the upper surface. This enlarged portion is the "stigma." At the lower end the pistil is considerably swollen and is called the ovary. This develops into the fruit or seed pod, and within it are the ovules, which, after pollination, become the seeds.

# The Gardeners' Co-operative Movement

Co-operation between the National Association of Gardeners and the gardeners' local societies had its inception at the meeting of the executive board of the gardeners' national organization held in New York in January last. The prevailing opinion at that meeting was that the association had reached a state where it is to be regarded as solidly founded, recognized as an influential factor in ornamental horticulture, with a membership representative of the best element within the gardening profession—and that the time had arrived for it to take some definite action to benefit the profession which it

represents.

Co-operating with the local societies, it was agreed, would afford the greatest opportunities for effective work of national scope; thus it was decided to communicate with the different local societies throughout the country to obtain their views on such a movement. The response was so favorable that at the meeting of the executive board held in Philadelphia, in April, the co-operative plan was placed into being and an invitation was extended to the local societies to have those desiring to participate in the movement appoint a committee of three members of their society to work in conjunction with the committee of the national association, which committee is to be known as the National Co-operative Committee. As enough of the local societies have already appointed committees to assure sufficient support from different parts of the country to make the movement a success the National Committee is preparing to begin its activity in the early fall, being now engaged in working out the details of its

Just what can be attained through a co-operative movement between the local societies and conducted through a national source cannot be foretold, for it will depend largely on the interest taken by those who engage in it. If the various committees can be sufficiently interested to seriously engage in the work before them much can be accomplished for the good of the gardening profession as a whole; and incidentally for the development of the local societies themselves. It will require whole-souled energy on the part of those entrusted with the undertaking to produce the expected results. Half-hearted effort will not aid but will retard the cause. There are those who regard possible success of this movement which involves relying on scattered sources with much scepticism; but I believe that there are members in every gardeners' society who, if they find that they can serve their profession, will willingly give the time to do so; and who can be relied on to perform the functions of a committee which a movement such as the one under discussion will

call for.

The membership roll of the National Association of Gardeners spreads over practically every state in the Union so that its mission is not in any sense a local one, but is a national one; while the influence of a local society is in most instances confined to the sphere of the community in which it is located. The gardeners' problems concern both their national and local societies and working out their solution is the business of both of them. Conditions in all communities are not alike, but the unfavorable ones where they do exist are closely related in most cases. Through co-operation many of the conditions may be improved. To strengthen the profession conditions governing it should be more uniform; more alike in every direction that the profession reaches. By studying the general conditions systematically, endeavoring to eliminate the bad and trying to better the good in them, the profession cannot fail to benefit; and such

benefit will reflect in the individuals who are entitled to the calling of gardener.

Most gardeners, especially the younger men who are not yet firmly established, are as much interested in the probable compensation they will derive from their proression as they are in any other phase which enters into it, and this is but human nature; for experience has taught that it costs to live, although now and then the sentimentally inclined suggest that the gardener must find his real compensation in the joy he derives out of his vocation. Opportunity is presenting itself for a campaign of education in a co-operative way for improving what is now a very unsatisfactory situation; for it is only too true that the gardeners themselves are as much to blame as are the employers, for the poor remuneration that comes to so many of them and which often is out of all proportion to the responsibilities they are expected to assume. To substantiate this contention it is only necessary to allude to the practice of many gardeners when seeking a position, who, on learning of a vacancy, file their applications specifying salary expected, without considering as to whether the position applied for warrants a better salary than asked, or whether they are even qualified to apply for it. They have simply made up their mind to secure the position if they can and have just one object in mind -to get employment at so much a month. Through this practice many good opportunities have been spoiled and as a consequence thereof estate owners engaging unfitted men have become disgusted with their experience in attempting to maintain country estates; and they are frequently wont to blame the profession as a whole for their experience with a few individuals in it. To educate the estate owner that a gardener thoroughly efficient in his profession is entitled to more than the most of them are disposed to pay will make it necessary to strike at the root of the evil. The fact must be made known to these owners that the men who proffer their services for small pay almost invariably are small men in the profession; that a capable gardener is entitled to, and expects proper compensation for his services, just as do the capable men in other professions.

It should not be amiss to suggest here that salaries within the gardening profession can never be regulated, or fixed, as some choose to call it, either through co-operation or by means of any other methods. Professional gardening will always be looked upon as acquired luxury by those who employ it and not as a fixed necessity. This will prohibit the enforcement of any regulations such as govern trades and labor in general, and those who are possessed of the knowledge and skill required of the thorough gardener must rejoice over the fact that they are above the domination of such regulations. What is necessary is to establish a closer relationship between employer and gardener; and to instill a greater confidence in the gardeners' ability; and to arouse a greater interest on the part of the owner in what his gardener is producing for him. When this confidence and interest is once properly created, the relationship of employer and gardener will become such that compensation will be a matter of individual adjustment and not to be fixed as is from

time to time advocated that is should be.

That the profession has not gained the recognition to which it is justly entitled, is due to the almost total ignorance of people as a whole regarding the essentials to properly fit a man for the calling of gardener; for it is commonly accepted that any man who can hoe, dig and sow is qualified to pass as a gardener. Only few people know of the years that must be spent in hard work and

study before one can even gain a fair knowledge of the fundamentals of this profession; and what learning a gardener must acquire before he can declare—I am a master of my vocation! It remains with the gardener to disabuse the minds of people that gardening is but little more than ordinary labor and to teach them that it is based on scientific principles, obtained only through long practical training. And how can you better elevate this profession in the eyes of those who do not yet know it as such, than through co-operating to bring your accomplishments nearer home to them through the activities of your national association and local societies?

Let us turn to the local societies whose influence to-day is restricted to the communities they serve. Is there any reason to doubt that through co-operation with the national association their influence, which is now purely local, could be made nation wide? Is there any reason why through such co-operation the gardeners' national and local societies should not be able in time to wield a similar influence as do the legal and medical societies and those of other sciences? These professions have been developed by the organizations which represent them; and their interests are now being carefully guarded through these organizations, which in almost every instance constitute a national and local societies working in conjunction and in harmony with each other. What these organizations have done and are doing for their respective professions can also be accomplished for the gardening profession if the same persistent effort is put forth that they employed. The local problems of a profession can usually be coped with by the local body. But those problems which concern the profession as a whole require united application to work out their solution. Until a profession is thoroughly organized this is difficult to attain; but once the national and local associations become co-operative, a base is established which provides the munitions for concerted action, and prepares the way for the profession's aggrandizement whenever the opportunity presents; and for its defense if occasion requires.

The educational possibilities and benefits that are to be derived from closer association between the national and local bodies must not be overlooked.

A contributor to the horticultural press, himself an eminent gardener, recently wrote:

"If the profession wishes to obtain that full and complete recognition to which its requirements and knowledge entitle it, still further steps must be taken to place itself in the professional class by acknowledging the value and necessity of scientific attainments. Men are graduating every year from agricultural colleges who on that account consider themselves fitted for the position of private estate managers. Employers too are in many cases under the impression that a college man is necessarily better than one without college education. though plenty of instances can be found where college men have fallen down when they have attempted to run either a farm or garden, this has not been because of, but in spite of, their college education. To produce the best results practice must be combined with science so that a man may have a knowledge of the why and how of what he does. A man with practical experience who will take the trouble to acquire a working knowledge of the scientific principles of his profession can do so with greater benefit to his practice than a man starting to learn these principles without any practical knowledge whatever. . . . Whatever value the experienced gardener may himself place upon the knowledge and skill gained through years of study and practical

work he must make up his mind that scientific education has come to stay and act accordingly."

What this writer states is a condition that the gardener of the future will have to contend with even more so than the gardener of to-day, and he must prepare himself for The young men serving their apprenticeship, and all others not too old to learn, should be encouraged in seeking scientific knowledge which they might apply to their practical experience. Most of them cannot seek it at college, so their local society should be their source to which they might look for at least part of this education which they cannot obtain through their manual training. Some of the stronger local societies have in the past conducted successful class studies in various departments of horticulture, and if sufficient interest should manifest itself, it would be no stupendous task to inaugurate a regular system of teaching in which all the local societies might participate; and the installation of such a system should in time lead to the adoption, by the national association, of a plan similar to that of the Royal Horticultural Society of England, providing for examinations to gain an association's diploma, which should bring to the possessor distinction in his profession.

Through an exchange of views and the disseminating of reports of the doings of local societies, the experience of one may aid others and the accounting of the upbuilding and success of the strong may prove helpful to the weak.

It pays to advertise! This axiom is as applicable to a profession as it is to a business or to an individual. The other sciences seize every opportunity to keep before the public eye, and the time is at hand when the oldest of all the professions must attempt to get before the public eye and remain before it. As an example, take the flower shows. Thousands attend, admire the heauty of flowers and plants, but how many give one thought to the skill that creates them? You ask why do they ignore this? Because little is known of the profession that makes flower shows possible. Publicity of it must no longer be confined to the horticultural press alone. Its progress must be heralded broadcast. It is a national task, not local, and will require the co-operation of the national and local forces.

In what I have presented in behalf of and as a plea for co-operation, I have only skimmed the surface of the subject. The field for achievement is tremendous, and opportunities will materialize as the work progresses. Immediate results are not to be calculated on. The profession has been as long as the world is old getting to where it finds itself to-day. Time will be consumed before the profession can be advanced to where its followers may come into their own, and many will have gone to join the Master Gardener before then, but the elevation of the profession is not intended for to-day, or to-morrow, but for always.

In conclusion let me say that the national association and the local societies will make but slow progress singly or co-operatively, unless the support of the members individually stands behind them. Let me urge that no gardener assume the attitude of the old Scotchman, who, on being warned that he would lose his sight if he did not stop dissipating, replied, "Well, I guess it's no matter, I've seen about all's worth while." If you feel content that the profession has treated you well and owes you nothing, remember that you owe it to your fellowman, less fortunate than you, to lend your aid in the uplift for genuine gardening.

Address by M. C. 11cl, Secretary N. P. C. Coat in A. Intimers, before the West he for ind Fairfield Sci. Conversion on the Sci. 1914.

#### CIRCULATION OF WATER IN THE SOIL.

BY MAUD DEWILL PEARL.

With the great growth of agricultural science which has taken place within recent years many ideas which have been accepted a priori as settled, have been shown to have little or no basis when investigated experimentally. With the recent publication of the results on circulation of water in the soil by a Russian, Mr. Rotmistrov, we are compelled to change our ideas concerning the rise of water from deep layers of soil to the surface by means of capillary attraction. The experiments at the Odessa Experimental Farm were such as to preclude to a very great degree any error in the work. A special borer which prevented pressure out of or into each sample of soil taken, as well as any change in the moisture content of the sample from the time it was obtained until it was tested, was used. Over 60,000 estimates of soil humidity were made covering a period of several years.

Circulation of moisture in the soil takes place in three directions: upwards, downwards and sidewards. But Mr. Rotmistrov found that the upward movement is very much less than it is ordinarily supposed to be. The field experiments were made under all conditions of soil humidity. These were augmented by laboratory experiments and similar results obtained.

The conclusion is reached that it is only when the soil is saturated that there is a rise of water, by means of capillary attraction to the surface, and that this upward movement is very slow indeed and only involves the moisture to a certain depth. Below that depth those layers only loose water upwards which are invaded by the roots of plants. "Thus, if winter wheat be sown in a field under black fallow having stored up water in a layer of over two meters (6½ ft.) there will be found by harvest time an impoverished layer of from 120-130 cm. (about 4 ft.), for this depth is the limit required by the roots of winter wheat for their development."

There is every indication that when the soil is not saturated but the upper layers are dry and loose, no water comes to the surface in liquid form whatever, but in the form of vapor. This is due to the fact that the spaces between the soil particles are filled with air. Some of the water, as it comes in contact with the air, will vaporize; the remainder, being heavier than air, will tend to sink deeper into the soil. Increasing the capillary system of the deeper layers of the soil and thus raising the level of moisture nearer to the surface is considered, by the investigator, to be a supposition which experiment will not support. In this connection he brings out a fact which is of value to all agriculturists. When preparing ground for planting, if the soil is non-saturated, rolling it with a sub-soil roller will make conditions much more favorable for the development of the seed. In the rolling process the air is forced out of the spaces between the particles of earth and at the same time a certain amount of moisture is forced in.

In regard to the movement of water downwards, Mr. Rotmistrov says: "All data point to one conclusion, viz.. that water percolating beyond a depth of 40-50 cm. (15-20 in.) does not return to the surface except by way of the roots; all the water not seized by the roots goes down into the deeper layers, moving at the rate of about seven feet yearly." The greatest accumulation of ground water he believes not to be so much from water running in to the deeper soil from hollows, where it has accumulated during heavy rainfall, from melting snow, etc., but from soil moisture, which, escaping the grasping roots of vegetation, gradually sinks deeper and deeper into the earth.

Finally, by a series of experiments, Mr. Rotmistrov

has proved that moisture penetrates horizontally in the soil at the same rate that it penetrates downward.

#### SUCCESS IN WOODLAND PLANTING.

In an article on Private Estate Forestry in the March issue, mention was made of a planting of some sixteen thousand three year old conifers during the latter part of November 1912. Some readers may be interested to know that the losses are practically *nil* being about one half of one per cent. Of course conditions were exceptionally favorable. Weather was such that root growth was doubtless made for about two months subsequent to planting and when frost came there was a good covering of snow which continued until late. The soil, too, being naturally well drained on account of its stoniness is not liable to heaving.

In reference to autumn planting in general of little trees in large numbers where artificial mulching is out of the question, one must use discretion and take all circumstances into consideration. Where soil is clayed or undrained and therefore liable to heave it would not be advisable to plant these kinds of trees at so late a date. The reason why we deferred the planting until the above date was because there was not sufficient moisture in the ground earlier to keep the trees alive and earlier planting would undoubtedly have resulted in considerable loss by drying out.

The present spring, in spite of the late date on which we could start, has been one of the most favorable for planting which I can remember, and the thirty-five thousand young trees set out in their permanent position and fifty-five thousand in the nursery, are looking remarkably well. Trees planted in previous years are putting forth very luxuriant growth and evidently intend making a considerable step upwards this season.

With reference to taxation of reforested land, the following appears to be the position in the East, so far as I have been able to get information:

Connecticut—Taxed annually upon the value of land alone, rate not to exceed 10 mills, plus a yield tax of ten per cent, on the value of timber when cut.

Maine—Not less than 640 trees to the acre three years after planting, tax exempt for thirty years.

New Hampshire—Land planted with at least 1,200 trees per acre, tax rebated, first ten years 90 per cent.; second ten years 80 per cent.; third ten years 50 per cent.

Massachusetts—Plantations of not less than 2,000 trees to the acre upon land which does not exceed \$15.00 per acre in value, exempt from taxation for ten years after trees have grown four feet.

New York—Not less than 800 trees to the acre, tax exempt for thirty-five years.

Pennsylvania—Tax exemption for reforested land now before the legislature.

Rhode Island—Land not worth more than \$25.00 per acre and planted not less than 500 to the acre, tax exempt for fifteen years.

Vermont—Reforested land tax exempt for ten years.

ARTHUR SMITH.

#### HAPPY THOUGHTS.

"Think happy thoughts, O friend, in sunny weather!
"Tis easier when the skies are deep and blue.

Let thy heart and the robin's sing together,
And thy clear eyes be tranquil as the dew.

So rich a store of memories thou shalt gather, So tranquil grow thy spirit and thy brain,

That when the winds blow fog and stormy weather

Thou shalt have sunshine though the earth have
rain."
—Selected.

# Plant Life in the Mexican Arid Regions

By Elmer Stearns.

The plant life in this region is a good example of the "survival of the fittest." The spiny plants and trees so common here did not become spinous by chance, but in each generation it was the one that was the best protected by such devices that escaped the rabbit, deer or other animal. If it was not so well protected, the large cactus, Echinocactus wislizeni, some times called "barrel cactus" on account of its size and shape, would soon have been exterminated, for this pulpy plant contains possibly two hundred pounds of food and water for a cow or a deer, and more than a month's food and water for a rabbit. But it is armed with many rows of hooked and protective spines, two or three inches long, and so strong that they can tear the flesh like a fishhook. With a knife a Mexican strips off the spines and the skin, and cuts the juicy white pulp into squares that he boils in a crude raw sugar called "peloncillo" and makes sufficient "cactus candy" to last his family for many weeks.

The great hundred-headed cactus, called by the Mexicans "pitahaya" but in our simple botanical language Cereus stramineus, with spines two inches long, produces in abundance a delicious fruit flavored like

the strawberry.

This is about an inch in diameter, with minute black seeds. It is covered with scattered groups of small spines that drop at a touch when ripe, provided you are accustomed to handling them; if not, they stick in your fingers, and break off, leaving the end in the flesh,

Another characteristic of many of these plants is the long life of their seeds. Many of these are provided with covers that preserve them from decay, and prevent the water from soaking them. Some of these plants will remain for months with their roots and leaves as dry as a bone, and when a rain comes will immediately revive and flower and bear fruit.

I have seen the "resurrection plant," Selaginella lepidophylla, growing on face of bare rocks, apparently without a particle of soil or of food material except that sometimes they cling where the roots may enter the crevices in the rocks. These grow in such abundance that they may be gathered by the barrel full. Other plants, starting with a small root, have through time become possessed of large perennial roots adapted to the storing of water and of food, so that even should there be no rain, as often is the case, these plants will yet grow, bloom and bear fruit.

Among some of the more prominent of this class may be mentioned the Jatropha macrorhiza, with a root often weighing ten pounds. The plant is about two feet high, with leaves much like those of the castor oil plant, to which family it belongs. The Mexicans use it as a medicine, by stirring their coffee with a piece of the

fresh stem.

Another plant with a big root is Apodenthera undulatae. This is related to the melon, and has similar vines. What a relief it is, when coursing a bare, dry valley where the other plants are dry and dead, to see this and Jatropha with their green leaves and beautiful flowers.

Another big rooted fellow is Maximowiozia tripartita, also of the pumpkin family, and producing a small, pulpy, red fruit about an inch in diameter. The roots are dull scurfy brown in color and grow deep into the hard dry soil.

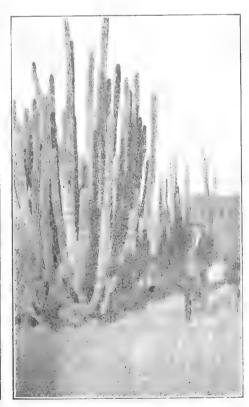

Cereus gregii is another curious and drouth resisting plant. All that you see of it above ground is a dry, brown stem that you never would suppose to be alive,

TREE-LIKE CACTUS, WELL BRANCHED AND ON A FIRM TRUNK.

SIZE OF SOME PLANTS PROUTLAR TO THIS REGION.

A NATIVE - . HE MENUS A COLUMN REGIONS.

for its appearance is that of a dead stick, with the lower part rotted away leaving only the heart wood. But far below the surface you will find a ten pound root shaped like a sugar beet. This cactus has a pretty flower that opens in the night.

Some of the desert plants have escaped extinction by reason of their strong odor. 'Polanisia uniglandulosa' is an example. It is so fetid that no animal cares to

touch it. The flowers are very pretty.

Probably Dame Nature never came nearer producing a "plantless spine" than when she made the shrubby, green spined bush, Koeberlinia spinosa, which the Mexicans call "junco." This is nothing but stem and spines, but it is so profusely branched that it forms a round head from three to four feet high. The flowers grow from these smooth, bare spines, forming umbels

of pretty little white blossoms.

All this plant life is the survival of unknown ages of change that began when this region was perhaps partly covered with water. The slow drying of these lakes permitted the plants to adapt themselves to the changing conditions. Many of these are so resistant that you may dig them up, or cut off branches and pile them in a dry room, and after several months find them still growing, throwing out new branches and even flowering. I piled some Opuntia cactus in a dry room when it was in flower and it continued to bloom and finally ripened the fruit. I have had some of the smaller succulent plants keep on growing while I was trying to dry them in my plant press. Some of these must be allowed to dry for a few days before they can be planted, otherwise they will rot in the ground. This is always done with the maguey. Surprisingly few of these growths are useless to man. The natives have cultivated and utilized them for centuries.

From the sotol is made an alcoholic drink. Many of the agaves, like the maguey, are used in a similar way. The thick, fleshy leaves, or the bases of the leaves which form fleshy bulbs, are cooked and eaten. All this class of agaves furnish a fiber, so that you may see a Mexican collecting the leaves and taking out the fiber, with which he makes strong sacks, cords, ropes

and even coarse clothes.

One of my pupils that lives in Sonora said that we could easily make an overland trip from C. Juarez, southwest, cross the Sierra Madre Mountains and come out on the Gulf of California at Guaymas, and during the journey he could get us enough roots, berries, nuts, leaves and other native foods to supply us and even enable us to live well, provided he could have a rifle for deer or for other animal food.

As I have had some days' experience with this boy on botanical trips, I know that he is as much at home in the hills and mountains as in the dining room, and as he speaks the Yaqui language he has no difficulty in finding his way among those people.

Only the magic touch of water is needed to make

these lands the richest in the world.

When we bring cultivated plants into these regions they often take on characteristics not found in those parts from which the seed has come. Great changes, are noticeable in the acidity of fruits, the greater number becoming sweeter. The long, hot days of sunshine have a marked effect upon the sugar content.

Nearly all the northern part of the State of Chihuahua, as well as Coahuila and Sonora, partake of this desert and semi-desert nature, and there is a similarity in the plants, although we find different species in each

of these three states.

Even the mountains on one side of a valley will have species different from those on the mountains of the

other side. This is due to the character of the soil. The Spanish bayonet (Yucca) thrives best on granite and quartzite rocks; the ocatilla (Fouquiera splenden) on clayey and slaty locations, while the cactus is most abundant on limestone or on lava formations. These preferences make the plants appear at times as if they had been purposely arranged in belts or rows.—Guide to Nature.

#### RAISING ORCHIDS FROM SEED.

One of the most progressive signs in horticulture is the fact that in almost every garden there is a desire to improve the different classes of plants, and to this end thousands of seedlings are raised annually. Orchids are no exception to this rule, and as seeds of most rare plants are usually offered for sale, I see no reason why the great orchid firms should not do likewise. The price, of course, would depend upon the value of the plants used for crossing and the possibilities of securing a percentage of good varieties out of the resultant seedlings. Plants with seed-pots have already been offered for sale, and if amateurs could buy seed, there would, no doubt, be a great impetus given to the trade.

Any one who contemplates taking up this interesting branch of orchidology would do well if he started with

Cypripediums, or any of the terrestrial kinds.

Seed should be sown, directly it is ripe, around the base of older plants belonging to the same genus for preference, although this is not essential. Select a specimen that will not require repotting for at least twelve months, and see that the surface is free from moss or any growth that is likely to choke the seedlings or impede germination. The soil ought to be just below the rim of the pot; then there is not so much fear of the seed being washed away. Several plants should be picked out for this purpose, because it often happens in the most up-to-date establishments that seedlings only germinate on one pot or seed-bed.

After giving the host plant a good watering, the seed may be sprinkled evenly over the soil with the blade of an ordinary knife. From now onwards the soil must never become dry, but extreme care should be exercised in giving water. If seed is sown in only a few pots, the receptacle may be stood in saucers of water until it rises to the surface, and, failing this method, a fine-rosed watering-pot can be employed. With ordinary care and attention, germination will take place in six weeks or two months, as a general rule; but the grower must not be impatient in this respect, as I have known seedlings to appear twelve months and even longer after the time of sowing the seed.

When they have made one or two tiny leaves, they may be removed with a pointed stick and placed singly in a 2-inch pot. The pots are filled with sphagnum moss, cut up rather finely, and all the large heads are picked off when sorting out the rubbish and slugs. When all the seedlings have been planted, the pots are plunged in some old peat or other moisture-holding material, and lightly sprayed over directly the moss looks dry. As growth advances, larger receptacles must be provided, and a little fibrous peat incorporated with the sphagnum moss. It is essential that the plants should be kept continually growing until they reach the flowering stage. A moist, buovant atmosphere must be maintained, especially during the spring and summer months, and a minimum temperature of 55° to 60° Fahr. Shade them from all strong sunlight, and never allow them to suffer from dryness at the roots. An important factor in the raising and growing of orchid seedlings is cleanliness.—The Garden.

### SPRAY EVERY YEAR FOR PERFECT FRUIT.

Spraying is done by the average fruit grower for but one purpose,—that of preventing injury to the fruit, whereas there is a secondary reason for spraying, which escapes ordinary observation. This second reason is for the purpose of maintaining healthy foliage on the trees, without which the tree dies. Spraying really has for its object the production of fruit which is free from damage by fungi and insects, and for the protection of the leaves from damage by the same agencies that destroy the fruit.

Healthy leaves on trees are of as much importance as healthy roots. They are organs which are essential to the life and fruitfulness of a tree, and are comparable to the stomach and lungs of animals. The roots do only half the work of nourishing a tree, and the leaves perform the other half. The roots supply the soil moisture with the mineral salts which are dissolved in it, while the leaves gather the carbon and oxygen which enter into the various compounds making up all

parts of the plant.

To perform their functions properly, leaves must be healthy, and must be exposed to the sunlight, for if they are not they will turn yellow and drop off. Leafy plants which are grown in a dark place sicken and die, because light is essential to the maintenance of their vital functions. They are unable to digest, or to assimilate the gases of the air and the juices which are supplied by the roots, unless exposed to sunlight.

If the leaf of a plant is examined closely, such as an apple or plum leaf, or of an onion, lily, or any other green plant, there will be found on the upper and lower surfaces a thin skin which can be torn off, leaving a spongy, green substance. This spongy matter gets its green color from a material called "chlorophyll," and it is upon this chlorophyll that the activity of the leaf depends. Under the influence of sunlight it collects a gas from the air which is combined with the moisture supplied by the roots and starch is made. This is stored in the leaves temporarily in a form identical with commercial starch.

But starch is insoluble in the sap of the plants or in cold water, and is of little use to the plant while it remains in that form. However, in the mystery of the leaf, by an obscure process, the starch is changed into another very common substance which is very soluble, and which is nothing more than a form of sugar. As soon as this change takes place the starch, which is, the real food substance of the plant, can be transported to the fruit, branches, leaves and roots and then by other processes be converted into other substances. In this way, then, the leaves of a tree act in essentially the same manner as the stomach of an animal, for the reason that it is here the food material which goes to supply the various tissues is digested and made over into substances which can be used.

But leaves also act in a similar manner as the lungs of an animal, that is they take in oxygen from the air and give off a gas called "carbon dioxide." This is exactly what is done by the lungs of an animal, but this process goes on very slowly in the leaves. This exchange of gases takes place through very minute holes in the skin covering the leaves, and when these holes become choked up, or the channels in the leaves through which the gases and fluids pass, become broken or in any manner interrupted, then the function of the leaf does not take place normally, and it soon dies.

This is what happens when leaves are badly mutilated by insects or invaded by the threads of various

fungi. Spray materials frequently damage the tender tissues of leaves to such an extent that they cannot properly perform their function, with the result that they drop. Everyone is familiar with this condition who has ever tried spraying peach or plum trees with strong bordeaux mixture. Then, too, most every one who grows tree fruit knows how the leaves will frequently fall from the trees about the time the fruit is beginning to ripen, because of attacks of leaf destroying fungi.

In this case the channels in the leaves through which the sap circulates either becomes so plugged with the fungous threads that there can be no passage to or from the crude and elaborated sap, or else the food material in the leaves is consumed by the fungous

parasite.

This early defoliation of trees is of such a common occurrence that many fruit growers have almost come to take it as a matter of course, and fail to associate with it any ill consequences. However, as soon as the leaves are shed, the tree becomes dormant, and cannot store up within its buds, branches and roots, the food material on which it must depend for its early growth the following year, and the development of its fruit

сгор.

A tree which drops its foliage, even half its leaves, before the fruit is gathered or before the arrival of the first frost is more or less weakened, and is not in the best of condition for the next year. Trees which are well sprayed throughout the summer and on which the foliage is maintained in healthy condition by spraying, can not only produce finer fruit, but make strong, vigorous fruit buds as well for the next season's crop. One of the things which goes a long way toward having annual crops of apples is the maintenance of healthy foliage which will remain on the tree bright and green until killed by frost.

It is as much of a crime to let the foliage on a tree drop abnormally early through the agency of fungi or insects, as it is to produce wormy or fungous infested fruit. Keeping the trees healthy in foliage by spraying is just as important as is the production of perfect fruit. The tree is not only then able to make more fruit buds for the next year, but it has the opportunity to store up in its tissues food materials which make it stronger and more vigorous and fruitful the

next year.

The man who fails to spray his trees in years when the frost destroys his crop is only half converted to the value of spraying, for he is allowing the foliage of his trees to become the prey of various pests and its effects will surely be felt directly or indirectly the following year. The secret of getting eighteen crops of apples in twenty years lies as much in maintaining healthy foliage on the trees as in any other orchard practice. —Fruit Grower.

# The Service Bureau National Association of Gardeners

Is maintained for the purpose of providing opportunities for efficient and ambitious men engaged in the profession of gardening. This department of the Association is at the disposal of those who may require the services of capable superintendents, gardeners or assistant gardeners. Address

## **QUERIES** and ANSWERS

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.
Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

uiter. Nothing will tend to better fellowship than helping each other. Take advantage of this "Question B a."

Will you tell me if anything can be done to the bulbs of the Gardenia flowered Narcissus to make them bloom? I have several hundred bulbs which throw up one or two buds each, but I have had but three or four blossoms this year. The buds dry up and nothing happens. They have been moved to various parts of the garden where they have been tried in sun, shade, rich and poor soil, sand, clay, etc. But the result is always the same. A farmer's wife not far from here has a clump of them growing in the grass, uncared for, which yields an enormous crop every year. I tried to do the same with the result that they prompt-

Regarding inquiry as to the trouble with Narcissus: Its native home is in the grass, where it will flourish if undisturbed, for many years. It is not particular as to what kind of soil it grows in, but cow manure is the best fertilizer for it. To grow them successfully, they should be placed three inches deep, because the bulbs raise annually. Do not disturb them the first year, as it usually takes two years to mature a flowering bulb. After it has had its growth it must not be tampered with, but be allowed to gradually die down undisturbed, as the bulb is fed with the decayed parts of the flowering stems and foliage. Too frequent removal of these bulbs is a hindrance to successful flowering. I would suggest planting them in the open grass, where they will get plenty of sun and where they should show marked improvement in two years' time.-W. R. F.

What is the cause of the blight of the flowers of the English Broad Windsor bean, and is there a remedy? -L. N. G.

The English Broad Windsor beans are not successfully grown in this part of the country. Attempts in New Jersey, New York and Massachusetts to secure a good crop have always met with failure with me. The cause of the blight is probably the same as that which is doing so much damage to the bean crop generally, and authorities who have investigated say that the trouble originates with the seed, and that special care must be exercised to obtain seed free from the blight and the disease commonly known as anthracnose. The English Broad Windsor is also very susceptible to insect attacks, especially the black aphis. but this, of course, is easily combatted with the proper insecticides. I have met with most success by feeding lots of water to the roots as a strong growth is necessary.—E. D.

I would like to ask some of your readers which varieties of trained peach trees are the best to grow on walls outside; also can nectarines be grown that way and finished good? Are the English varieties of peaches and nectarines, the same as we force in the greenhouse, all right for that purpose?—H.

Will some of our readers who have had experience please answer?-Editor.

A very interesting discussion arose concerning the caterpillars that are destroying the oaks and hickory in this section and it was unanimously voted that the society do all in their power to combat the same.

It was also agreed to use the scale of points in the forthcoming shows.

FRED KIRKHAM, Secy.

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

The monthly meeting of the Nassau County Horticultural Society was, held Wednesday, June 10, at Pembroke Hall, Glen Cove, President H. Gaut in the chair. Messrs, Chas. Parr and Henry Wenzel, both of Glen Cove, were elected to active membership, and there were two petitions for membership received. Mrs. W. H. Porter, Glen Cove, was elected as an honorary member. Special prizes for the society's shows were received from A. G. Hodenpyle, Esq. Locust Valley, and Hitchings & Co., Elizabeth, N. J. John Scheppers & Co. donated \$50 as a special prize for Darwin Tulips for next spring. Judges for the monthly ex hibits: S. J. Trepess, J. Adler and W. Hutton. Awards were made as follows:

12 H. P. Roses, 1 variety, F. Honeyman

12 largest strawberries, Hy. Jones first, 12 mixed Peonies, Hy. Jones first.

Honorable mention was awarded to the following:

H. Gaut, for 3 vases Sweet Peas.

H. Boettcher for 1 vase mixed Sweet

H. Boettcher for vase Aquilegia Chrysanta.

W. Gray for bunch asparagus.

Certificate of culture, John Scheppers & collection of Peonies.

Mr. James Duthie, Oyster Bay, who is a past master in the art of Dahlia culture. gave an interesting and instructive essay on Dahlias for exhibition, cutting for the house and garden decoration, which was very much enjoyed by all present. At the close Mr. Duthie was given a very hearty

Exhibits for next meeting, Wednesday, July 8, Sweet Pea night, 12 pink, 12 white and 12 any other color

HARRY JONES, Corresponding Secretary.

# HORTICULTURAL SOCIETY.

There was a fine attendance of members present at the regular monthly meeting of the Westchester and Fairfield Horticultural Society at their rooms in Doran's Hall. Devine received the society's prize for a fine Greenwich, Conn., Friday evening, June 12.

Duthie first for pot of Calceolaria, and meeting to order promptly at 8 o'clock. Two new members were elected and several propositions for membership were received. Several letters were read from friends of the society offering substantial additions to the premium lists of both summer and fall shows to be held by the society. The Exhibition Committee reported everything in readiness for the summer show to be held on the hospital grounds at Portchester, N. Y., June 19 and 20. An attractive schedule has been issued. and we trust that there will be a large display of flowers, fruits and vegetables. The Fall Show Committee reported progress.

Mr. M. C. Ebel, secretary of the National Association of Gardeners, was present, and came prepared to discuss the co-operative movement now in preparation between the local societies and the national body, and explain any features of the movement of which the members of our society were not conversant.

Mr. Ebel read the report of the proceedings of the meeting recently held by the Co-operative Committee of the National Association and added his personal plea for the support of the Westchester and Fairfield Society urged the members present to consider the question carefully. able interest was manifested in the speaker's remarks, and after a lively discussion it was unanimously decided that the Westchester and Fairfield Society would support any movement tending to the advancement of horticulture and of the gardening fraternity. The president accordingly appointed a committee of three members who will endeavor to look after local conditions and work in conjunction with the Co-operative Committee of the N. A. G. It is not to be expected that this movement is to be a

Wm. Warner Harper, Proprietor Box O, Chestnut Hill, Philadelphia, Pa.

"cure all" for everything affecting the con-{and also Mr. Baeran, of the Sanders Estate, } dition of the gardener-the fixing of wages, hours, etc. and should not be confounded with the labor unionism which obtains with more or less success in the building trades and other lines. We feel that the question of wages, etc., on private estates will always remain a matter for personal adjustment between the gardener and his employer, governed entirely by the requirements of the position and the qualifications of the gardener. The advancement of horti-culture in America is not a passing fancy, but is growing every year to greater pro-portions. Perhaps the co-operative movement may not benefit the profession immediately, but surely will in the near future. The nature studies in the public schools, special courses in the colleges, the widespread garden club movement, are all important factors, and we think that the sun has surely set on the day of the horse and cow variety of gardener and the handy man type, who are now in charge of what should be good positions. The education of the public will relegate these "land-scape destroyers" to their proper positions. and the men with the intelligence required of the successful gardener and conscientious worker in horticulture will occupy the positions of trust with a good salary and not be in danger of being classed as a common laborer when he refers to himself as a gardener. It looks very rosy in print, "boys," but we do not think it impossible.

An attractive feature of this meeting was the competition open to assistant gardeners only for the silver first prize and bronze second prize medals offered by the H. F. Michell Company of Philadelphia, Pa., for the best arranged centerpiece for a dinner table composed of outdoor flowers and foliage to be arranged in the hall. There were four contestants, and the result was four very neat, tasteful and artistic arrangevery neat, tasteful and artistic arrange-ments. The first prize was awarded to David B. Ridpath, assistant to James Stuart, Mamaroneck, N. Y.; second prize awarded to Andrew P. Clarkson, who is with Alex. Marshall, Portchester, N. Y. Neil MacInnes, of Mamaroneck, and Adam Smith, of Rye, N. Y., were each accorded a hearty vote of thanks. The usual nonhearty vote of thanks. The usual noncompetitive exhibits were not so numerous at this meeting, but were of fine quality. Alex. Marshall was awarded a cultural cer tificate for a splendid specimen plant of Miltonia Vexillaria; the same for a fine spray of Cattleya Mendeli. Thomas Aitcheson was highly commended for a fine specimen plant of Oncidium Wentworthiannum. P. W. Popp was awarded a vote of thanks for a vase of hardy roses, climbing American Beauty, novelty of recent introduction. This variety makes a good pillar rose, and is a clean grower. Will become popular when better known. Next meeting will be July 10, 1914.

P. W. POPP.

#### NEW LONDON HORTICULTURAL SOCIETY.

The regular monthly meeting of the New London Horticultural Society was held in its rooms in Main street, Thursday, June 11. President Fuller presided. After the usual business ceremony President Fuller introduced Miss Amy Cogswell, of Norwich, who gave a most interesting essay on the early gardens of New England, also touching upon English gardens of the Stuart and Cromwell periods. The lecturer was given a rising vote of thanks. Messrs. Jordan, Flowers, Baeran, Smith and Maloney made up some fine exhibits. Sweet peas from open gardens were shown by Mr. Flowers

John Maloney, gardener to the Guthrie Estate, had arranged an exquisite vase of Iris. ete Stanley Jordan showed snapdragon "Ramsburg Pink," also the sweet-scented Lilian Monadelphum from the Hardy gar-

The schedule for 1914 is now ready and may be obtained from the secretary. John Humpbrey. STANLEY JORDAN.

#### TUXEDO HORTICULTURAL SOCIETY.

The monthly meeting of the Tuxedo Horticultural Society was held in the Parish House on June 3, President David McIntosh in the chair.

The secretary of the Ball Committee gave his report, the ball being a great financial success and one of the finest the society has

A letter from the National Association of Gardeners was read asking us to appoint a committee of three to work in cooperation with the co-operative committee of the N. A. G. Messrs, Tansey, Millar and T. Wilson were appointed on that committee. The Executive Committee has had the preliminary schedule printed, and any who wishes a copy can have same by applying to the secretary.

The Fall Show which is to be held in the Tuxedo clubhouse on October 30 and 31 and November 1, is shaping to be one of the finest the society has ever held.

We had with us Mr. J. A. Muller, of Julus Rochrs Company, who read a very instructive paper on the culture of Orchids. Mr. Muller had with him some very blooms of the rare varieties of Cattleyas, Miltonias, Odontoglossums and Oncidiums, and showed many of the others on photographs. The paper was thoroughly enjoyed by all those present, as Mr. Muller certainly did his subject justice.

Three new members were elected to membership-Thomas Knight, Alexander Roy

and Harry Watson.

An exhibit of twelve spikes of Eremurus Himaliacus was staged by Mr. Emile Barth. which the judges awarded a certificate of culture. The society will discontinue their monthly meetings during July and August.
THOS. WILSON, Secretary.

#### TARRYTOWN HORTICULTURAL SOCIETY.

A regular monthly meeting of the Tarrytown Horticultural Society was held May 20. President Elliott presiding. A beautiful display of flowers cut from hardy shrubs and herbaceous was staged. Judges Mooney and Featherstone awarded first prize to Mr. D. G. L. Reid (A. Golding, superintendent), and second prize to Miss B. Potter (G. Wittlinger, superintendent) A cultural certificate was awarded to Mr D. G. L. Reid (T. Morris, gardener) for a vase of Mrs. Hugh Dickson's sweet peas, and one to Mr. W. B. Thompson (S. R. superintendent), for a plant of Candler. cattleya jigos, and a certificate of merit for new Marguerite sport of Mrs. Saunders. Mrs. C. Wilson received honorable mention for a vase of pink snapdragons, and a vote of thanks was extended to Mr. A. Golding for a bouquet of wild flowers and a vase of wild eyprediums. Several new members wind cyprediums. Devital has a server were admitted to membership at this meeting.

THOS. A. LEE,

Rep. Secly.

#### LIBRARY LIKE ROSE GARDEN

Marked success crowned the annual rose exhibition at the Public Library, Rahway, N. J., recently, the largest number and most beautiful specimens yet shown being in evidence. All parts of the city were represented by the exhibitors. Among the largest and most attractive collections were those of E. M. Squier and Miss Henrietta Dotzert, the former having fifty-five and the latter fifty-two varieties. The "Entende Cordele" variety shown by Miss Dotzert was one of the most unusual specimens ex-

Other exhibitors were as follows: Mrs. H. Kip Woodruff, sixteen varieties: Fred Garbonati, seventeen; Mrs. W. H. Cloke, nine; J. Malcolm Brookfield, ten; Miss Annie Shotwell, seven; Miss A. W. Lupton and Miss Helen Clarkson, six each; Mrs. J. A. MacClary, five; Mrs. John B. Labat, Avenel. eight; Joseph Urmston, twenty; Mrs. J. L. Brown, six; J. W. Saling, five; Mrs. William Ferrill, four; Miss Eizzie Garthwaite, two; R. H. Rolph, one; Mrs. Haas, one; also a large collection of poppies and sweet William; Mrs. Edward S. Savage, collection of Spanish Iris.-Journal.

#### LENOX HORTICULTURAL SOCIETY.

The regular monthly meeting of the Lenox Horticultural Society was held in the Town Hall, Lenox, on Saturday evening, June 6. President McConnachie occupied the chair, and there was a good turnout of the members. Mr. E. Edwards was elected a member. A committee of three were appointed to co-operate with the National Association of Gardeners, namely, Mr. A. J. Loveless, Mr. E. Jenkins, Mr. S. W. Carlquist. Mr. Thomas Proctor was awarded a certificate of merit for Clarkia (Queen Mary) and a diploma for Clarkia (Salmon Queen). President McConnachie then introduced Mr. Burton N. Gates, assistant professor in bee keeping at Massachusetts Agricultural College, who gave a very interesting lecture entitled "More Bees for Massachusetts." Mr. Gates said bee keepmg was the oldest art under the sun, and was first introduced into America through the port of Boston in 1634. The speaker also mentioned how valuable bees were to the fruit grower for fertilization of various fruits such as melons, cranberries, etc. To keep bees through the long severe winter used to be very trying to the bee keeper. but by using modern methods all the difficulties have been overcome. He also said that the best type of bee is the Italian bee. Various questions were asked Mr. Gates after the lecture which he seemed only too pleased to answer, and at the finish he was accorded a rising vote of thanks

## NOW READY FOR SHIPMENT

Most dealers recommend planting Strawberries in August. However, we hope you will see the advisability of setting pot-grown plants as early in July as possible and believe if you follow our advice the results will be much more satisfactory.

Our list includes all the newest and best standard varieties, extra strong, healthy plants. We exercise the utmost care in packing for shipment, which is of great importance to the purchaser. Place your orders early.

#### THE GARDENERS' CHRONICLE OF AMERICA.

THERE is a lot of "b the " about greenh ascornstructions. Yes, a lot of it!

So anxious are the building concerns to be considered leaders in things new—that they are often lead to take some little unimportant improvement to their construction and exploit it as if it was going to revolutionize the entire greenhouse building code.

Only the other day I read an ad, of a concern who made the astounding statement that they had made a tremendous improvement in greenhouse construction by abandoning for all times the clamp column fittings and adopting a "bolted through" one. It was exploited as a great discovery and something entirely new. As a matter of fact it has been used by another concern for at least thirty years

for at least thirty years.

Talk all you will about various improvements in private greenhouse construction, but when you get right

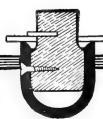

down to brass tacks, there has been no really important development since the introduction of the U-Bar. No one denies that. Ever since then (in spite of all the stones thrown at it) all builders have promptly adopted as far as possible U-Bar structural features. The curved eave and 24-inch glass, just for example. But putting a curved eave on a house does not make it a U-Bar curved eave house. There is only one U-Bar curved eave house, and that's the house made with the U-Bar. Other curved eaves may look like it, but that's the only way they are like it.

# Electricity and Plant Culture

By Arthur Smith.

Of all the natural forces the most fertile in its subserviency to the necessities and luxuries of man is undoubtedly electricity. No degree of familiarity, however long continues, can efface the sense of wonder at the effects of the many applications to which this mysterious force can be put. Whether the mystery surrounding the chemical character of electricity will ever be solved or not is an open question. It is possible that in the future the elements, if there are any, which enter into its composition, may be stated in chemical terms, but at the same time it is rather doubtful. Whether electricity be a simple or compound substance is, however, not of great practical importance, at any rate so far as this article is concerned. It will therefore be unnecessary to consider the technology of electricity, merely stating that it is universally present in nature in a more or less latent state—in a state of quiescence and equilibrium—but this state is one which is very easily disturbed and it appears that however great the quantity of electricity a body may contain it is ineffective unless transformed into a current. It may be assumed that frictional, voltaic and animal electricity are one and the same thing, the distinction merely being in the mode of generation.

The very general distribution of electricity throughout almost every substance, and the state of activity it displays around growing vegetation, has led at various times to the belief that were means devised to divert a more than usual quantity of it through plants, their growth could be much accelerated.

At present it is impossible to define to what extent the growth and development of living organisms depend upon electricity, but we know at least that it is more or less beneficial. The fact has been definitely established that electric currents exist in the soil and in the plant; in reality wherever chemical activity occurs electric currents are likely to be present, although these currents may be comparatively insignificant and require very delicate instruments for their detection.

Probably many have noticed that rain accompanied with a discharge of electricity through the atmosphere has a far greater beneficial effect upon growing plants, grass for instance, than a similar amount of rain under like circumstances, but without the electricity. The reason of this is that the form of electrical discharge known as lightening produces nitric acid and ammonia by causing their elements to combine in the atmosphere; the rain which generally accompanies it brings these valuable plant-foods down to the soil. This power of electricity is now being made use of in the manufacture of nitrates for commercial purposes to take the place of nitrate of

soda. From this it is easily understood that a current of electricity passing through the soil will have a similar effect in causing the combination of the elements contained in the above plant-foods and thus rendering them available.

The idea of using electricity in an artificial way for this purpose has frequently occurred, as it has long been known that plants respond to electrical stimulus, and many investigations have been made with a view of ascertaining practical means of realizing the benefits of this force.

The first record which we have of any experiments in electro-culture is of one made by Dr. Mainbray, of Edinburgh, in 1747, who passed the electric current through plants in pots. In 1840 a lady, whose name has not been handed down, conducted some experiments which mainly consisted in causing a constant flow of frictional electricity through a portion of the ground in her garden, with the effect that vegetation did not cease during the winter upon the plot under the influence of electricity, and that what snow fell upon it during the continuance of the experiment never remained as it did upon the rest of the garden around. This result caused Dr. Forster, of Elginshire, Scotland, to place a small galvanic battery in action upon a grass plot, and the effect produced fully confirmed the results of the lady's experiment. This and the results of further experiments by Dr. Forster led him to try the effect of collecting the free electricity of the atmosphere by means of wires suspended upon poles thirteen feet from the ground, and conveying it through it through the soil by means of buried wires. The result upon a plot of twenty-five square rods, part of a field of barley, was that the electrified plot produced more than double per acre than the rest of the field. A full account of this experiment appeared in the Times (London) of October 2, 1844. One of the reviews in a leading article at the time used the expression, "He turns the materials of the thunderbolt to manure.'

Although these experiments were successful, as far as they went, as proving the beneficial action of electricity upon plant growth, yet the question remained in abeyance for nearly fifty years. About the year 1890 Monsieur Baral, of Garonne, France, applied electricity to the culture of potatoes, tomatoes and hemp. A row of hemp, subject to the influence of the electric current, grew eighteen inches taller than the rows not electrified. A kilogramme (2.2 pound) of potatoes planted in the path of the current produced 21 kilogrammes of very large, healthy tubers, while the unelectrified patch only gave 12½ kilogrammes from the same weight of seed.

The electrified tomatoes ripened their fruit eight days before the others. Another French experimentalist, Abbe Nollet, appears to have been the first to prove that the application of electricity to seeds hastens their germination. The value of the electric light in hastening the blossoming period of plants was first brought into notice by the late Sir William Siemans, who used it with great success upon flowering plants and fruit in his own greenhouses.

The subject therefore naturally divides itself into the direct use of the current applied to the soil in which the plant is growing, and the use of the electric light as a substitute for the sun in cloudy weather or at night. Experiments along both these lines have at a comparatively recent date been carried out by the Massachusetts and other agricultural experimental stations in this country.

In these experiments it was found that electricity exerts an appreciable influence upon the germination of seeds, and 55 per cent. more germinated in forty-eight hours than those not subject to the current, this being the average of five species; but it was found that the application of electricity does not increase to any appreciable extent the total germination, nor does it, as some have claimed it does, awaken to life seeds which have lost their vitality. The experiments with the direct application of electricity to plants in growth were all successful in raising larger crops, and in the case of tomatoes they ripened earlier. The following shows the effect of various electric currents upon the growth of radishes. The duration of this experiment, which was carried out at the Massachusetts station, was thirty-nine days.

Treatment. Total per cent. gained.

Direct current; one cell; copper-plate electrodes. 74.07

Direct current; one cell; wire electrodes. 23.15

Atmospheric electricity; copper-plate electrodes. 53.61

Copper and zinc-plate electrodes connected. 182.38

Interrupted induced current; copper-plate elec-

Unelectrified plants were taken as the standard in calculating percentages.

The atmospheric electricity was obtained by means of a pole extending thirty-five feet above the ground, on the top of which was projected twenty-four small copper points distributed in two circles, the outer one having a radius of thirty inches. The copper points were all connected with a single copper wire leading to one of the copper-plate electrodes, the other electrode being grounded. The strength of the currents used in this experiment upon radishes varied from .05 to 1 milliampere.

A series of similar experiments were also carried on with lettuce, giving the following results:

Average Number current Total Treatment. of in milliper cent. plants. amperes. gained. 94 22.78 Direct current (weak)... 0.184Direct current (stronger). 0.367 40.76 46 36.48 Copper and zinc plates... 48 0.214 Atmospheric electricity ... 47 not taken 39.22

Among the remarks accompanying the report of these experiments it was stated, "The effect which electricity has in accelerating the germinating of seeds and the growth of plants is positive, and in hundreds of experiments conducted in different manners we have seldom obtained any negative results. We have, moreover, conclusively proved that the alternating current is much superior to the direct as a stimulator.

"The question naturally arises, in what manner does electricity stumulate plants, or, in other words, how are

accelerated growth and accelerated germination to be explained? There are numerous agencies which act as stimuli to seeds and plants about which little is known as to how they stimulate.

"Some of the theories pertaining to electrical action, however, possess interest and are worthy of being mentioned. Frecke held the idea that electricity was the great moving force of animate creation, and identical with nervous influence. Marat was of the opinion that electricity exerted a marked influence upon soil fertility. The action of electricity upon oxygen, as is well known, gives rise to ozone, and some botanists have believed that the production of ozone in the seed is the prime factor in accelerating germination and growth."

For the greater part of two centuries, therefore, electro-culture has been the subject of experiment and always with more or less successful results. During the past year the question has again been pushed to the front by the experiments which have been carried out in France, upon which an interesting article appeared in the Larouse Mensuel (Paris) for March, 1914.

The writer describes an apparatus called a geomagnetifier, an invention of Lieutenant Basty, which is formed of a metal rod terminating at a point composed of an alloy which is both a good conductor and nonoxydizable. The length of the rod varies, according to the plants cultivated, from one to two yards, and the end is buried in the ground to a depth equal to that normally attained by the roots. The results announced are very encouraging and confirms those obtained by previous experimentors, in obtaining a shorter period of germination, reduction in the time of reaching maturity and a much larger yield than under ordinary conditions. Thus, spinach sown March 21 and subject to the action of the geomagnetifier, germinated March 31, was gathered May 15, and gave a much better yield. Other plants from the same sowing not electrified did not germinate until April 8, and were not ready to gather until nearly in June, while the yield was only a quarter as much. In the case of strawberries the fruit ripened earlier and was larger in size.

Of course, this apparatus although given the above high sounding name differs nothing in principle from the means used in the eighteenth century and many times since by experimenters for the purpose of collecting atmospheric electricity. One point which these latest experiments have brought out which is entirely new is that plants were rendered immune from diseases due to micro-organisms. In the case of potatoes while diseased tubers were prevalent in field, a portion electrified contained scarcely any. A plot of beets was artificially infected with what is called in the article "a serious and injurious contagious disease," the name, however, not being given, and the electrified portion received no dam-In the case of potatoes the non-treated part contained a considerable greater number of diseased tubers. This bears out the claims made some fifteen years ago by the promoters of a system for electrically treating sewage that by running the sewage over metal plates charged with high voltage electricity, typhoid and other disease germs were absolutely destroyed and the effluent could with safety be then discharged into a stream. The expense of this process was, however, too great too secure its adoption.

The Journal of the Board of Agriculture (England), Vol. XX., contains a report of some experiments with potatoes at Dumfries, Scotland, during 1912, which fully confirms the benefits of electricity in plant growth.

While there is without a shadow of doubt a fundamental basis for the theory that electricity is capable of decomposing certain plant foods existing in the soil and

thus rendering them more available, and, also, as noted above, of causing the combination of the elements of nitric acid, yet at the present moment it does not appear possible for any one to define with certainty how and why electricity has a beneficient action upon growing plants. But as it has been proved that electricity affects the protoplasm of the plant, there is no doubt that it is to the effect upon the protoplasm that we must probably look for the solution of the problem. The effect can be seen in plants that show protoplasmic movements, such as, for instance, the Chara, one of the families of the Cryptogameous plants having no vascular tissue, by which it has long been known that weak currents stimulate protoplasm and induce accelerated movement; whereas strong currents retard or stop such movements, and if too stong, the protoplasm is killed.

There is a good deal of interesting data being accumulated concerning electrical influence upon plant growth, but the question cannot be said to be yet out of the experimental stage, although the advantages derived from the direct application of electricity to vegetation

are unquestionable.

The writer in the French magazine above mentioned concludes his article by expressing amazement that in view of the remarkable results produced, farmers and gardeners do not universally adopt this treatment for their crops, and he attributes their failure to do so purely

to ignorance.

While there is no disputing the fact that the use of electricity upon growing crops will produce beneficial effects in more than one direction, the universal adoption of its use depends entirely upon its practicability, whether the resulting increased crops will pay for the increased expense. It is obvious for one thing that the ordinary operation connected with cultivation and harvesting would be greatly interfered with and rendered more expensive in the case of a field studded by poles and wires. In a garden where all operations are by hand, the inconvenience would not be of any moment. In the latter case the question to be answered by experiment is whether the results will compensate for the trouble in erecting the apparatus irrespective of cost, also whether if this increased cost were put into extra plant food, equal results would be produced without the attendant trouble of fixing the poles and wires.

It must be understood that electricity supplies no plant food, its effect appears to be in enabling a plant to make

greater use of the food within its reach.

The use of electric light in connection with plant growth is in a far more advanced position. Its effect has been investigated at, amongst other places, the agricultural experimental stations of Concord, Miss., and West Virginia, the arc light being used at the former, and the incandescent at the latter.

In the case of plants being grown under the influence of this light, the effect seems to be produced through the hastening and prolonging the act of food assimilation owing to the extention of, what practically amounts to, the hours of sunlight, and the substitution of the light for the sun in cloudy weather. A large number of species of vegetables, flowering and foliage plants have been experimented upon. In the experiments with the arc light it was soon found that the naked light exerted an injurious influence upon many plants. This is believed to be due to the presence of the ultra-violet rays, the spectrum of the electric light being unlike that of sunlight. A glass screen or ordinary globe was found to cut out the injurious rays and to allow the beneficial rays to pass through. By the use of the light the flowering period of many species of plants was hastened, Easter lilies being advanced as much as ten days. With vegetables the best results were obtained upon lettuce, plants of which were a week or more in advance of those in the unlighted house. The results with the use of the incandescent light were to a great extent similar, but the balance of evidence is in favor of the arc light.

The practical utilization of the electric light upon a commercial basis is now an accomplished fact so far as lettuce is concerned. In the New England lettuce houses, especially in the neighborhood of Boston, a gain of time is obtained during the winter season sufficient to enable one more crop of lettuce to be grown in the same time than where the light is not used.

In the case of flowers the use of the light has not been found to be commercially profitable, although the flowering period was considerably hastened. In this connection it does not do to use the light too early in the life of the plant, or flowers will appear before the plant is strong enough to grow them to their proper size.

Up to the present there have not been, so far as we are aware, any experiments made of the use of this light in the open air and one would not venture to foretell what

possibilities may exist in this direction.

So far as the use of electricity itself to plant growth is concerned it cannot be denied that there is evidence enough to support a belief that in time to come it will occupy as important a place in agriculture and horticulture as it does today in other directions.

#### PROPAGATING THE AUCUBA.

If there is one evergreen shrub more prominent than others as particularly adapted for cultivation in confined town and suburban gardens, it is the Aucuba. A native of Japan, A. japonica in growth, size and color of the leaves is a very variable shrub. The numerous forms of Aucuba have been given varietal names by nurserymen, and it would not be difficult, should one wish it, to obtain a collection of at least twenty named sorts. In habit the plants vary from 2 feet to 10 feet in height. There is a very marked difference in the size and coloring of the leaves. Some growers prefer the large, shiny pale green leaves beautifully spotted with yellow; others choose the rich, shiny green leaves, suggestive of the Laurel. In some sorts the edges of the leaves are entire, while in others they are elegantly toothed.

Shade does not harm the Aucuba; it will thrive under tall trees as well as the Ivy. Such a good-natured plant is the Aucuba that, in addition to thriving in most positions, it will also grow in nearly all soils. The Aucuba makes a beautiful and attractive lawn specimen; it is also useful as a screen, and an ideal subject for the shrubbery border.

This Japanese shrub is also interesting, there being two sexes. The male and female flowers are borne on different plants, not like most of our favorite shrubs, both on the same plant. In addition to its attractive foliage, the female Aucuba bears ornamental red berries larger than those of the Holly; but to get these one must grow Aucubas of both sexes, as the pollen from the flowers of the male plant is necessary to fertilize those of the femal?

otherwise no berries are produced.

Propagation from cuttings is the usual and quickest means of increase. Quite large branches root readily in a close propagating frame, preferably with a little bottom heat. Under glass, Aucuba cuttings may be inserted at any time. In the open border October and November is the best time to put in cuttings. In a moist propagating frame the cuttings will root in any light material-sandy soil, fibre, leaf-mould or coarse sand. By inserting large shoots such good plants are available for potting up in two months suitable for use at once in a window box.—Exchange.

#### WHEN TO PRUNE SHRUBBERY.

Much may be added to the beauty and attractiveness if the shrubs about the lawns and gardens are kept in a thriving condition. This may be done, or at least their beauty may be greatly enhanced, by judicious and timely pruning. It requires but little time, if the work is done every year, to keep the bushes growing and developing in a uniform manner; while if allowed to grow without attention for a few years, it may take a number of years of careful pruning to bring them into shape again.

When a shrub is set is the time to shape it, to a certain extent. If it is properly pruned at that time, subsequent cutting and shaping will be reduced to a minimum. The grace and beauty of most shrubs lie in their drooping habit. Nature, in the main, will attend to this. Sometimes, however, certain shapes or designs may be desired. While this is something for a skillful gardener to attend to, yet certain work along this line can be done by the careful amateur. The correct methods to be pursued with a general collection will have to be learned

largely by observation.

It is, of course, true that work like the removal of dead limbs, branches that chafe or are badly crossed and superfluous interior shoots, may be done at almost any time of the year. The general pruning should, however, be determined by the time of flowering. In this respect our common shrubs are divided into two classes. The spring-bloomers, such as lilac, most of the spireas, snowball and weigela form their buds in the late summer or early fall of the previous year, upon wood of that year's growth. It is evident that winter or spring pruning, therefore, would sacrifice some of the best branches and would also induce the growth of new shoots at a time when the energy of the shrub is needed to develop the flowers.

This class, as can readily be understood, should be pruned in summer after the blooming period is over. New wood will then be induced to start and make a vigorous growth for buds the next year. The blossoms are borne at the ends of terminal or lateral shoots, hence the pruning induces more laterals to sprout, resulting in a larger number of flowers. The amount to be cut varies with different sorts. At least take as much as would be

taken if all flowers were cut with long stems.

Some of the summer bloomers are rose, althea, hibiscus, hydrangea and tamarix. With these the flowers form on wood of the current year's growth. Pruning should be done at any time after the leaves fall and before the sap starts in the spring. None but the most hardy kinds should be severely cut back in the fall. With the tenderer sorts, such as some of the roses, pruning should be done in the spring after danger of severe cold is well past. As a rule the late bloomers may be pruned more than the early bloomers, as flowers are usually the object sought rather than abundant foliage. A vigorous growth in the early spring must be obtained and nothing but pruning will bring this about.

Roses should be pruned in the spring. Ordinarily a severe cutting is best, yet with certain strong-growing kinds too much pruning will induce the bush to "run to growth" rather than to the production of flowers. Note the condition of the canes and cut each one off a half inch above a strong bud pointing in the desired direction. It is usually best to save buds that point outward, as the shoot will continue in the direction the bud points.

On the average about two-thirds of the previous season's growth should be cut away. Weak growing varieties may be cut even more. The hybrids and teas will need more severe pruning than the hardy sort. With these, after the winter protection has been removed, cut

out all the dead and "winter-killed" canes, even if it be necessary to cut to the ground. It is a fact that the severe cutting back of roses will not result in so many flower's, but they will be larger and better. If still larger blooms are desired, cut off some of the buds as they begin to develop, leaving only the terminal buds to form flowers. If the hardy roses are desired to produce a profusion of bloom, milder treatment than that recommended above is necessary. When cut flowers are desired, the more severe pruning is best.

The climbing roses may be pruned down to the last season's growth each spring and the new shoots trained as desired. If there is plenty of room, however, very little pruning will be necessary. Simply cut out the dead wood and occasionally some of the older branches, and the ramblers will keep in good condition.—Exchange.

#### THE SOIL AND DISEASE.

That many diseases arise from soil conditions was formerly a widespread belief, and is still asserted by many authorities. A writer in The Medical Council (Philadelphia, June) asserts that this theory is outworn, and that the soil, except where abnormally infected, is a conserver of health, not a harborer of disease. The theories that malaria is due to soil conditions, he says, have utterly collapsed, and of the diseases once thought to originate in the soil, including "military fever," typhoid, vellow fever, and more recently pellagra, erysipelas, beriberi, dysentery, tuberculosis, tetanus, anthrax, ameboid dysentery, cholera infantum, and epidemic meningitis, it is now fairly certain that none is there present normally. The organisms of some may infest both soil and water, but these are only "carriers" in such cases, not generators. To quote:

"As medical science advances it is more than probable that the soil as a generator of disease will be dismissed from consideration. It is quite true that buried accumulations of filth may proliferate various organisms, but that normal soil does so except as is taught in agricultural books is not probable. The normal bacteria of the

soil are not pathogenic to man. .

"After going through much authoritative literature, we are unable to find many authenticated instances of pathogenic bacteria normally occurring in the soil. More and more is it being thought that tetanus bacilli largely come from the intestinal tracts of the domestic animals and do not proliferate in the soil, although the spores may long remain viable. . . . Practically the only bacillus of which distinct claims of pathogenic activity have been asserted, and which may proliferate in tropical soil, is the B. cloacæ. But recent study shows it to be merely a colon bacillus of cattle which resists the lethal action of sunlight, and thus is very slowly killed. . . .

"As a matter of fact, normal soil is a natural and beneficent bacteriological laboratory, various nitrifying bacteria promoting growth and others decomposing humus and organic matter, thus rendering it available as plant food. But when natural conditions are disturbed, the bacterial balance is also disturbed; and fungi, molds, algæ, and other organisms proliferate, to the detriment of man and animals. Note, it is not so much bacteria but other organisms which proliferate. Disturbed soil needs to be cultivated, and cultivated well. And yet the processes of artificial cultivation are often productive of vegetable forms of diminished resistance, as note the phylloxera disease of cultivated grapes, the various blights and the root growths so destructive of highly developed plant life. . . .

"The soil is a great conservator of health, not a menace; its life and death processes are among the most wonderful in nature. 'Back to the soil' needs to be a health slogan as well as an economic one. But what kind of soil? The best answer is that of modern scientific farming, which conserves the soil as well as man. Science was long a very artificial thing; but it is now being naturalized. And the encouraging thing is that science pays in efficiency and dollars and cents. Scientific farming is not only the most profitable, but it is one of the greatest conservators of public health.

"And yet how foolish some sanitarians are! One alleged scientist recently stated that he would as soon his children played with poison as with earth, as all of the pathogenic bacteria came from the soil. And another 'city builder' wishes that not one blade of grass be allowed to grow within the limits of the city. Children know better, and 'scientists' should.

"Let us get back to the soil and the sun! Let us cease contaminating the soil and the atmosphere, and sanitation will progress by leaps and bounds. Sanitarians are, perforce of circumstances, compelled to make insanitary conditions tolerable; but what a great work could be done were these unnecessary conditions removed and the sanitarian allowed to devote his attentions more to man in a proper environment! Man himself is the great problem, after all. This world is a place 'where every prospect pleases and only man is vile.' Too long have we blamed our troubles upon this good old earth that we have abused so sorely. Let us begin with ourselves and let the earth wag along as the Creator intended it should."—Digest.

#### THE SNAPDRAGON.

H. J. Moore.

The Snapdragon-Antirrhinum from anti, like, and rhin, a nose or snout. Few if any of our well known garden flowers are more satisfactory generally than the one in question. For filling beds or borders of any size it is useful and will furnish a beautiful display of bloom from July until the end of October. In color the flowers are so varied as to render possible the most beautiful schemes, and lasting so long, successfully bridge over the entire summer and autumn. For cutting the snapdragon is also useful, and being easily raised, flowers are at the command of young and old. Two very popular types of snapdragons are tall Antirrhinum majus, and the dwarf or Tom Thumb kinds—A. majus manum, these latter being but varieties of the former which is likewise the progenitor of most of our valuable garden forms. In addition to the foregoing there are many handsome species less known perhaps, but nevertheless excellent border or rock garden plants.

Being of perennial habit the snapdragon may be increased by cuttings as well as by seeds, and while it is generally increased by the latter method, by cuttings is the only certain way to increase many colors or varieties, September being the proper month for the operation.

Insert the cuttings in a bed of sand in a cold frame, water carefully and shade from sunlight. Keep the frame closed, ventilating only during the day when the temperature is high or when moisture condenses excessively on the plants and on the inner surfaces of the frame. When rooted transfer the plants to boxes or pot them off singly, and place them in a cool greenhouse until the spring. By propagating early in the spring good bedding plants may also be obtained from cuttings—bottom heat at this time being of course essential.

Plants of named and well established varieties should be raised from seed, the quickest and most satisfactory way being to sow them indoors during March or April, and after transplanting into flats, thence into four inch pots to place the plants into cold frames to harden off preparatory to bedding out. Those who have no facilities for raising the seedlings indoors may sow the seed outside as soon as the weather and soil conditions will permit. These plants will, of course, flower somewhat later than the foregoing, but will nevertheless afford a pleasing display. Magnificent border effects may be created by planting the tall growing kinds towards the rear and the dwarf ones along the front of the border. For this purpose, when purchasing seed, the heights of the plants should be carefully noted and indicated on the label bearing the name of the variety. The distance apart must be governed by the height of the plant, overcrowding being deleterious. Fifteen to eighteen inches may be regarded as approximately right. Seeds should be sown outdoors in patches very thinly, the seedlings being thinned out as desired.

The Antirrhinum is not solely a garden subject, for if sown in the greenhouse during any of the fall months and potted commensurately as it grows, excellent plants in full flower may be had during the late winter and all through spring, while for cutting purposes a bench filled with plants will amply repay the labor. It is customary for many florists to lift the plants from the garden ere they are injured by severe frosts, and after removing the old flower stems to plant them in benches for the winter's supply of flowers, a very economical practice, and therefore to be commended.—Canadian Florist.

#### THE OLD MAN.

Be kind to your daddy, O, gamboling youth; his feet are now sluggish and cold; intent on your pleasures, you don't see the truth, which is that your dad's growing old. Ah, once he could whip forty bushels of snakes, but now he is spavined and lame; his joints are all rusty and tortured with aches, and weary and worn is his frame. He toiled and he slaved like a government mule to see that his kids had a chance; he fed them and clothed them and sent them to school, rejoiced when he marked their advance. The landscape is moist with the billows of sweat he cheerfully shed as he toiled, to bring up his children and keep out of debt, and see that the home kettle boiled. He dressed in old duds that his Mary and Jake might bloom like the roses in June, and oft when you swallowed your porterhouse steak, your daddy was chewing a prune. And now that he's worn by his burden of care, just show you are worth all he did; look out for his comfort, and hand him his chair, and hang up his slicker and lid.-Walt Mason.

#### JUST AS OF OLD.

Just as of old, the moments come and go, The Spring with its flowers, and the Winter with its

The hours pass away, the seasons warm and cold, And Time runs along today just as of old.

But, ah! how we change as the years come on anew, The heart grows strange that once was fond and true, And dear friends part, while others pass away. And sadly sighs the weary heart, day after day.

But just as of old, the many stars appear, And greet us again as in some forgotten year, And flowers bloom anew and rivers ever flow. Just as they did in days of yore, long, long ago.

# GROWING INTEREST IN PUBLIC ROSE GARDENS.

The recent rose show held in Syracuse breaks all previous records for attendance, interest and merit of exhibit. Imagine over two hundred varieties of the queen of flowers skillfully staged. They made the spacious hall a bower of beauty and fragrance. Mr. Robert Pyle, vice-president of the American Rose Society, gave a beautifully illustrated address the first night of the show on "Famous Rose Gardens I Have Visited." Two successive years Mr. Pyle has delivered the annual address and acted as judge. Rev. Dr. Edmund M. Mills, the president of the society, is a Methodist, but a poll of the members would show the Methodists in a decided minority. People of all faiths are found in this society, which has in four years grown to have an active membership of nearly three hundred. Mr. James M. Gilbert, a prominent member of the First Church, took first honors in winning the silver medal offered by the American Rose Society for the best exhibit. Every village of any considerable size, except one, within thirty miles of Syracuse, has members in this organization. Through the inspiration of this society hundreds of new rose gardens have spring up, and many already in existence have been greatly enlarged and improved. Among the direct results of the work of the year Syracuse is to have a municipal rose garden, and Syracuse University is planning for a rose garden which will probably be located in front of the Carnegie University Library building .-Extract from Northern Christian Advocate, of New

#### THE SMITH MEMORIAL.

As the committee (appointed at the Chicago convention, with regard to the erection of a suitable memorial to the late William Robertson Smith in the National Capital) has been continuously at work, since appointment, and has decided that the monument should take a form useful as well as ornamental in the shape of a memorial building to the father of the S. A. F. charter.

The committee is very desirous of obtaining subscriptions. The chairman of the committee will be pleased to receive them, no matter how small, and will give proper receipt for the same and place it in bank at 4 per cent. interest until such time that the memorial can be erected or contract awarded. The committee has hopes of receiving some large subscriptions, but feels that the florists of the United States should show their interest first before the large contributions are called for.

The committee, therefore, asks that you now send in your subscriptions addressed to Mr. William F. Gude, Chairman, 1214 F. street, N. W., Washington, D. C., so that the memorial may take tangible form at the earliest possible date.

During the week just previous to Decoration Day, the lot and graves in beatutiful Rock Creek Cemetery, containing the bodies of Mr. and Mrs. William Robertson Smith, were nicely trimmed and planted through the courtesy of Mr. George W. Hess, superintendent of the United States Bontanic Gardens, under the direction of Mr. W. F. Gude, Washington representative of S. A. F. and O. H.

On top of both graves are planted some Wichuriana roses, as Mr. Smith had often expressed a desire of having memorial roses planted on his grave. At the head of each grave a nice specimen of Anthericum Variegatum Scotch heather is planted, and at the foot Colluna Vulgaris. Each grave is outlined with a border of nice plants of Anthericum Variegatum, Aphipogon Jaburan

Variegata. The whole makes a very effective setting and quite a contrast to the long neglected spot. No doubt the Memorial Committee, which met in Chicago in 1912, will do what they can to erect some suitable stone on this beautiful lot, which is located in one of the most notable cemeteries in the United States. Just a short distance from the Smith section is the world's famous St. Gauden's masterpiece, the Statute of Grief; also the quaint old Episcopal Church, the brick of which was brought from England more than a hundred years ago, and still used daily, stands but a short distance in front of this spot. Many of the notable families of the United States have mausoleums nearby.

#### From Washington Post.

William R. Smith, the late superintendent of the United States Botanic Garden, and "the dean of American horticulture," who died in 1912, lived again last night at a business session and lawn party given in honor of the Florists' Club of Washington and their guests by William F. Gude, at his home, 3900 New Hampshire avenue northwest. Nearly 500 guests, including many in official life, attended the gathering.

In tribute to Mr. Smith, who for 45 years was in the service of the United States Botanic Garden, and who was characterized as "one who had done more than any other to make Washington a 'city beautiful'," it was proposed to erect a memorial in this city to his memory. It was suggested that the memorial be in the form of a conservatory, adaptable to the meetings of local and national florists' societies, and designed as a school for young men, where they could learn the science of horticulture.

Richard Vincent, Jr., of White Marsh, Md., former president of the Society of American Florists, paid a tribute to Mr. Smith, in recalling him as one of the greatest authorities on Robert Burns that ever lived.

At a business session preceding the party, it was decided by the executive board of the Florists' Club of Washington to hold a flower show November 2 to 8 at the Masonic Temple, to contain exhibits from all over the country. It will be known as the Washington chrysanthemum show, under the auspices of the Florists' Club of Washington.

#### WHERE BRAINS ARE NEEDED.

"I claim it takes more brains to farm," said Ebenezer Brown,

"Than what it does to git ahead and make a splash in town:

Why, I know six or seven chaps from this here neighborhood

Who went away to cities, where they're busy makin' good.

"You take Chicago and New York—size up the big men there—

The lawyer, doctor, merchant and the multimillionaire —

You'll find they've all been farmer boys, or lived in towns, at least,

Where they could have a chance to learn the ways of bird and beast.

"Now take these city chaps who come to cultivate the

I don't mean millionaires who farm for fun, you understand—

But take the common city folks who try to farm, and say!

It's pitiful the way they try to make their farmin' pay.

"I've saw a dozen of 'em fail; I never seen one yet Who managed to be prominent or not get into debt; And so I claim a man may make an awful splash in town

And not have brains enough to farm," said Ebenezer Brown.

—S. E. Kiser.

# The Sweet Pea of the Past and of the Future

In surveying the development of the sweet pea since it was first introduced into England, one must marvel at the extraordinary development of the flower and the position it occupies in the gardens of the world today. It has not only provided beauty and given immeasurable joy on account of its beauty, far in excess of any other flower, but it has provided material to the scientist, to the seed grower, to the seedsman and to the press calling for their respective abilities and putting them to the test in a great variety of ways. The question has arisen in many minds, "How long will it continue?" For the last five years I have heard it said that the sweet pea was at the height of its popularity, but the height of the great mountain of sweet pea possibility has not yet been A year or two ago we stood on some prominence where the high peak seemed only a day's climb further, but today our climb has brought us to another height, from which we can vet see the highest peak far above, though the fog has not lifted from its summit, and we can only imagine the highest point. As we look back and take in the view below, the scenery is grand. We have climbed over some rough parts, but our imagination urges us to climb vet higher, for as we climb this mountain our view will be finer and grander. We will have some rough places to conquer, oftentimes necessitating the use of guide ropes, but with the assurance that our fellow travelers are linked to us, these obstacles will be surmounted.

The first line along which we should consider the subject is naturally the raising of varieties.

The sweet pea, history records, was first noticed by Cupani, a monk in Sicily, in the year 1699, and a few seeds were sent to England. It was long before variations took place, and about the year 1793 we find that black, purple, scarlet and white varieties were offered for sale. Seven years later a black purple was offered, and thirty-seven years later a striped flowered could be had. In 1860 the first edged variety appeared. Ten years later Henry Eckford, whose name will always be associated with sweet peas as long as sweet peas are grown, began his great life work. Varieties now came much faster, but at first the stocks were badly mixed. While ignorant of the laws of Mendelism, Eckford by careful selection was afterward able to put his novelties on the market fixed. The varieties of the past and their coloring must have been considered wonderful, and to read over some of the descriptions given is now amusing, when we think of present-day flowers.

The coming of the Spencer in 1901, and how this flower captivated all growers and brought about present conditions in the sweet pea world is well known. We have to be thankful, however, that the original Spencer sweet pea was such a beauty, as had Spencer form first appeared in some of our varieties today, the name of which I leave to you, I fear it would have passed unnoticed.

Following Countess Spencer, novelties were showered on the market in profusion, but mostly in a wretched state of unfixedness. Seedsmen were too anxious to sell their production, but gradually things have settled down and today conditions are much improved.

Besides the coming of Spencers there were other variations of value. Of these the early flowering type was perhaps the most important owing to its place with florists. Then the cupid varieties and bush varieties were introduced by the American growers, but these never gained a wide popularity.

The present day finds us with a list of sweet pea names some two thousand in number. From the list we can pick out such gems as King Edward Spencer, Elfrida Pearson, Countess Spencer, George Herbert, Mrs. Cuthbertson, Melba, Bertrand, Deal, Illuminator, Margaret Atlee, Morse's Monday Morning, Margaret Madson 2d, Miriam Beaver 2d, Doris Usher, Helen Lewis, Hercules, King White, Rosabelle, Mrs. C. W. Breadmore, America Spencer, Jessie Cuthbertson Spencer, R. F. Felton, Asta Ohn, Dainty Spencer, Thomas Stevenson, Nubian, Vermilion Brilliant, etc. What wonderful coloring has been produced and what remarkable size. Fifteen years ago had we seen a plant of Prima Donna or Katherine Tracy bearing four blossoms on one stem, with even a suggestion of the size of sav Elfrida Pearson, even poorly grown, we should have looked for the immediate death of the plant. Truly the work of hybridizers has been wonderful, and whoever they may have been, lovers of flowers will pay tribute. The extensive list of Spencers in most diverse shades, bears ample testimony to their work. Some people, principally in America, should be reminded that "even Burbank in all his glory has not arraved one of these.

What has the future in store? To my mind it will bring forth things which have never been dreamed of. Already we have had a glimpse of what is coming by the new true double flowers. These are quite different from the duplex type. They are most wonderful flowers, and will rival the most expensive orchid, perhaps not only in beauty but in price, as the seeding qualities are very light.

Then in the early flowering section I look for good, fixed Spencer flowers in colors suitable for florists, and with the desirable qualities of the early flowering varieties of the past. There is yet much room for improvement in this section and an idea of what is to come can be had from the Australian variety Yarrawa Spencer.

In Cupids I look for an improvement in the form of Spencers having the Cupid growth and the long stems, large flowers, and colorings of the Spencer varieties.

Perhaps one of the most remarkable changes in sweet pea matters has been in the cultural methods. In years past the amateur dug his garden in the usual way, which was often poor enough, and then made a little drill with his hoe in which the peas were sown as thickly as possible. There were many ways resorted to in training them or supporting them.

Only a few keen growers ever thought of manuring or feeding the plants, and the result was a fine, thick hedge of medium height. A great contrast to that is the culture of the keen growers today. Growers have learned that thick planting was unnecessary, possibly they were helped to realize that by the price of seed. Then disbudding has been resorted to and the growing on the single stem system, thereby producing enormous flowers. It is nothing unusual to find growers spading the ground two and three feet deep incorporating manures with great care and knowledge. The plants are fed with manures during the flowering period and many colors shades from the sun's ray to preserve the color. The sweet pea plant is watched with anxious eyes from its

What our cultural methods will develop into is beyond me to say, but improvements will come. Following along present lines we might expect to see some of our growers trying to grow their peas on the Dahlia system, allow-

first appearance above ground until the final blossom is

ing only one blossom to a shoot. Personally, I hope they never get that far; rather would I welcome a system of culture which will get away from the single stem principle and tend towards the old-fashioned hedge, but producing flowers as large and as handsome as those produced on single stemmed plants.

Abstract from paper read by F. G. Cutllertson, of San Francisco, before the American Sweet Pea Society at New York,

#### PLANTING PEONIES.

The peony is easy to grow, hardy everywhere without protection, and free from diseases and insect enemies. The flowers, which include white, yellow and every shade from flesh pink to deepest maroon, are large and showy without being coarse. Once established, peonies are permanent-large clumps have been flourishing and blooming regularly in old gardens for a quarter of a century with no attention whatever.

The peony family is divided into two general sections —the Peony officinalis, or herbaceous, and the Peony Moutan, tree or shrub peony, both of which are hardy. The former is the one that has been grown in the gardens of Europe and America for centuries, and is the forerunner of the present-day hybrids; the latter is an importation from Japan, where it is also grown in pots.

The herbaceous are single, semi-double and double; the Japanese family has a semi-double cup, in the center of which is a mass of petaloids, generally of a contrasting

color or shade.

Culture of the peony is comparatively simple, but for success two things must be kept in mind: It will not thrive in the shade or in a wet, undrained location. In locating a border or hedge of peonies look to the future as to shade. Give them the open border where they will have full sunshine. As a low hedge they fill every requirement if sufficient width is to be had.

As the peony is a permanent planting it should have a permanent bed or border. Dig to a depth of not less than eighteen inches and fill the trench with good garden soil—soil from an old garden that has been kept in a high state of cultivation is the best—the peony will not tolerate fresh manure.

If the subsoil is naturally well drained, no artificial drainage will be needed, but if it is of tough or sticky clay, or hardpan, a layer of drainage material consisting of broken stone or coarse cinders should be put in the bottom of the trench.

Peonies may be planted either in late summer or spring. Do not advise late fall planting. If it is not convenient to plant in the spring as soon as the soil can be worked, postpone planting until the first week of August so the plants will make root growth before winter sets in. In taking up and dividing the peony, most of the small fibrous roots are lost, and the plant should have an opportunity to replace some of these before it is subjected to the rigors of winter.

The question as to when to divide clumps of peonies is one for each gardener to decide, as it depends upon soil, climate and cultivation. It is safe to say that in the garden under the most intensive culture they will not need it in less than four years—the average is six. After a year, when the flowers have shown a lack of brilliancy or size it is safe to divide the clumps if they have not been touched within five or six years; the flowers are usually the best indicators.

When dividing take up the whole plant and remove not less than three "eyes" to a division, avoiding loss of roots and bruising as far as possible. Mulch through the winter with leaves, straw, or well-rotted manure, and remove the mulch early in spring.

Frequently peonies do not throw typical blooms the first blooming season; the finest double ones may then give single or semi-double blossoms. It is not until the third blooming season that one can look for the most satisfactory results from the peony-no matter what the culture has been.—Country Life.

#### AURICULAS FROM SEED.

The enthusiastic grower of Auriculas will be anxious to raise some seedlings, and at this season, when these beautiful flowers are appearing, a short note on the subject may be useful, for a man is not worthy of the name of florist if he does nothing in the way of seedling-raising to improve the flowers he cultivates.

The selection of parents is very important, and only the best varieties should be crossed. It is also advisable to mate a green-edged variety with another belonging to the same group; selfs should be crossed with selfs, and so on; while among the alpines the yellow-centered forms should be crossed together, and this remark also applies to the white and cream centered kinds. Having selected an Auricula which it is intended to use as the mother plant, the anthers must be removed with a pair of sharppointed scissors before the pollen is distributed. When performing this operation, hold the plant in such a position that none of the pollen cases falls down the tube. After two or three days the stigma of the prepared flowers may be dusted over with pollen from another bloom, using a fine camel-hair brush to convey the pollen. The seed should be sown directly it is ripe, viz., about July and August, in seed-pans or ordinary flower pots. These are filled one-third of their depth with drainage, and the usual potting compost employed. Germination is sometimes rather slow, and after pricking off the first batch the seed-pans may still be retained, because other seedlings will eventually appear. When the young plants have made their first leaf after the two seed leaves, they can be pricked off at the rate of about a dozen in a 3-inch pot. As growth advances they should be placed three in a similar sized receptacle, and at the next potting one in a pot, while a 3½-inch or 4-inch will be large enough for their final move. It usually takes about eighteen months for a seedling to reach its full size. A suitable rooting medium consists of good fibrous loam two parts, leafmould one part, and decayed cow-manure one part, which ought to be well mixed three weeks or so before it is required.—Exchange.

#### PROGRESSIVE CURIOSITY.

A hen stood on the garden lot, Whence all but her had fled, And didn't leave a planted spot In the early onion bed. With vim she worked, both feet and legs, And the gardener says he bets, She was trying to find the kind of eggs On which the onion sets.

#### OUR COVER ILLUSTRATION.

The illustration on the front cover is a reproduction of a photograph by William H. Waite, which shows an avenue of stately elms on Broadway, Yonkers, lining either side of "Greystone," the estate over which Mr. Waite presides. The property fronts on both sides of the avenue.

#### AMERICAN SWEET PEA SOCIETY SHOW.

The sixth annual summer exhibition of the American Sweet Pea Society, which was held in the American Museum of Natural History, New York, on June 27 and 28, proved a pronounced success, both in the quality of the sweet peas shown and in the number of exhibitors. Some excellent displays were made by such firms as W. Atlee Burpee & Co., Arthur T. Boddington, and William Sim. The private growers were much in evidence and showed some excellent flowers. The feature of the private display was an exhibit by Wm. Gray, gardener to Mrs. W. B. Leeds, Newport, R. I.

Harry Turner was manager of the show. The list of awards of the private growers' classes follows:

The Peter Hendersen & Co's prizes for 12 vases, 20 sprays to a

vase, of 12 distinct varieties of Spencer sweet peas Mrs. W. B. Leeds, Newport, R. I. (Wm. Gray, Gr.), 1st; Giraud Foster, Lenox, Mass. (Edwin Jenkins, Supt.), 2nd; M. T. Cockeroft, Saugatuck, Conn. (Adam Paterson, Gr.), 3rd.

The Arthur T. Boddington prizes for a collection of sweet peas, 25 varieties, not less than 25 stems to a vase, to be shown with sweet pea foliage only-Mrs. W. B. Leeds, 1st; Adolph Lewisohn, Ardsley, N. Y. (Jno. Canning, Gr.), 2nd; Mrs. Benj. Stern, Roslyn, L. I. (W. D. Robertson, Gr.). 3rd.

The Stumpp & Walter Co.'s prizes for six vases of sweet peas, six distinct Spencer varieties, 20 sprays to the vase—J. J. Downey, Portchester, N. Y. (Thos. Ryan, Gr.), 1st; Giraud Foster, 2nd; Mrs. Robt. Winthrop, Lenox, Mass. (A. Carlquist, Gr.), 3rd.

The Henry A. Dreer prizes for the best vase of Florence Nightingale sweet peas—H. Darlington, Mamaroneck, N. Y. (P. W. Popp, Gr.), 1st; J. W. Pepper, Jenkintown, Pa. (W. Robertson, Gr.), 2nd.

Vase Queen Alexandra Spencer sweet peas-J. W. Pepper, 1st. Vase White Spencer sweet peas—Giraud Foster, 1st; J. W. Pep-

per, 2nd.

The Mount Desert Nurseries' prizes for the best vase of sweet peas, one variety, any color, 25 stems arranged for effect. Any other foliage than sweet pea may be used Mrs. W. B. Leeds, 1st; H. W. Fischer, New Canaan, Conn. (R. Bottomley, Gr.), 2nd.

The Watkins & Simpson prize for six vases Spencer sweet peas, six distinct colors, 25 sprays to a vase—Paul M. Warburg, Harts-

dale, N. Y. (Frank C. Luckenbacher, Gr.), 1st.
Twenty-five blooms sweet peas, Apple Blossom Spencer, with foliage. The Michell Silver Medal-Paul M. Warburg, 1st.

Vase sweet peas, Spencer varieties mixed with foliage, not less than 100 blooms. The Michell Silver Medal-M. T. Cockeroft, 1st. The Knight & Struck Co.'s prizes for best vase of sweet peas, containing 25 sprays, in variety, of which no two are alike in shading—Mrs. W. B. Leeds, 1st; J. J. Downey, 2nd; Giraud

Foster, 3rd.

The Burnett Brothers' prize for the best three vases of sweet peas; distinct colors, 50 sprays to a vase—Paul M. Warburg, 1st. The American Sweet Pea Society's prizes for the best display

for effect, covering a round table about four feet across-A. A. Mason, Tuxedo, N. Y. (David S. Miller, Gr.), 1st; Highlawn,

Lenox, Mass. (Geo. Foulsham, Gr.), 2nd.

Decoration for table of eight covers, glasses, cutlery and linen to be used-F. Berthused, Greystone, Yonkers, N. Y., 1st; H. L. Pratt, Glen Cove, L. I. (Hy. Gaut, Gr.), 2nd.

The W. Atlee Burpee cup for the finest 12 vases of sweet peas,

12 varieties—Paul M. Warburg, 1st.

The W. Atlee Burpee prizes for the best vase of one variety of Spencer type sweet peas introduced 1914-J. J. Downey, 1st; Giraud Foster, 2nd; Mrs. Moses Taylor, Mt. Kisco, N. Y. (Alex. Thomson, Gr.), 3rd.

The Sutton & Sons' prize for the best table of sweet peas, covering 12 square feet, and not to exceed three feet in height-

Highlawn, 1st.

The Weeber & Don prize for vase of 100 sprays mixed sweet peas, arranged for effect-W. E. Reis (M. Grunert, Gr.), 1st.

The Horticultural Society of New York Prizes:

Twenty-five sprays, any pure white—Mrs. Robt. Winthrop. 1st, with King White; Mrs. W. B. Leeds, 2nd; Giraud Foster, 3rd.

Twenty-five sprays, any crimson or scarlet—Mrs. Robt. Win-

throp, 1st, Vermilion Brilliant; Mrs. W. B. Leeds, 2nd; Mrs. Moses Taylor, 3rd.

Twenty-five sprays, any rose or carmine—Giraud Foster. 1st. with Geo. Herbert; Mrs. Moses Taylor, 2nd; Paul M. Warburg. 3rd.

Twenty-five sprays, any light pink-Mrs. W. B. Leeds, 1st, with Elfrida Pearson; Mrs. Robt. Winthrop, 2nd; Mrs. Moses Tay-

Twenty-five sprays, any deep pink—Mrs. W. B. Leeds, 1st, with Constance Oliver; Mrs. Robt. Winthrop, 2nd: Mrs. Moses Taylor, 3rd.

Twenty live sprays, any blue Mrs. W. B. Leeds, 1st, with Blue Jacket: Giraud Foster, 2nd; Mrs. Robert Winthrop, 3rd.

Twenty-five sprays, any cerise Daniel G. Reid, Irvington, N. Y. (Arthur Golding, supt.), 1st, with John Ingman; J. D. Barron, Rye, N. Y. (J. Linane, Gr.), 2nd.

Twenty-five sprays, any cream or cream yellow-Giraud Foster, 1st, with Princose Beauty; Mrs. Robt. Winthrop, 2nd; Mrs. Moses

Taylor, 3rd.

Twenty-five sprays, any salmon or orange Mrs. Robt. Winthrop, 1st; Mrs. W. B. Leeds, 2nd; Giraud Foster, 3rd.

Twenty-five sprays, any lavender or mauve. Mrs. W. B. Leeds, 1st; Mrs. Robt. Winthrop, 2nd; Giraud Foster, 3rd.

Twenty-five sprays, any violet or purple Giraud Foster, 1st, with Purple Prince; Mrs. Robt. Winthrop, 2nd; J. M. Cooke, Tarrytown, N. Y., 3rd.

Twenty-five sprays, any Picotee edged A. A. Mason, 1st, with Elsie Herbert; Mrs. A. Crane, Stamford, Conn., 2nd; Mrs. W. B.

Leeds, 3rd.

Twenty five sprays, any striped or flaked red or rose. Mrs. W. B. Leeds, 1st. with American Spencer; Giraud Foster, 2nd; Mrs. Robt. Winthrop, 3rd.

Twenty-five sprays, any striped or flaked blue or purple. Mrs. W. B. Leeds, 1st, with Loyalty; Mrs. Moses Taylor, 2nd; Giraud Foster, 3rd.

Twenty-five sprays, any bicolor other than Picotee-edged-Mrs. W. B. Leeds, 1st, with Mrs. Cuthbertson; Mrs. Robt. Winthrop, 2nd; Mrs. Moses Taylor, 3rd,

Twenty-five sprays, any other color distinct from the above-Giraud Foster, 1st, with Senator Spencer; Mrs. Robt. Winthrop, 2nd; Mrs. Moses Taylor, 3rd.

The F. R. Pierson Cup awarded to the exhibitor taking the most first prizes in section G—Mrs. W. B. Leeds.

The Garden Magazine achievement medal awarded to the finest vase of sweet peas in section G -Mrs. W. B. Leeds.

The following varieties were exhibited for the Boddington Challenge cup, 25 vases in 25 varieties; Alfrida Pierson, Lady Evelyn Eyrc, Charles Foster, Empress Eugenie, Martha Washington, Mrs. C. W. Breadmore, Prince George, Wm. Nubian, Queen of Norway, Dorothy Tennant, Wedgewood, Hercules. Thos. Cuthbertson, Blue Jacket, Clara Carter, Mayd Holmes, Helen Lewis, Loyalty, King White, Rosabelle, Etta Dyke, America, Thos. Stevenson, Orchid and John Ingman.

MRS. W. B. LEED'S (WM. GRAY, GARDENER, NEWPORT, R. I.) COLITO TION OF AS VASES IN 25 VARIETIES, WINNING THE BODDINGTON CHALLENGE CUP.

#### THE CONVENTION.

A fairly good attendance was present at the annual convention of the American Sweet Pea Society, which was held on Saturday afternoon of the annual flower show in the Museum building. F. R. Pierson, president of the Horticultural Society of New York, welcomed the visitors, which was responded to by Vice-president Arthur M. Kirby, of the Sweet Pea Society. President William Sim spoke briefly on the progress of the sweet pea and the growing interest in its national society. The secretary, Harry A. Bunyard, in his report said:

Right at this spot six years ago almost to a day, July 7, 1909, The American Sweet Pea Society was born. At that time I said, "The Sweet Pea Society should be a success, must be a success." I leave it to you that at least we are on our way, if we take the trouble to look over the exhibits now shown here in this building, perhaps the finest general exhibit of Sweet Peas ever shown in this country -if not in the world. Nearly sixty exhibitors and over 2000 vases of Sweet Peas besides table and other decorative features.

We have with us today nearly all our charter members with perhaps one great exception, the gentleman who helped us to organize our society when we needed all the moral support that could be brought to bear. I allude to the late Prof. John Craig, who was indeed a gentleman and a scholar and who organized our trial grounds at Cornell University and which today are under the efficient guidance of Prof. A. C. Beal.

The following bulletins have been issued up to date; No. 319, "Winter-flowering Sweet Peas"; No. 320, "Culture of the Sweet Pea," and No. 342, "Classification of Garden Varieties of the Sweet Pea"; all of which have been sent to the horticultural press and to our members in good standing; today they are

standard works.

In the past ten years, there have been great strides and advancement made in the Sweet Pea. From the Grandiflora type has evolved the Spencer type, the Winter-flowering Grandifloras and now the Winter-flowering Spencers. The American Sweet Pea Society has helped to advertise the Sweet Pea for us all and has helped to put it on the horticultural map.

I want to thank the horticultural press at this time however, for their unqualified support and for the gentlemen who are not only members, but who have given their time and financial sup-

port far beyond their obligations to the society.

We have today all told, about 200 members in good standing and 14 life members. Our financial condition is healthy; no big surplus, but money enough to take care of all obligations. Apart from the exhibition, we do not owe a penny and this is so far financed that we shall more than come out even; through guarantees, donations and prizes generously offered by the trade and

others. We have no paid officers.

During the past six years we have held nine exhibitions; six Summer and three Winter; two in New York, under the auspices of the Horticultural Society of New York; two in Boston, under the auspices of the Massachusetts Horticultural Society; one in Philadelphia, under the auspices of the Pennsylvania Horticultural Society, and the three Winter exhibitions in co-operation with the S. A. F. and O. H. National and other flower shows awarding during that time nearly \$10,000 in cash, cups, medals and other prizes in kind.

I am grateful for all our support, especially to the Horticultural Society of New York, the Massachusetts Horticultural Society and the Pennsylvania Horticultural Society, who have been more than generous and courteous in the past. The future, too is brighter today than ever for our youthful and useful society, and in conclusion I might add the prophetic simile of the Rev.

W. T. Hutchins.

"The Sweet Pea has a keel that was meant to seek all shores; it has wings that were meant to fly across all continents; it has a standard which is friendly to all nations; it has a fragrance like the universal Gospel; yea, a sweet prophecy of welcome everywhere that has been abundantly fulfilled."

HARRY A. BUNYARD.

F. G. Cuthbertson, of San Francisco, Cal., extended an invitation to the society to hold its 1915 convention in that city in connection with the Panama-Pacific Exposition. The invitation was referred to the executive committee.

In the election of officers which followed, Leslie L. Morse, of San Francisco, was elected president; A. M. Kirby, re-elected vice-president; Harry A. Bunyard, of New York, re-elected secretary; Arthur T. Boddington, of New York, re-elected treasurer; John H. Pepper, of New York, re-elected recording secretary. William Sim was elected to the vacancy on the executive committee.

Professor A. C. Beal made an interesting report on the society's trial grounds at Cornell University, which provoked considerable discussion of a favorable nature, in which Messrs. Boddington, Fuld and Kirby participated. It was decided that these tests should be continued. Mr. Cuthbertson followed with an interesting paper on "Sweet Peas—Past, Present and Future" (extracts of which will be found in another column of the Chronicle). The meeting then adjourned to attend a banquet of the judges at the Hotel Endicott.

It was authoritatively stated that the success of the Sweet Pea show in New York this summer assures

a similar show for New York City in 1915.

#### THE BANQUET.

The banquet was a very enjoyable affair. The menu

was excellent and the speeches were brief and to the point, A. T. Boddington acting as toastmaster.

The toasts and those who responded were as follows: The Horticultural Society of New York, T. R. Pierson; the Judges, Geo. Kerr; the American Sweet Pea Society and the Sweet Pea, Wm. Sim and Harry Bunyard; the Panama-Pacific International Exposition, Frank G. Cuthbertson; the New York Florists' Club, Jos. A. Manda; the Wholesale Grower, A. Herrington; the Retail Florist, G. E. M. Stumpp; the Gardener, W. Angus; the Amateur, J. W. Everett; the Seedsman, A. M. Kirby; the Press, J. Harrison Dick; the Ladies, J. H. Pepper.

Those present were: William Sim, F. R. Pierson, G. E. M. Stumpp, Jos. A. Manda, Robert Koehne, Samuel Burnett, Harry Turner, J. H. Dick, W. H. Waite, Frank G. Cuthbertson, John Canning, Percy E. Hicks, Wm. Gray, A. F. Faulkner, W. Angus, C. Knight, Geo. Kerr, J. Carman, J. S. Lynes, C. W. Ashmead, J. Austin Shaw, J. H. Pepper, Harry Bunyard, A. G. Calkin, J. W. Everett, Philip Freud, Fred Michell, Jr., A. Watkins,

A. M. Kirby and Superintendent Foulk.

#### PRELIMINARY SCHEDULE.

American Gladiolus Society Annual Exhibition, Boston, Mass., August 18, 19 and 20, 1914.

OPEN CLASS

Vaughan's Seed Store—\$10, best 25 spikes Gladiolus Mrs. Francis King; Vaughan Silver Medal, best 25 spikes Chicago White; \$5, best 25 blooms Vaughan's New Primulinus Sunbeam. E. E. Stewart—\$5, best 12 spikes of Black Beauty; \$5, best 12 spikes of Golden Queen; \$5, best 12 spikes of Lucille; \$5, best 12 spikes of Michigan.

W. E. Fryer -\$5, best 6 spikes Gladiolus Mrs. W. E. Fryer. T. A. Havemeyer—\$10, best 6 spikes white; \$10, best 6 spikes pink or shades of pink; \$10, best 6 spikes yellow; \$10, best 6 spikes blue or layender; \$10, best 6 spikes red or shades of red; \$10, best 6 spikes or any other color.

(In judging, the following points are to be taken into consideration; color, as clear as possible; size, large and well expanded

bloom: spike, strong with flowers evenly set.)

W. Atlee Burpee & Co. \$10, best collection 10 varieties 6 spikes each.

H. W. Koerner \$5, best 12 spikes American Wonder; \$5, best 12 spikes Twilight Chief; \$5, best 12 spikes American Giant.

Jacob Thomann & Sons—\$5, best 25 spikes of any white variety.

Montague Chamberlain—\$10, best white seedling 3 spikes; \$10, best yellow seedling 3 spikes; \$10, best pink seedling 3 spikes.

#### GARDENERS' CLASS.

John Lewis Childs—For collection 10 vases Gladiolus Childsi named varieties, \$10 first prize, \$5 second prize.

H. W. Koerner \$5, best 12 spikes American Wonder; \$5, best 12 spikes Twilight Chief; \$5, best 12 spikes American Giant.

Knight & Struck Co.—For Vase containing 3 spikes Gladiolus Mrs. Frank Pendleton, \$3 first prize, \$2 second prize; for vase containing 3 spikes Gladiolus Badenia, \$3 first prize, \$2 second prize.

"The Modern Gladiolus Grower"—Silver Cup valued at \$15. For largest and best display of mixed and named varieties, to contain at least 6 named varieties, correctly labeled. Three spikes each

Jacob Thomann & Sons—\$5, best 3 spikes of any white variety. L. Merton Gage—\$5, best vase of 10 varieties, one spike each. G. D. Black—60 bulbs Golden King. Best vase of yellow varieties.

American Gladiolus Society—Best exhibit of at least 15 varieties 3 spikes each, correctly labeled, Silver Medal first prize; Bronze Medal second prize.

#### OPPORTUNITY.

To each man's life there comes a time supreme: One day, one night, one morning or one noon. One freighted hour, one moment opportune. One rift through which sublime fulfilments gleam. Ah. happy he who, knowing how to wait. Knows also how to watch and work and wait. On life's broad deck alert, and at the prow To seize the passing moment, big with fate, From opportunity's extended hand. When the great clock of destiny strikes Now!—Selected.

# The White House Gardens, Washington, D. C.

The illustrations shown are reproductions of recent photographs of the White House Gardens, adjoining the Chief Executive's mansion, at Washington, D. C. The gardens located south of the White House, which were known as the colonial gardens of Mrs. Roosevelt, were originally designed and planted by the late Geo. H. Brown, landscape gardener of the office of public buildings and grounds. These gardens were entirely remodeled last Fall and are divided into two sections known as the east and west gardens. Miss Beatrice Jones, lanscape architect, prepared the plans for the remodeled east garden. It called for material which was not available, so after consultation with Mrs. Wilson it was decided to substitute some of the evergreens and hedges called for but not to interfere with the general outline of the plans.

The planting of the herbaceous borders and the four panel beds was personally supervised over by Mrs. Wilson, whose excellent taste for blending colors was fully demonstrated by the splendid results produced at the time the photographs here shown were taken. Some of the evergreens and shrubs used in the east garden are Juniperus Virginiana glauca, Rollinson's aborvitae, Osmanthus, illicifolius, Euorymus japonica, Kalmics, Althea and Roca setegera. The herbaceous plants used were Hollyhocks, Foxgloves, Phloxes, Anemones, Lupens Coreopsis, Seanthus, Wallflowers, Lilium Candedum, Iberes, Sweet Alyssum, Peonies, Myosotes English Daisies, Pansies, Japanese and German Iris.

The plan for the west garden was prepared by George Burnap, landscape architect of the office of Public Buildings and Grounds Department, and it will be seen that the design is entirely different from that of the east garden, it being Mrs. Wilson's desire to avoid similarity.

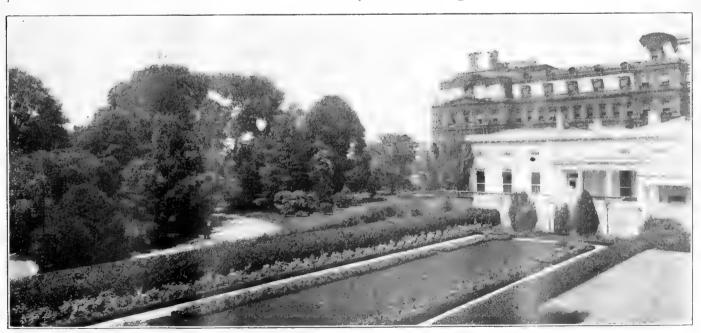

In the background of the photograph reproduced of the west garden of the State. War and Navy Departments can be seen and immediately in front of it is the president's office building. On the right hand side between the hedge and corridor is a walk leading directly to the president's office. The archways are of privet with a row on either side of standard roses. Looking west are two very fine Irish yews, between which is to be placed a statue with a background of ivy. The lattice work is planted with climbing roses which, when they reach the pergola, will be permitted to hang over. Some of the varieties of roses planted in this garden are Killarneys, Antoine Revoire, Duchess de Brabant and Lady Hillington. The effect produced when these roses were in full bloom was a beautiful one and brought forth a great deal of favorable comment from visitors to the garden. Mrs. Wilson also supervised the planting of this garden, and, as in the other garden, her refined taste is very much in evidence.

The construction work in the remodeling of these gardens was under the immediate direction of Colonel W. W. Harts, the engineer officer in charge of public buildings and grounds, who combines with his engineering

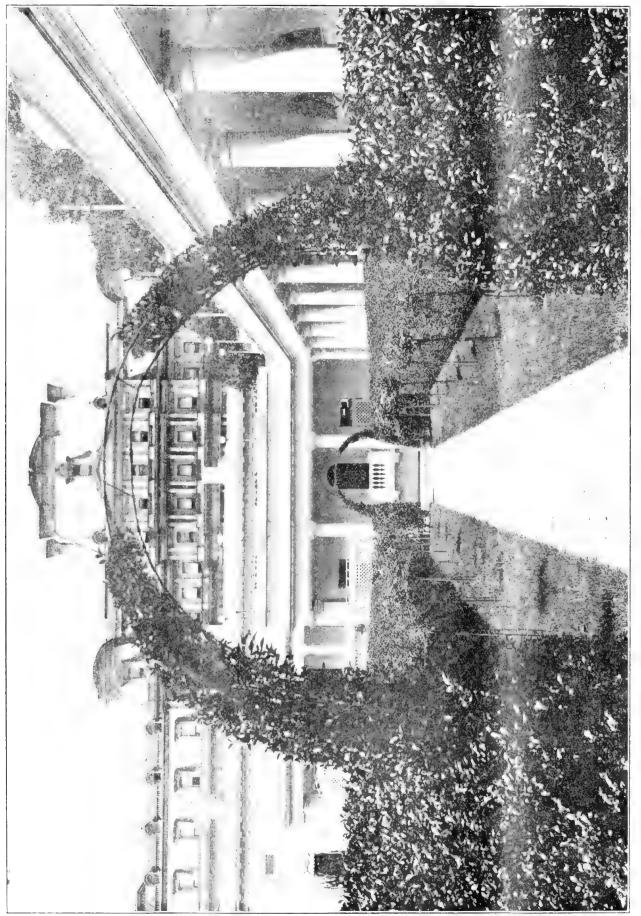

ability quite a taste for the beautiful.

Mrs. Wilson's interest is by no means confined to the outside gardens, for she is equally as fond of the greenhouses as she is of the outside plantings. During her spart moments she never misses an opportunity to pay them a visit. Her favorite flowers are the roses-Sunburst, Radiance, American Beauty, and the Killarneys. Enchantress is her favorite carnation, and these are grown in abundance in the White House greenhouses. Tropical flowering and foliage plants are also grown in these houses in large quantities to supply the interior decorations of the Executive Mansion.

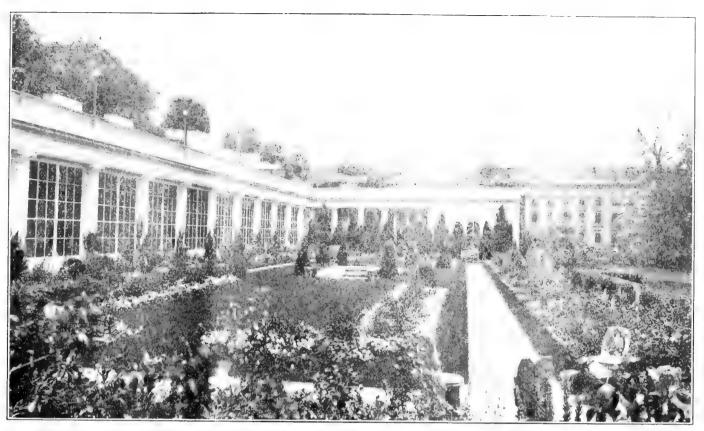

The gardens and greenhouses are in charge of Head Gardener Charles Henlock. Mr. Henlock has been emploved on the White House grounds for nearly a quarter of a century. For twenty years he was under the late George H. Brown, but for the last five years has had entire charge of the White House park, greenhouses and gardens. He came direct to Washington from England where he was previously employed under the late Archibald Barron, superintendent of the Royal Horticultural Society's gardens at Chiswick. Mr. Henlock's ability is well exemplified in the perfect upkeep of the White House grounds and the excellent stock which is produced in the greenhouses.

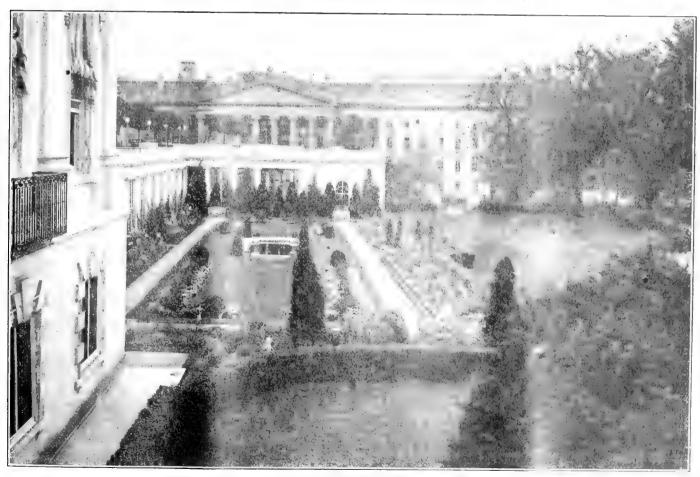

A VIEW OF THE WEST GARDEN, WHITE HOUSE GROUNDS, SHOWING THE PRESIDENT'S OF. . IN FOREGROUND, STATE. WAR AND NAVY DEPARTMENT BUILDING IN BACKGROUND

THE PRESIDENT'S WALK IN THE WEST GARDEN LEADING DIRECTLY TO HIS OFFICE, ENCLOSED WITH PRIVET, THE PATH IS LINED ON LITHER SIDE WITH ROSES.

Vol. XVIII.

JULY, 1914.

No. 3.

Elsewhere in these columns we print several communications from young men of the gardening profession. They are of the kind that express the right spirit; the sort that will lead to success if the writers will follow the thoughts they are sending forth. "A Young Member" advises well when he says that the young men must not conceal within themselves what their capabilities are, but must seek opportunity where others can learn of them. We are reminded of a message received from a professor of one of the leading agricultural colleges, following his visit to the New York Flower Show, in which he expressed gratification over having had the pleasure "to meet such prominent horticulturists as Waite, Totty, Turner, Duckham and Herrington," of whom he had heard and read so much about. None of the men mentioned will claim to have accomplished more in his profession than many other men are accomplishing, but they possess the wisdom to "let their light so shine before men that they may see their good works." opportunity presented itself they were ever ready and willing to display their ability and did not hesitate to reveal to others the knowledge they possessed, which made them prominent in their profession and gained a reputation for them as leaders in horticulture. There are many gardeners who have had, and still have equal opportunity for prominence in their profession, but who persist in hiding within themselves.

The sentiment expressed by "Assistant Gardener" voices our own sentiments, which we have not hesitated to express from time to time in these columns. We have met many young men who would prefer the position of head gardener on a small place at poor pay, and where their chances to gain more than the limited knowledge they already possess of their profession is nil, to that of a well paid assistant's position on a complete private estate where every opportunity presents itself for better education. They seek their title early, but in time must join the ranks of the so-called gardeners, for when opportunity sought them they failed to grasp it.

We believe the experience of Frederick Liston is not a common one. Such places as he refers to do not really want real gardeners, but garden laborers. There is no way to regulate such conditions, as is suggested by him, for the man who buys service and material has the making of his terms; it is left to the seller to accept or reject

as he sees fit.

One of the well-known British firms of seed growers is capitalizing the fact, in a pamphlet which is being circularized world wide, that its share of the order for the U. S. Congressional free seed distribution this year amounted to no less than forty-four tons and that orders for the free seeds went to four other English, French and Dutch seed growers.

We can hardly conceive why this wasteful appropriation of many millions of dollars should be permitted to find its way abroad, and why, if Congress will insist on continuing this much abused free seed practice, a stipulation is not included in the appropriation that the money is to be expended for American grown seeds only. Though Congress may persist in being wasteful with public funds it should at least remain patriotic. Or is it that the American seed growers have refused to become a party to this graft of public funds—it is nothing more -to serve congressmen whose constituents will stoop to accept the favor of a few packets of seeds in return for their support at the polls. The farce of it all is that the farmer is being burdened with governmental bulletins instructing him how to part with his money, but when Congress has the opportunity to turn some his way it ships it abroad to be distributed among European farmers.

#### PRESAGE OF WOE.

My mood is most gloomy and sober, Though joyously fair is the sky; I pine for the frosts of October, And this is July.

Green-rimmed by its tapering rushes The little brook gurgles along; The willow copse peopled with thrushes Is vibrant with song.

With nature thus voicing its gladness, With all its sweet features aglow. Twere really the acme of madness To prophesy woe.

And yet I have cause to be glooming. Ay! very grave cause to be blue: Today I found rag-weed a-blooming-My hav-fever's due!

My mood is decidedly sober; The terrors of August are nigh; I pine for the frosts of October, -Selected. And this is July!

## NATIONAL ASSOCIATION NOTES

M. C. EBEL, Secretary, MADISON, N. J.

#### DOINGS OF THE COOPERATIVE COMMITTEE

The National Cooperative Committee which is to operate in conjunction with the cooperative committees appointed by the local societies, expects to have its plan completed by the early fall and be prepared to send out its first communication at that time setting forth what its contemplated plan of action is. It will indicate how the local committees can aid the cooperative movement.

#### THE SUMMER MEETING.

John Young, secretary of the S. A. F., in charge of arrangements of the meetings at the S. A. F. convention, has appointed Wednesday morning, August 19, as our meeting time in the convention hall. Full particulars of the meeting and its program will be published in the August issue of the Chronicle, which will be issued in advance of the convention. As reported in the June issue, several able speakers have expressed their willingness to appear at the meeting to address it on subjects interesting to the gardening profession.

#### THE NEW YORK TO BOSTON TRIP.

Members contemplating making the trip from New York to Boston via the outside route of steamers, which land direct in Boston, should lose no time in communicating with the secretary to reserve their accommodations. The fare from New York to Boston is four dollars. Outside stateroom two dollars. Inside stateroom one dollar. Staterooms contain two berths each.

The Copley Square Hotel will be the official head-quarters of the N. A. G., and accommodations may be reserved there by applying before the convention. The rates are as follows: Single room without bath, \$1.50 per day; larger outside room, \$2; court room, with private bath, \$2 a day; outside room, with private bath, \$3 a day. The above rates are for one person; \$1 additional per day will be charged for two persons occupying one room. Reservations may be made either through the secretary or by applying direct to the hotel, mentioning the N. A. G. in making reservations to obtain above favorable rates.

# THE ASSOCIATION'S BY-LAWS FOR DISTRIBUTION.

Notice is again given that the Constitution and By-Laws of the association have been printed in book form for distribution among any of its members who may desire to obtain a copy of the same. A request to the secretary's office for a copy will receive prompt attention, and a copy of the By-Laws will be forwarded to any member who may apply for one.

#### A TIMELY SUGGESTION.

I would like to make a suggestion to you, which your speech at Lake Geneva brought to me. You said that you specially wanted to get the young gardeners interested in the National Association of Gardeners. I was thinking that it would be something of an inducement if you were to have an annual essay competition, or something similar, for young gardeners who never have had a head gardener's place, and who are members of the association. If certificates were awarded, I am sure that

the lucky recipients would be very proud of them, and the ones who were less fortunate would try harder the next time. I would be pleased if you would bring this before the next meeting of the N. A. G. to see if they would approve of it. Hoping that you will give this your consideration.

Lake Genevalte.

Lake Geneva, Wis.

The foregoing communication will be referred to the National Cooperative Committee of the National Association of Gardeners, which is empowered to act on such matters. The writer may rest assured that his suggestion will receive favorable consideration.

#### AMONG THE GARDENERS

Samuel Batchelor, for the past twelve years gardener at Crosswicks Farms, Jenkintown, Pa., of which Thomas W. Logan is superintendent, has secured the position of manager of "Tahoma," the estate of Frank C. Littleton, Mamaroneck, N. Y.

Peter Duff, superintendent of "Brighthurst," Orange, N. J., sailed for Scotland on July 4. It is expected that Mr. Duff will be home again in time for the summer meeting of the N. A. G., of which he is a trustee.

It has just become noised about that Stanley Candler, superintendent of the W. B. Thompson estate, Yonkers, N. Y., took the marriage vow early in June—fuller particulars are lacking, but congratulations are in order.

\*

Walter Miller recently accepted the position of head gardener on the estate of Dr. Williams, Prospect street, Hartford, Conn. Mr. Miller was previously engaged on the commercial establishment of A. N. Pierson, Inc., Cromwell, Conn.

W. C. Rust, superintendent of the Weld Estate, Brookline, Mass., has the sympathy of his many gardening friends over the death of his father, Robert Rust, who was a well-known gardener in Scotland.

Arthur Herrington, of Madison, N. J., has been appointed manager of the August show to be held in Newport, R. I., under the auspices of the Newport Garden Club and Horticultural Society.

John Dodds, superintendent of Lindenhurst, the Wanamaker estate, Wyncote, Pa., sails on the S. S. Celtic, July 23, for a six weeks' vacation to England and Scotland, accompanied by his daughter, Miss Mary Dodds. Mr. Dodds expects to visit some of the large estates in England and Scotland on his trip.

#### SUMMER MEETING

National Association of Gardeners, Boston, Mass., August 19, 1914

#### A SPIRIT WORTHY OF ENCOURAGEMENT.

Much has been said and written comparing the standard of efficiency of present-day young gardeners with those of past generations. The young gardeners of to-day are too often the subject of unjust and biased criticism by members of the old school, but most assuredly the high standard to which gardening has now attained has been, and still is, being wrought by the alert, keenly interested and industrious young men of the profession equally as much, if not more, than by the old-timers. The whole basis of horticulture has developed until now we have gardening schemes that were never dreamt of twenty or thirty years ago. This being so, is it not true that in order to become thoroughly proficient a young gardener has nowadays a more complex problem to deal with than was hitherto the case?

Gardening of today demands of a man a keener intellect, untiring industry and uniform courtesy, as well as a knowledge of science, since he is expected to know the chemical constituents of the various fertilizers, insecticides and fungicides which he handles, to say noth-

ing of the engineering side of things.

How often nowadays are gardeners called upon to superintend electric light plants, pumping engines, and

so forth?

To my mind this adverse criticism to which we all are too frequently subject is due to the fact that we ourselves are reluctant in giving publicity to our own convictions. Surely those of us who have a sufficient love for our calling to become members of the National Association, and readers of the official organ, could, if only we tried, make the paper even more interesting for one another by an occasional contribution to its pages.

We could scarcely hope to enlighten the old-time warriors, farther than letting them see that we were right on the path of fitting ourselves to become their worthy successors by aiming at something higher than a mere struggle for an existence to be gained from the land we

cultivate.

The daily charm which our environment affords at different seasons of the year would cease were it possible to maintain a sameness of things the year round. To the enthusiast each change of season brings its own peculiar enchantment, and lovers of horticulture ought to be grateful that the year and the human heart have room

for changes.

To what end, then, would this aptitude for acquiring a literary talent lead us? Surely to a wider conception as to future requirements of the gardening art and a fresh interest in life, besides its being a stimulus to our daily work. Men who live entirely within their own little sphere in time become narrow of perception, and the humdrum of their daily toil proves burdensome, even though they themselves might be physically fit. Most of us can do our share of the actual work, but when arrangements for future months and, indeed, some times vears, come under consideration, we shall feel the benefit to be gleaned at this time from a careful and frequent exercise of our own minds, and the more scope we allow ourselves in this direction the better equipped shall we be to take the place of those who are wont to criticise our feeble yet earnest efforts.

"A Young Member."

Southampton, N. Y.

#### REASON OF CHEAP GARDENERS.

From Horticulture,

While Mr. Watson has been breaking a lance with the secretary of the N. A. G. respecting the merits and demerits of the aims and objects of that organization, some of the younger

school have been looking on and like the young rooster, would like to try a hand a-crowing now that the old ones are through, or apparently so. So we beg to be allowed to set forth our views as one who is working in the ranks of assistant gardeners and therefore able to bear the trend of feeling in that direction. The desire of most persons who enter gardening is to get to the top, and that as soon as possible. So should it be; but there is one very important factor which many seem to overlook. "Will I be competent to hold a job and can I give results that would reflect credit upon the profession to which I belong?" is a thought that occurs to a very small percentage. The fact that a man has worked as assistant for fifteen years, or that he is thirty years old next birthday, does not make him a competent gardener any more than because he can run a greenhouse satisfactorily he can also manage an estate. Another thing that is responsible for inefficiency among gardeners is that as soon as a young man enters the business he wants a job in the "houses" so as to be steady, and no attention whatever is paid to the outdoor branches of the work once he has started to pull weeds out of the benches and scrub the walks. Furthermore, there are some in our ranks who have had a limited experience in more than one branch of the art, and who do think they are fully equipped for the many duties that devolve upon the real gardener.

A short time ago we read in a well known trade paper an ad-

vertisement something like this:

"WANTED—Situation as Head Gardener or Superintendent on gentleman's country estate. Life experience in all branches of horticulture. First-class references. Age 23."

Comment is needless, but this serves to show that some who enter the profession think it can be learned in a very short time. Fifteen years seems a long time to put in before one becomes a competent gardener, but many of our best men put in all that and some more before they get out on their own book, and they undoubtedly did a good deal of private study on subjects which are side issues so far as gardening itself is concerned, but which, nevertheless, are indispensable in the management of a country estate. The moral of all this is that there are too many "neglected opportunities" amongst the raw material from which the estate manager is recruited or should be recruited. After many of us have neglected our opportunities we become restless and dissatisfied and determine to start out for ourselves. A place turns up, and there are others like us who feel the same way, but there is the determination to have the job at even \$50, so on goes the price-cutting until the poor fellow has succeeded in persuading himself that he has at last made his mark and the emplover deluded into believing that he has engaged the services of

a competent man at low water rates.

The fact that such methods are resorted to needs only the evidence of the men who hold such low priced jobs and who, as Mr. Smith says, are only too well paid. These same men when they were assistants would have refused a place which would have afforded them a wide and useful field of experience if the wages were not at least \$5 per month more than they had in the previous place. So again we have to admit that as assistants we prefer wages to knowledge and experience. In Europe it is quite the custom to sacrifice wages to get to a place that has a reputation; in fact, to the British journeyman gardener, wages are a secondary consideration. Hence the success of the British

gardener.

In conclusion we want to say to Mr. Watson that we believe that the cause of low wages is incompetent gardeners, who have only themselves to blame for their incompetence. We believe, however, that there is some good old stuff among the boys yet, and, like many of our bosses, we only want a little encouragement and credit where it is due, to help us along, and we are prepared to listen, too—at least some of us.

AN ASSISTANT.

The above communications convey the right tone in them. They should be carefully read by the young men of the profession and the suggestions contained in them carefully pondered over. We know "A Young Member" and would like "An Assistant" to make himself known to us. We enjoy cultivating the acquaintance of young gardeners of the type which these writers express.— Editor.

#### A GARDENER'S GRIEVANCES.

DECEMBER 19, 1913.

Mr. M. C. Ebel, Sec. N. A. G.

Dear Sir: In your report at the annual convention at New York City, you invite suggestions from members for the benefit of the gardening profession. I should like to know, as one of the many in the profession who are desirous of the same information, and who would register in the ranks of the N. A. G.: "What

are the objects and benefits of the National Association of Gar-Every trade and professional society issues a copy of its constitutional by-laws to its members; this is the only so-

ciety that I know of that does not supply this want.

I find there are a large number of employees who are either ignorant, selfish or apathetic to the conditions and requirements of a gardener. Some of these I have had to contend with, others are from personal observation, and I have noticed that it is mostly the strangers who arrive in this country who are dumped mostly the strangers who arrive in this country who are dumped into these so-called positions. An employer expects a conscientious service from the gardener and in return he gives an unsanitary damp old shack; some are infested with vermin, some are situated in the environment of a large number of dogs, with the incessant howling at night and day, or accommodation in a pump house where the vibrating noise also creates another kind of music. Others defer paying their wages for two or three months. Some require all kinds of plants and vegetables grown in one small greenhouse, another will tell you that you have a few men under you, but the employer invariably instructs them what to do, and the employer being ignorant in the practical routine and methods of working, induces antagonism between the employer and the gardener. These are only a few causes and conditions provaled in this tions prevalent in this country, where a large number of employers merely "monkey" with competent men.

If, then, an association is formed for gardeners, it will have to be a protective society and assist in promoting their interest, dignity and the co-operation of its members, as well as educating

the employers what a gardener should do and receive.

Yours truly.

FREDERICK LISTON.

DECEMBER 29, 1913.

Mr. Martin C. Ebel, Secretary, N. A. G.

I respectfully thank you for your reply to my letter of the 19th inst. and I should fully appreciate it if you publish it in the CHRONICLE, as it may be the means of producing a ventilation on the conditions prevalent in this country amongst the profession of gardeners.

I am glad to hear the association's object is to elevate the profession of gardening, but until I receive a copy of the rules and constitutional by-laws of the N. A. G., I shall have to reserve my opinion as to the merits or demerits likely to be accomplished

through the efforts of the organization.
In reference to your question, viz.: "Whether conditions are really much worse here than they are in the European countries? If so, why do so many young men of the gardening profession

leave their home country to seek opportunities here?

In the first place, I can only speak on conditions prevalent in Great Britain. Now, sir, having tested both, I have no hesitation in saying that the working arrangements and conditions in that country are better than those prevailing here, although I admit this has only been brought about during recent years, thanks to the energetic efforts of the gardeners' association there, which not only protects and promotes the interest of the profession, but also extends a cordial co-operation with employers, and by a mutual understanding persuades them to give reasonable working conditions and compensation for competent service. In the second place, "the reason so many do not return to their home country" is owing to the congested state of the employment market, the number of acres of land which has ceased to be cultivated; consequently the law of supply and demand has affected the gardener as much as any one, together with political and plutocratic oppression and ostracism, are the chief, amongst other causes, why young men do not return. If England received the same amount of sun as this country, it would be an ideal Garden of Eden. In this country of England over 1,000,000 acres of land have gone out of cultivation during the last 35 years This has caused a large influx of cheap farm hands to invade the ranks of gardeners. I am aware that wages here are more than double those of the home country, but the privileges are nil when you compare the two, and very often a wife's services have to be included in the wages here as a caretaker, cook, butter maker, look after chickens and dogs, for the salary of \$50, accommodation and 2 quarts of "skim" milk.

I am aware that the employer who "pays the piper can demand the tune"; just so, and the piper who plays the tune can demand his payment. A conscientious and considerate employer would not hesitate to meet that demand. An employer is expected to give proper and respectful orders before he can expect to receive proper service, combined with the same courtesy and conscientious workmanship; an employer who is an overbearing boss and desires to show his rule because of his "greenbacks" is invariably not worth the consideration of a gardener. I am aware no association can dictate to employers on behalf of gardeners, but it can and should use, through its members, persuasive measures to ameliorate and adjust their grievances by an amicable concert.

You say. "A man that can afford the luxury of a gardener, etc." I take issue with you that a gardener is a luxury—a gardener is as much a necessary as a doctor, lawyer, teacher or

a farmer, for he belongs to the productive class of workers and therefore is a producer. Why don't you form branch associations in every State so that gardeners would have a meeting place to discuss these vital questions and also be able to receive a delegate from headquarters occasionally? I think this would be a good way of co-operation and more economical for the members, as they could reach the meeting in half a day, say, every two weeks.

Another point I would like to urge, viz., free advertising in the Chronicle for a position when out of employment, and if addressed at the office the members to pay postage only. would also be interesting to the members to have recorded in the CHRONICLE the details of the Executive meetings.

In conclusion I shall appreciate the publication of both my letters in the Chronicle if you have space at your disposal.

FREDERICK LISTON.

The above correspondence is published at this late date at the wish of the author, who feels that the chronicling of his views on gardening conditions in this country may aid to eliminate some of the unpleasant surroundings he has encountered. From my own observations I am afraid that his experience is an exceptional one and not the rule. There is only one solution to the problem what one should do when he encounters such an experience, and, that is, to seek a better opportunity and seize it when it presents itself. There is no law that binds one to an unsatisfactory employer or position. I am not personally familiar with conditions that govern gardeners abroad, but from what I have gathered among many gardeners, the relative conditions here and abroad being a subject of discussion which comes up frequently among them, it appears to me that the gardener in this country has much the best of it, both respecting the salary paid to him and his surroundings. M. C. EBEL, Sec'y N. A. G.

#### WHAT CAN YOU DO?

This old world hasn't time to stop That it may learn your name;

It doesn't care a rap about

Your blue blood or your fame; The only thing this old world cares About concerning you

Is simply this one thing, to wit: "Well, Sir, what can you do?"

So don't waste time in hunting up A useless pedigree;

And don't bewail the fact that you Are not an LL.D.

But when the old world stops to ask: "Well, Sir, what can you do?"

Just roll your sleeves up elbow high And say, "Well, I'll show you!"

—Columbus (Ohio) State Journal.

"While you're standing looking over the fence to see how your neighbor's morals are stunted in growth, you had better be getting a hoe and chopping some of the weeds out of your own.'

#### GROWING STRAWBERRIES IN HILLS.

By F. M. SHERMAN.

When I say that strawberies will be at their best only when grown in hills, I know there will be many who will disagree with me. But I have found the hill system the most satisfactory, not only here in my present location in Oregon, but in several of the mid-western states as well. The only variety with which I have not found the hill system to be entirely satisfactory is the Excelsior, although there may be many more, which must be determined by experimenting with each variety separately.

I find the first thing is to determine the variety best adapted to the soil and climatic conditions. This will ofttimes be found to be a different variety from one which may be grown very successfully only a few miles away. Having done this, I put the plot into the very finest condition physically; if the piece is already in so-called garden condition, it saves much time, because this is the shape it should be in before the plants are set.

As to fertilizer, I have not found it necessary to apply anything of this kind, but have tried several experiments, both with the commercial and barnyard varieties. On my soil the results have been rather indifferent, as it seems to be well adapted to the growth of the strawberry. It is a sand to sandy loam and quite acid.

It may be well here to add a word of caution to the grower who lives in the alkaline soil districts, that if the soil conditions are such as many I have known, it is not at all practical to attempt to grow strawberries.

There is not the slightest danger of getting the soil in too fine a condition. In planting strawberries it is much better and easier to take plenty of time to get the soil in good condition and free from all weeds.

In setting the plants, where a field is large, I have found a plant setter to have many advantages, but the average grower will be able to set all he will have by hand, which, though slower, is as effective.

In setting, trim both tops and roots, leaving not more than three leaves, and cut the roots not longer than three and one-half inches. Do not hesitate to prune the roots back, as, by doing this, you are more certain to get results than if you had left the entire root on each plant.

In setting, care must be taken to reef the crown slightly above the top of the ground so it will not be covered later when cultivating, and still they must not project much above the level of the surface of the soil. Cultivation should begin at once, and be continued at least once every two weeks until the weather puts a stop to all growth in the autumn.

During the first season all runners and blossoms must be kept off the plants. This may necessitate cutting from five to eight times during the season, but this is earily done with a common pair of old or discarded scissors, which saves much stooping and is the best and most rapid tool which we have ever used, though some growers insist that a knife is better.

In the case of the strawberry when we cut off those blossoms, stalks and runners, each time we force the plant to start new crowns, until by the end of the season, we have more crowns formed than had we let them go to runners. Each of the buds formed is stronger, and has more vitality than little weak plants can show. Besides, we have the advantage of room for cultivation to conserve the soil moisture.

As soon as the soil is in condition the second season, the cultivation is begun and continued until the fruit sets. After this time the cultivation will cause too much trouble from dirty fruit.

As soon as a crop is harvested, cut the tops with a sharp hoe, then rake them up and burn. Cut tops at once or get a short crop later. This is one of the secrets of success with the hill system.

After years of practical experience, the growers of this district have demonstrated that the best yields of strawberries are obtained when the plants are set at three and one-half to four feet by eighteen inches between hills. This gives best yields, color and quality, and the plants are much easier to handle when picking and cultivating.

When picking strawberries for exhibition, we are careful never to touch a berry with our fingers, and select only the very smoothest and finest colored fruits, which are of a medium, uniform size, and more particularly a single shade of color.—From Fruit Grower.

#### CHINESE GRAFTED CHRYSANTHEMUMS.

Bulletin 92 of the Office of Foreign Seed and Plant Introduction reports on a species of Artemisia (wormwood) from Peking, China, which is thus described:

A biennial wormwood, occurring as a weed on all sorts of dry, waste places. The Chinese utilize this plant as a stock to graft Chrysanthemums upon, and claim that "mums" thus grafted are earlier, need less water and no manure, are more easily lifted and transplanted, and in general require far less care than when on their own roots. To obtain the best results the Chinese sow the seed in late summer in well-drained beds. germinate quickly, but the little plants make but very small growth during the autumn and winter. spring is there, however, they develop with great vigor. and in June they have well-formed stems. Now the Chinese cut off the main stem an inch or so from the ground and graft a Chrysanthemum scion upon it by the ordinary cleft-graft method; no wax is used, but only a small strip of fiber, while the plants are shaded during the first days. The stock and the scion soon unite and continue to grow vigorously. On very strongly developed specimens of stock the main branches are often used to insert on every one a different variety of Chrysanthemum or to train a beautiful "standard" tree of it, and some of such specimens are fully as good as the plants seen at home exhibitions of "mums." The above described method of grafting Chrysanthemums might prove to be valuable for the sections of the United States where the summers are somewhat too short or the nights too cool to rear the plants successfully out of doors, as, for instance, in the more elevated parts of the Rocky Mountain states. Care has to be taken in watering the plants sparingly when lifted and planted in flower pots.

#### JULY.

Journeying Time, if in thy power,
Tell who stays the earth in motion,
Formed life and light, tree and flower,
Timed the ebb and flow of ocean?

Unlock for us Mystery's dark tower.

Was germ or spirit life's origin?

Lead Science in her struggling hour

To solve the mystery of Creation.

Thy great forebears no doubt could tell— They saw this planet spick and span; They witnessed, too, the sea's first swell, And knew of Nature's secret plan.

Ah! Time, you've kept the secret well: Yield now the long-hid truth to man.

-David S. Miller.

#### TRAINING WALL FRUIT TREES.

Cordon fruit trees become increasingly popular each year, and the reason is not far to seek, for such trees are easily managed, while space is economised to the greatest extent. The early training of the trees is usually carried out in the nursery, and when the cordons leave the nursery they should not only possess main stems as straight as gun-rods, but also be furnished almost to the ground-level with fruiting spurs. If good trees are procured from the nursery in the first place, it then requires only common-sense methods to retain those trees well trained in one's own garden. Speaking generally, cordons should be planted obliquely. The reason for planting them on the slope is that a greater extension can be given to the leaders, which should not be carried above the top of the wall. Vertical cordons should only be placed against high walls or pillars, and even then over-vigorous varieties should not be planted. A point worth noting in planting cordons is that the more pronounced the incline, the further apart should the trees be placed. Double cordons or U-shaped trees are sometimes preferred, and occasionally one sees a wall planted with triple cordons; but for all practical purposes the single cordon gives the best result. Horizontal cordons, with low branches about one foot from the soil and trained parallel to the ground, are favoured for forming edgings to borders. Growth, however, is so restricted that trees trained in this manner rarely live for very many years. Slow-growing Apples and Paradise stock are best suited for horizontal cordons. The horizontal trained tree, with branches arranged tier upon tier, is one of the best form of trained trees for planting against walls. Should the branches on one side of the tree grow at the expense of those on the opposite side, the vigorous branches should be tied down temporarily. This will weaken them, while the weak branches may be strengthened by being raised. Much may also be said in favor of the fan-trained tree, particularly with such fruits as Cherries, Peaches, Nectarines and Apricots. The Pear, however, is one of the easiest trees to train, and will do equally well as a cordon, either single or double or horizontally trained. other type of wall tree worthy of note is the trained standard fan. Obviously it is only suited to very high walls or buildings. On the Continent it is regarded as a lucrative way of covering the upper part of one's

In pruning trained trees, Apple, Pear and Plum, the object should be to make every branch a cordon, with fruit spurs along the entire length of the branch, "Once a fruit spur always a fruit spur" is an old saying among fruit-growers. In order to secure fruiting spurs it is necessary to prune hard the second season after planting, and the following season the resultant vigorous growth should be shortened to about one-third its length. Summer pruning is important. It is accomplished by pruning or pinching back lateral growths to the extent of about 4 inches in July. This should be annually followed by winter pruning, when the side growths are cut back to two or three eyes. The fruiting spurs should, of course, never be pruned. With horizontal trained trees the leader should be cut back to within a foot of the top horizontal tier, and with cordons it may be shortened in proportion.

Unlike the Apple and Pear, Peach and Nectarine trees fruit upon the young wood, and not on fruiting spurs. The main shoots should be shortened about one foot in winter, and overcrowded growths thinned to the base. The young or fruiting wood should be re-

tained and laid in on the upper side of the leaders only. This will ensure uniformity in fan-shaped trees and avoid the crossing of branches.

The work of planting is best carried out in the autumn, but it may be successfully accomplished at any time when growth is dormant, providing, of course, that the weather is open and that the soil may be readily worked. It is a common mistake to over-manure the soil at the time of planting. Providing that the soil has been previously worked, very little, if any, manure need be applied, and even then only well-rotted manure should be incorporated with the soil. In cases where the soil is deficient in lime, the addition of a little lime rubble around the roots of each tree will prove highly beneficial; in fact, the value of lime rubble for fruit trees generally cannot be overrated. When planting trained trees against walls, the base of the trees should be brought about 10 inches forward away from the wall.—The Garden.

#### EDELWEISS IN AMERICAN GARDENS.

By John W. Coates, Jr.

The interest in edelweiss has been greatly accentuated because of the rarity of the little flowers. They are indigenous to the Alpine regions and, according to the prevalent belief, grow only in almost inaccessible places. So general is this opinion that even an accomplished Alpine mountaineer in writing of the edelweiss says, "Strangely enough, it always grows in a spot to be reached only with the utmost peril. You will see a tuft of its beautifully white flowers overhanging a precipice, or waving on a perpendicular wall of rock, to be approached but by a leap, where perhaps a chamois could hardly stand."

This statement covers the general belief as to the nature of edelweiss. The natives of the Tyrol and Bavaria have reaped a rich harvest through the sale of the flowers to tourists, who buy them as souvenirs of the Alps, apparently believing that each of the little flowers has been gained only at the risk of human lives and limbs. Thus the native profits by a theory that is decidedly erroneous.

Edelweiss, it is true, does frequently grow in places dangerous of access, but it is also true that many clumps of the dainty, woolly flowers are found growing thickly on broad pasture slopes in parts of the Tyrol and Bavaria. There never has been an abundance of them, but it is a poor day when one does not discover two or three of these clumps of edelweiss in a day's climb.

In America, until recent years, comparatively few people have known the edelweiss by sight, their only acquaintance being with the dried, pressed specimens imported as souvenirs. The fresh edelweiss has been an unknown flower to the stay-at-home American. Within the last few years, however, it has been grown in this country by many people. One of those who have been particularly successful with it is Mr. Louis Ettlinger, whose home is the old Henry Ward Beecher place at Peekskill, New York.

While touring in Switzerland, several years ago, Mr. Ettlinger secured a packet of the genuine Swiss edelweiss seeds, and on his return to America planted them in his hothouse. The following spring, in early May, the plants were set out in a shady, cool part of the flower garden, and their growth watched carefully. That season, however, the plants struggled along without blooming at all successfully, and it was decided to try again the following year.

In the first planting, Mr. Ettlinger had tried to keep the plants in as cool a place as possible, believing that they would grow better under conditions nearly like that of their native country; but in the second season they were set out in an open, sunny part of the garden, planted at distances of one or two feet, and cared for just as the other parts of the garden were cared for.

The flower of cold weather and of mountains thrived and bloomed abundantly all through the hot summer under a blazing sun.

Since that time the edelweiss have appeared each spring in the early part of May, and toward the end of the month have put forth flowers which remained in bloom until along in September. There has been no further bother with hothouse culture and cultivation; the plants have become naturalized and in their hardy way have inured themselves to the hardships of the new soil. They fill an interesting place in a garden full of interesting flowers.

"It is a low plant, four to twelve inches high, densely covered with a whitish wool, the attractive portion being the flat, star-like cluster of woolly floral leaves surrounding the true flowers, which are small, inconspicuous and yellow," says "Bailey's Cyclopedia of Horticulture" in describing the edelweiss. Various directions are given by authorities for the culture of the Alpine flower. One says, "It can be grown to perfection in elevated position of the rockery, in rather light soil and with full exposure to the sun. It also succeeds in an ordinary hardy border where the plants can be kept moderately dry in winter." Another advises that the seed be sown early in spring in shallow pans of sandy soil and leafmold and kept cool and moist. An English writer advises that a few stray seedlings be firmly planted in a narrow chink of rock, so placed that a deep fissure of gritty or sandy loam may be assured for the roots to ramble in. Plants in pots may be grown and flowered when the collar is tightly wedged between some pieces of stone or old mortar. The plant is best propagated by seeds, as division is not always successful.

The more poetic name of edelweiss means "noble white," and expresses the sentiment of the Alpine natives toward the flower as an emblem of purity.

The odd little plant has long had a place in English gardens; its cultivation is not difficult on sandy soils, or even as a border plant, and it grows, too, luxuriantly in moist, rich soils."

Gardeners who wish to grow something that is more or less of a novelty will find edelweiss an interesting plant with which to experiment. Most of our American seedsmen catalogue it.—From Suburban Life.

# RAILWAY GARDENING ASSOCIATION CONVENTION.

The eighth annual convention of the Railway Gardening Association will be held in New York City, August 11 to 14, at the Hotel Breslin, Broadway and Twentyninth street.

#### PROGRAM.

#### TUESDAY, AUGUST 11.

10:00 a. m. to 12:30 p. m.—Opening meeting. 2:30 p. m. to 5:00 p. m.—Business meeting. If necessary, part of the evening will be devoted to business meeting.

#### WEDNESDAY, AUGUST 12.

9:00 a. m. to 12:00 m.—Business meeting. 2:00 p. m. to 5:00 p. m.—Business meeting. Evening.—Go as you please.

#### THUESDAY, AUGUST 13.

9:00 a. m.—Eusiness meeting, election of officers, etc.

1:00 p. m.—Trip on Central Railroad of New Jersey to Somerville and Dukes Farms and Gardens, stopping en route to have photo of party taken by Mr. Morris at Fanwood Station.

#### FRIDAY, AUGUST 14.

9:00 a. m.—Trip to Ocean Grove via Sandy Hook boats and train, compliments of Central Railroad of New Jersey.

Afternoon.—To Coney Island or suit individual tastes.

Members are requested to kindly advise President F.
W. Vail, of Dunellin, N. J., at the earliest possible moment whether they are going to attend, so that he can complete the program for all business and social features.

#### THE OLDEST CHEMICAL FERTILIZER.

BY KARL LANGENBECK.

The beneficial results of applying a variety of chemicals to the soil is an old experience in agriculture. Gypsum or crude plaster, marl, a form of carbonate of lime, with more or less of clay admixture, chalk, crushed limestone and the road dust of roads running through a lime country were used indiscriminately just as they were available. In districts distant from such materials, the plastering, stucco and mortar of old buildings that were pulled down was not wasted. They were applied to the gardens and farms near the villages and towns of England in the days of bluff Prince Hal.

We are speaking, of course, of old countries, where the keeping up of the fertility of the land has been a constant problem. And, this is a problem we still have to learn in America, where virgin fertility is still so recent a tradition, if not an experienced fact with many, that farmers are slow to keep alive to its necessity.

Now, rural England, the home of our mother tongue, called all these various forms of chemicals by the general term "lime." "Liming the soil" meant applying any one or other of them, whichever was cheapest or easiest available. But it was also known, that if results were wanted in shorter time, burned lime such as used for mortar was best. It was, therefore, designated "quick lime" for "quick" meant alive in old English and "lime" an earthy chemical.

"Quicklime" is the good old English name for burned lime. It got it from the farmer from the way it did its work-quick. As there were always more farmers than masons, their designation had the call, and in the English of England, "burned lime" would not be understood for what it is by the generality of men, for "quicklime" is the word. Now, it would be well for our farmers to remember this, for it tells the story of age long experience in a word. But, how is it that here in America we have lost the designation and do not, as in the mother tongue, understand by lime, a class of substance and the particular thing by "quicklime." Why, very naturally. Favored in agriculture by fertile soil, the American farmer forgot about fertilizing it with different chemicals. "Quicklime" became virtually a material of the mason alone. The designation "quick" was therefore dropped because it was considered senseless.

So, in American English, we know of lime as a particular thing. We have lost the farmers' term "quick-lime" for the most active of lime derived chemicals. We hope American farmers will revive the expressive old English term

#### MASSACHUSETTS HORTICULTURAL SOCI-ETY EXHIBITIONS.

RHODODENDRON SHOW, JUNE 13-14,

What has been termed the Rhododendron Show for many years was held on June 13-14. The date proved too late for these flowers, however, and few were shown. Long tables of cut rhododendrons are at best far from interesting. What should be encouraged is the exhibition of large specimens in tubs for which substantial prizes must be offered. Other flowers made a splendid show. Peonies were extensively shown by R. & J. Farquhar & Co., Wellesley Nurseries, T. C. Thurlow Sons Co., James McKissock, William Thatcher, gardener to Mrs. J. L. Gardener; Martin Sullivan, gardener to Wm. Whitman; Dr. C. S. Minot, Geo. W. Page, gardener to Mrs. Frederick Ayer, and T. D. Hatfield, gardener to Walter Hunnewell. Large displays of German Irises came from T. C. Thurlow Sons Co., E. M. Dumple, J. K. Alexander and others.

William Thatcher captured both first and second for the best display of orchid plants. H. Stewart, gardener to Miss Cornelia Warren, showed a table of grandly flowered plants of the old Oncidium flexuosum, carrying 50 to 75 spikes each. R. & J. Farquhar & Co. received a silver medal for a beautiful group of herbaceous flowers. Mount Desert Nurseries had an imposing bank of perennials. Alexander McKay, gardener to E. A. Clark, had a fine specimen of Dendrobium thrysiflorum. were also numerous other exhibits of seasonable flowers.

#### PEONY SHOW, JUNE 20-21.

The leading peony exhibitors at the show on June 20-21 were T. C. Thurlow Sons Co., James McKissock, J. L. Smith, gardener to A. W. Preston; H. F. Chase, Martin Sullivan, Wellesley Nurseries, Dr. C. S. Minot, J. K. Alexander and R. & J. Farquhar & Co. The Mount Desert Nurseries received a medal for a fine display of herbaceous flowers. Large displays came also from R. & J. Farquhar & Co., Old Town Nurseries, Eastern Nurseries and others. Wheeler & Co. received a certificate for fine specimens of Dendrobium formosum. Jackson Dawson, of the Arnold Arboretum had an interesting collection of seedling roses on exhibition.

#### ROSE AND STRAWBERRY SHOW, JUNE 27-28.

The Rose and Strawberry show came a little late, but was an excellent show, more than filling the main exhibition hall. Hybrid teas were shown in better numbers than ever before. They attracted considerably more attention than hybrid perpetuals, although the latter still have hosts of admirers owing to their greater vigor and hardiness

M. H. Walsh, Woods Hole, was the largest and one of the most successful rose exhibitors. Others who made fine showings were: J. L. Smith, J. D. Gorden, gardener to Thomas N. Cook; George Page; George Barker, gardener to A. F. Estabrook; E. L. Lewis, gardener to Col. Frederick Mason, and Martin Sullivan. The Mount Desert Nurseries and R. & J. Farquhar each received silver medals for grand herbaceous collections. Jackson Dawson, with a fine collection of seedling roses, and H. Stewart, with a group of hydrangeas, together with some other exhibits, made the show varied and interesting.

Strawberries were in excellent shape, Marshall once more proving to be the winning variety. William Davis, gardener to E. S. Webster, had the best dishes of strawberries, Golden Gate and Barrymore being Marshall's nearest competitors.

, SWEET PEA SHOW, JULY 11-12.

The exhibition hall was well filled on the occasion of

the annual Sweet Pea Show, and the quality of the sweet peas, owing to recent rains and the absence of heat waves, was excellent. Each of the twenty-seven classes brought out good competition. The leading prize winners were Wm. Gray, gardener to Mrs. Wm. B. Leeds, Newport, R. I.; E. H. Wetterlow, gardener to Mrs. Lester Leland, Manchester, Mass.; George Melvin, gardener to Col. Chas. Phaff, South Framingham, Mass.; Miss Fannie Foster, Newport, R. I., and Mrs. P. J.

Exhibits of delphiniums from Mrs. J. M. Sears and Martin Sullivan were fine. E. H. Wetterlow received a cultural certificate for a dozen finely flowered achimenes. H. Stewart had a display of gloxinias, hydrangeas, herbaceous flowers, etc. William Thatcher showed Clero-

dendron fallax and Platyclinis filiformis.

Vegetables were of good quality. For twelve varieties arranged for effect there were six entries. The prize winnrs were: J. O. Christensen, gardener to W. J. Clemsen, Edward Parker, gardener to Oliver Ames, and E. L. Lewis.

#### ANNUAL CONVENTION OF PARK SUPER-INTENDENTS.

The sixteenth annual convention of the American Association of Park Superintendents will be held at Newburgh and New York City, N. Y., August 24, 25, 26 and 27, 1914. Headquarters: Newburgh, Palatine Hotel; New York City, Hotel Astor.

#### Program.

#### MONDAY, AUGUST 24.

3 p. m.-Meeting of the Executive Board. Registra-

tion (Newburgh).

7:30 p. m.—Annual business meeting at headquarters, Palatine Hotel, Newburgh, N. Y. Address of welcome, Mayor of Newburgh; addresses by the Park Commissioners of Newburgh; response, President H. S. Richards. A brief sketch of the life and works of Mr. Andrew Jackson Downing, by Prof. F. A. Waugh. "The Preservation of Natural Woodlands Under Park Conditions," illustrated lecture and discussion led by Ogelsby

#### TUESDAY, AUGUST 25.

7 to 10 a. m.—Visit to Mt. Beacon.

10 a. m.—Start by auto from headquarters at Newburgh to see the important points of interest in the city, and Newburgh parks and playgrounds; thence through Tuxedo Valley to Tuxedo Park. The association will then be entertained at luncheon by Mrs. E. H. Harriman on her estate at Arden. Return to Newburgh early in the evening.

#### WEDNESDAY, AUGUST 26.

10 a. m.—Through the courtesy of Hon. George W. Perkins, president of the Interstate Park Commission, the association will leave Newburgh by boat on a trip down the Hudson River to West Point, stopping at the different points along the Interstate Park river front, where the members and their guests will be conveyed through the Interstate Park. The trip by boat down the Hudson will then be continued, arriving in New York City early in the evening.

#### THURSDAY, AUGUST 27.

9 a. m.—Meet at headquarters, Hotel Astor, New York City. Address of welcome, Mayor of the City of New York; address, Hon, Cabot Ward, president of New York Park Board; response, President H. S. Richards.

#### QUERIES and ANSWERS

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.
Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

I would like to ask some of your readers which varieties of trained peach trees are the best to grow on walls outside; also can nectarines be grown that way and finished good? Are the English varieties of peaches and nectarines, the same as we force in the greenhouse, all right for that purpose?—H.

Regarding the question asked in your June number about peaches and nectarines for outside growing, we have the following varieties, growing outside, trained on a wall-Thomas Rivers, Diamond, Dr. Hogg, Royal George, Crimson Galande, Hales Early and Crawford's Early. They have fruited splendidly every year until the present, but last winter being so cold, all the fruit buds were killed, not only on these trees but on all the peach trees around this part of the country.

We put a burlap curtain hung on wires in front of them in the early spring, more as a protection against late frosts, when they are in bloom, than any winter protection. We slide these curtains along during the day and tie them between every second tree. We were told when we planted them we would never get a peach on account of the hot weather in the summer, but we have not had any trouble that way so far, and they make splendid growth during the summer. Regarding the nectarines: we have a tree of Rivers oranges, growing well on a wall. C. Gattrell, Newburyport, Mass.

I have some Costess blue spruce, about ten feet high. From midway up they do not spread out in what some people would call in proportion. What is the best way to develop them-pinching in the tops of all side branches, or cutting out, say eighteen inches of the leads?—J. J. O. Mass.

Replying to question about regaining symmetry in Blue Spruce. In July pinch back about half way, the lateral leaders of the current year's growth, from the lower half of the tree, leaving those of the upper half practically untouched. Continue this for a season or two until the tree regains its symmetry. Then the upper half can be pinched back or summer pruned, as this process is often called, to encourage thickening. It will take two or three years to accomplish what is desired.

As a rule it is not wise to prune back the central leaders unless it is very vigorous, when it can be pinched back to encourage lateral shoots to burst out.

Give the trees a good mulching of well decayed manure. Following transplanting, there is occasionally a lack of symmetry, but in time, under good care, this will be regained.- J. F. J.

#### NASSAU COUNTY HORTICULTURAL SOCIETY ANNUAL ROSE SHOW.

The annual rose show of the Nassau County Horticultural Society was held at the Nassau County Club by kind permission of the governors of the club on Tuesday, June 16. Owing to the international polo match being on the same day the attendance was not so large as on the two previous years, but there was a grand display of roses, sweet peas, perennials, vegetables and fruit, but the entries were not quite so many this year, as a lot of the best H. T. or tea roses were past the perfection mark, the hot sun and drying winds of the past week having been very hard

# A Bright New Book of 182 Pages for 1914

Telling the Plain Truth about BURPEE-QUALITY SEEDS, is mailed Free of Cost to Gardeners everywhere upon Application to W. ATLEE BURPEE & CO., Burpee Buildings, Philadelphia

The judges were James Duthie and Fred Kirkham, of Oyster Bay, and William Gray, of Glen Cove. The schedule and awards were as follows:

Class 1. Best collection of outdoor roses, 25 varieties, 3 flowers of each—John T. Pratt (J. W. Everitt, gardener), first; Harvey S. Ladew (Joseph Adler, gardener), second. Class 2. Twelve distinct varieties. H. P. roses, 3 of each-W. E. Kimball (James McCarthy, gardener), first. Class 3. Twelve distinct varieties of H. T. or tea roses, 3 of each—H. L. Pratt (Henry Gaut, gardener), first; W. E. Kimball second. Class 4. Six distinct varieties, H. P. roses, 3 of each-Paul Dana (James Gladstone, gardener), first; W. E. Kimball, second. Class 5. Six distinct varieties, H. T. or tea roses, 3 of each—C. F. Cartledge (W. Noonan, gardener), first; Mrs. J. C. Ayer (Harry Jones, gardener), second. Class 6. Vase of 12 H. P. roses, 1 variety—C. F. Cartledge, first; Paul Dana, second. Class Vase of 12 H. T. or tea roses, 1 variety -H. L. Pratt, first; Mrs. F. S. Smithers (Valentine Cleres, gardener), second. Class Vase of 12 roses, assorted varieties-Mrs. J. C. Ayer, first; W. E. Kimball, second. Class 9. Twelve sprays rambler roses, any color—Mrs. F. S. Smithers, first.

#### Out-Door Flowers.

Class 10. Collection of hardy perennials, 25 varieties, no bulbs—H. L. Pratt, first. Class 11—Collection hardy perennials, 25 varieties—H. L. Pratt, first. Class 12. Six vases annuals, 1 variety in a vase—H. L. Pratt, first. Class 13. vases sweet peas, 6 varieties, 25 sprays each-Mrs. Benjamin Stern (Herman Gold, gardener), first; H. L. Pratt, second. Class 14. One vase sweet peas, 25 sprays-H. L. Pratt, first; C. F. Cartledge, second. Class 15. Vase of peonies, 12 flowers—Mrs. J. C. Ayer, first; W. V. Hester (Herman Boettcher, gardener), second. Class 17. Vase of delphinium, 12 spikes—Paul Dana, first; Harvey S. Ladew, second. Class 18. Vase digitalis, 12 spikes—W. E. Kimball, first; Paul Dana, second. Class 20. Vase, cut flowering tree or shrub-Mrs. J. C. Ayer, first; W. E. Kimball, second.

#### Vegetables.

Class 21. Collection 12 kinds vegetables (A. G. Hodenpyle Special)—H. L. Pratt, first; Percy Chubb (Frank Honeyman. gardener), second. Class 22. Collection of 6 vegetables grown outdoors-A. G. Hodenpyle (Frank Petroccia, gardener), first. Class 23. Twenty-five pods peas—Paul Dana, first; A. G. Hodenpyle, second. Class 24. Three heads cauliflower-A. G. Hoden- pyle, first. Class 25. Three heads lettuce
 W. V. Hester, first; Mrs. F. S. Smithers. second. Class 26. One bunch asparagus— Mrs. C. D. Smithers, first; A. G. Hodenpyle, second.

#### Fruit.

Class 27. Twelve largest strawberries— Mrs. F. S. Smithers, first; Mrs. C. D. Smithers, second. Class 28. Six varieties strawberries, 12 of each-Howard C. Smith (Alfred Walker, gardener), first; J. T. James Macdonald was manager of the outdoor fruit—A. G. Hodenpyle, first.

#### Table Decoration.

Class 30. Best table decoration, table set for six persons-Percy Chubb, with a table of sweet peas, spirea and maiden hair fern, first; Mrs. J. C. Ayer (Harry Jones, gardener), with a table of Mrs. Aaron Ward roses, second. HARRY JONES, Secretary.

#### WESTCHESTER AND FAIRFIELD HOR-TICULTURAL SOCIETY SHOW.

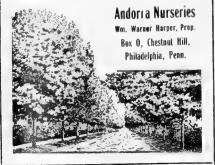

A remarkably fine exhibition of flowers, fruits, vegetables, etc., was held by this society June 19-20, on the beautiful grounds of the United Hospital at Portchester, A large and commodious tent was erected by the hospital management directly over a large artificial lily pond, a permanent feature of the grounds, and which formed a fine central feature, and setting for the exhibition. There was a good attendance and the society gained many new friends. Everything exhibited was of the very best quality. There was keen competition in all classes and the entries were very numerous. Remarkable displays of sweet peas were in evidence, both indoor and outdoor grown, and the keenest rivalry existed in these classes. The roses were also remarkable for their fine quality and were exhibited in great numbers. wonderful white rose Frau Karl Druschkii was shown in grand form, while several very fine vases were entered in the special class for twelve blooms of this variety.

A number of novelties were noted in the various collections of plants, etc. The new hardy shrub Salvia Greggi was exhibited and should prove of value and a welcome addition to the list of shrubs, as the crimson shade blends harmoniously with the

## THEANDORRAWAY

f growing Trees and Shrubs is to cultivate and recultivate, thus conserving the soil moisture during the hot months and helping the specimens to retain all the vigor that nature and expert attention give to trees and plants grown the Andorra Way.

See Andorra when on your vacation trip. Come by motor, by train, or by trolley. Andorra is a complete planting of splendid specimens, that can be re-moved with safety and will add beauty to the surroundings of any home. Write for our planting booklet, and for advice and assistance in your landscaping

that are in season at this time.

Two new hardy nympheas were noted in the display, namely, N. Escarboucle and N. Attraction, and both are very fine varieties and welcome additions to the already long list of this class.

A noteworthy feature of the exhibition was a collection of 18 varieties of Spencer type sweet peas from John I. Downey. Portchester, N. Y. (Thos. Ryan, gardener), who was awarded a certificate of merit for the exhibit.

A very fine exhibit of Sweet William was exhibited by Wm. Shillaker, Essex Falls, N. J. (J. P. Sorenson, gardener). This oldtime flower is always popular, and may be enjoyed by the rich and poor alike. cultural certificate was awarded the display.

The class for floral decoration of a dinner table, seating eight persons, was a charming feature of the show. The first prize was awarded to Joseph Lovie, Mamaroneck, N. Y., for a very dainty and artistically arranged combination of sweet peas and adiantum foliage; second prize being awarded to Fred Lagerstam, of Greenwich, Conn., for an arrangement of rambler roses, and the third prize was carried off by a clever arrangement of deutzia candidissima used in combination with Henchera Sangunia. by James Linane, Rye. N. Y. All the tables were well arranged and showed very plainly the gardeners' ability to do decorative work in connection with his calling.

The awards of the judges in the other competitive classes are as follows:

Roses.—Collection H. P. roses, 12 varieties of 3 each; Mrs. A. P. Stokes, Morton, Conn. 1st; Mr. G. D. Barron, Rye, N. Y. (Jas. Linane, gardener), 2d. Collection II. P. roses, 6 varieties, 3 each; E. C. Benedict, Greenwich, Conn. (Robt. Allen, gardener), Greenwich, Conn. (Robt. Allen, gardener), first; Mrs. Henry Schaefer, Greenwich, Conn. (Edw. Stumpf, gardener), 3rd. Vase of assorted H. P. roses; Mrs. F. A. Constable, Mamaroneck, N. Y. (Jas. Stuart, gardener), 1st; G. D. Baron, 2d; Mrs. Wm. G. Nichols, Rye, N. Y. (John McAllister, gardener), 3rd. Collection H. T. roses, 12 varieties, 3 each; Mrs. A. P. Stokes, Newvarieties, 3 each; Mrs. A. P. Stokes, Newton, Conn. (A. Whitelaw, gardener), 1st; Mrs. H. S. Bowen, Greenwich, Conn. (John Watts, gardener), 2d. Vase of roses arranged for effect: Robt. Mallory, Port-chester. N. Y. (Wm. Smith, gardener), 1st: Robert Grunnert, Greenwich, Conn., 2d; C. T. Willis, Greenwich, Coun. (Martin Glendon. gardener), 3rd. Best collection roses to cover 50 sq. ft. floor space: H. Darlington, Mamaroneck, N. Y. (P. W. Popp, gardener). 1st. Best 12 blooms Frau Karl Druschkii roses: H. Darlington, 1st; Mrs. Wm, G. Nichols, 2nd; Robt, Grunnert, 3rd. Best collection hardy flowers, 10 species: Mrs. F. A. Constable, 1st; Robt. Mallory, 2d; H. Darlington, 3rd. Best collection hardy flowers, 9 species: Robt. Mallory. Mrs. A. A. Anderson, Greenwich, Conn. (Robt. Williams, gardener). 2d; Mrs. J. E. Rantz Rees, Greenwich, Conn. Dell, gardener), 3rd. Collection flowers cut from hardy shrubs, 12 varieties; G. D. Barron, 1st; Mrs. I. C. Bruce, Greenwich. Conn. (John Andrew, gardener), 2d; II. Darlington, 3rd.

Sweet Peas. Best collection 18 varieties 25 sprays each: D. G. Reid, Irvington-on-Hudson, 1st. Collection sweet peas, 12 variudison, 1st. Conection sweet peas, 12 varieties, 25 sprays each; D. G. Reid, 1st. Collection, 6 varieties, 15 sprays each; Mrs. A. A. Anderson, 1st; Mrs. C. A. Gould, Portchester, N. Y. (W. H. Watermoneki, gardener), 2d; Mrs. F. A. Constable, 3rd. Miscellaneous.—Best pair of palms: Mrs. F. A. Constable, 1st; Mrs. A. A. Anderson, 2d. Best specimen: Mrs. G. F. Chamberlain. 1st; Mrs. F. A. Constable, 2d. Best foliage plant other than palms: Mrs. F. stable, 1st; John I. Downey, 2d. Hydrangeas, best pair: Chas. Mellon, 1st; G. D. Barron, 2d. Best specimen: John I. Lowney, 1st. Best pair not over 10-inch posts: Chas. Mallory, 1st. Best three fuchsia plants: Chas. Mallory, 1st: Mrs. F. A. Constable, 2d. Best six gloxinias: Mrs. A. A. Anderson, 1st; G. D. Barron, 2d. Best six tuberous begonias: Mrs. A. A. Anderson, 1st; Robt. Grunnert. 2d. P. W. POPP, Secretary.

#### JUNE SHOW, NEWPORT, R. I.

The grounds of Senator George Peabody Wetmore, where the second annual exhibition under the joint auspices of the Newport Garden Association and Horticultural Society was held, proved to be ad mirably adapted for flower show purposes. The general layout was planned by H. W. II. Powell, of this city, and worked very well. The entries staged were sufficient to enable the committee to carry out the plan in a satisfactory way. Two tents, placed some distance apart on the south side of the lot, were sufficient to accommodate greenhouse foliage and flowering plants, alse a part of the cut flower display, among which was a big entry of roses; these were the grandest lot ever staged here at this season of the year. Killarney Queen attracted much attention by its fine bright

The groups of plants were of good quality, but staged mostly after the old style; only one exhibitor had the courage to break away and set up in a natural man ner. In flowering plants, Calceolarias and Schizanthuses were leaders. The display of orchids in bloom was larger than ever. On the north side of the ground were two tents, one being for the cut flowers, the other for fruit and vegetables. Cut flowers were never seen in better form, especially

## GREENHOUSE SHADING

No. 6 High Street MORRISTOWN, N. J.

Here is what Mr. Fisher says:

Your shading is all O. K. Send 3 gals, more at once.

Yours truly.

R. FISHER, Bernardsville, N. J.

reds of perennials and biennials laid out in the grounds were all filled up with very well grown stock, which made a good showing. Among these were Delphinium, Digitalis, Campanula, Dianthus, Pansy, Viola, Snapdragon and Gladiolus.

Following is a list of the most important

first awards:

Bed canterbury bells, Mrs. H. M. Brooks; gardener, James Bond. Bed sweet william, James Bond. Bed stocks, Arthur Curtis James; gardener, John Gratrix. Bed antirrhinum, Mrs. W. W. Sherman; gardener. Andrew Ramsay. Bed bulbous plants, Mrs. French Vanderbilt; gardener, Daniel Hay. Tub sweet peas, Mrs. W. G. Weld: gardener, James Watt. Two beds violas, Andrew Ramsay. Display schizanthus, Vincent Astor; gardener, James Boyd. Bed hydrangeas, Oscar Schultz. Trained retinospora, Hugh Meikle. Bed roses, E. Kempenaar. Display topiary plants, Bobbink & Atkins. Gloxinias, Mrs. T. M. Davis; gar-Akins, Gloximas, Mrs. T. M. Davis; gardener, Victor May. Calceolarias, James Bond. Bed petunias, Andrew Ramsay. White reses, Mrs. W. B. Leeds; gardener, W. Gray. Yellow carnations, August Belmont; gardener, John Forbes. Jacqueminot roses, Miss Edith Wetmore. Group foliage plants. J. J. Van Allen; gardener, Richard Gardner, Ferns, James Bond, Table plants, James Bond, Display orchids, Paul de Nave, Specimen kentia, James Boyd, Specimen phoenix, James Boyd. Specimen palm, Mrs. H. McK. Twombly; gardener, Alexander Fraser. Specimen fern, James Bond. Group foliage and flowering plants for Hitchings & Co. silver cup, James Bond. Three orchids, Mrs. Stuart Duncan; gardener, W. McGillvary. Six tuberous plants; James Watt. Twelve pots annuals, James Bond.

In the cut rose section: C. M. Bugholt, J. B. Urquhait, W. Gray, Arthur Leary, Victor May, C. Robertson, Hugh William son, W. Mackay and John Forbes. Sweet peas: James Watt, Victor May, C. M. Bugholt, W. MacKay, F. P. Webber and Thomas Brook. Fruit: The firsts were G. Fraser, for black grapes; Victor May, for white grapes: James McLeish, nectarines; Daniel Hay, for three varieties of straw-

Alphano Humus Co. 17 G. Battery Place, New York tion of strawberries. Vegetables: J. B. Urquhart, winning a silver cup for twelve distinct kinds, and also a prize for six kinds.

Alex. Fraser was leader in centre-pieces specials and fancy baskets; a miniature Japanese flower garden, by Hugh Williamson; fruited grape vines in tubs, by W. MacKay.

The judges were, from the Garden Association-Miss Edith Wetmore, Henry S. Redmond, Ernest Howe; and from the Horticultural Society, Bruce Butterton, James Robertson and Andrew J. Dorward.

The dinner to the judges, workers and visiting exhibitors at the show was held at the "Bellvue" on Thursday evening, about thirty being present, and they enjoyed the repast tendered the society by H. A. C. Taylor, to whom our president, William Mackay, is gardener. The dinner over, President Mackay called upon many of those present for remarks. As manager, Joseph S. Manda spoke of the success of the show. C. H. Atkins spoke in a complimentary vein of what has been accomplished. Bruce Butterton, for the judges, commended the arrangement of exhibits, members of a class generally having been found together. Other speakers were: John E. Lager, John S. Hay, H. T. Beers, of the A. N. Pierson, Inc.; James Robertson, Andrew S. Meikle, chairman of the committee of arrangements, and Secretary

iam Gray. Votes of thanks were passed to Mr. Taylor for his thoughtfulness in providing the banquet; to Mr. Powell and Miss Wetmore, of the Garden Association, for their untiring efforts to make the show a success; to Mr. Manda, the manager, and to the local press

EXCHANGE.

#### OYSTER BAY HORTICULTURAL SO-CIETY ANNUAL JUNE SHOW.

The June exhibition of the Oyster Bay Horticultural Society was held in the Fireman's Hall, Thursday, June 18. The exhibition was the largest held since the establishment of this society and all classes were well filled. The roses were the leading feature and Benjamin Stern secured first prize for best collection of H. P.'s. gardener, W. Robertson. Best collection H. T., E. F. Whitney, gardener, James Duckham. Best three varieties H. P. white, first, Albert Straus; gardener, Michael O'Niel. Best collection, three varieties H. T. pink, first, F. N. Doubleday, Esq.: gardener, F. Gale. Best six H. P. white, first, Mrs. C. L. Tiffany; gardener, F. Kyle. Best six H. P. pink, first, Charles Mapes. six any other color, first, F. Kyle, Best three H. P. white, Chas. Mapes, first. He also received first for best three pink and best three any other color. W. Robertson first for six Teas or H. T. white; also first for best six pink and first for any other color. Best three T. or H. T. white, first, F. Gale. Best three Teas or H. T. pink first, Chas. Mapes. Best three H. T., any other color, first, F. Gale. Best collection climbing roses, first, Jas. Duckham. Best vase climbing roses, first, John A. Garver, Esq., gardener John Somcisk.

There was keen competition in the vegetable classes and E. F. Whitney secured first for collection of six varieties, gardener, Jas. Duckham, with H. E. Smith second, gardener, Alfred Walker. Best three lettuce, James Duckham. Best six beets, first, Walker. Best six carrots, first, A. Walker. Best six turnips, first, F. Gale. Best twelve plants spinach, first, F. Gale. Best asparagus, first, Chas, Movses. Best

first, Jas. Duckham. Best radish, first, A. Walker. Best brace cucumbers, first, Geo. Bullock, Esq.; gardener, D. Horeshall. Best six tomatoes, first, Jas. Duckham, Best six onions, first, Michael O'Niel.

Best collection strawberries, first, Walker. Best twelve strawberries, one variety, for size, first, A. Walker. Best Best twelve strawberries, one variety, for flavor, first, A. Walker. Best six strawberries, one variety, for size, first, Michael O'Neil. Best six strawberries, one variety, for flavor. first, Chas. Mapes. Dish any other fruit, first, Chas. Mapes. Best basket of strawberries arranged for effect, first, A. Walker.

Best collection hardy flowers, first, John ovesick; second. A. Walker. Best vase Lovesick; second. A. Delphiniums, first, John Lovesick; second, F. Kyle. Best vase Sweet William, first, Jas. Duckham. Best vase Digatalis, first, Jas. Duckham. Best vase Campanula, first, John Lovesick: second. F. Kyle. Best six varieties Sweet Peas, first, W. Robertson. Best collection Poenies, first. Michael O'Neil. Best bouquet of hardy flowers, first, John Lovesick. Best collection hardy flowering shrubs, first, John Lovesick. Best specimen Nephroepis, first, John Lovesick. Best specimen fern, any variety, first, John T. Ingram. Best foliage plant, first, John Lovesick. Best three plants of orchid in flower, first, John T. Ingram. Best specimen Hydrangea, any size, first, F. Kyle. Best two Hydrangea, 8-inch pots, first, F. Kyle. Best two Hydrangea, 5-inch pots, first, F. Kyle. Best pot of Begonia, first, John Lovesick. Any other pot plant, first, David Hothersall. Best collection Sweet Peas, John T. Ingram's special, first, Wm. Robertson; second, Jas. Duckham.

W. Robertson received C. C. for collection roses. a

F. Duckham received C. C. for collection of roses.

T. A. Havemyer, C. C. for collection peonies; also C. C. for an excellent exhibit of hardy flowers and shrubs; gardener, A. La Hodney.

J. T. Ingram, H. M. for collection climb-

W. Robertson, C. C. for collection Sweet Peas.

Frank Petroccio, C. C. for exhibit of lettuce; also C. C. for collection of vegetables. E. M. Townsend, Esq., C. C. for collection strawberries, gardener, J. Duthie. F. KIRKHAM, Secretary.

#### NEW BEDFORD HORTICULTURAL SOCIETY JUNE SHOW.

The two June shows of the New Bedford Horticultural Society, the peony show on June 17, and the rose on June 24, showed a decided increase in interest and proved that these two beautiful flowers are gaining in favor each year. Notwithstanding the trying season, probably the worst in a decade at least, the exhibits of peonies were remarkable and in consideration of the fact that this flower is just coming to the notice of flower lovers in this section, the committee feel that an annual exhibit is assured.

Through the center of the hall was a long table entirely devoted to peonies, the principal exhibitor being E. J. Shaylor, of Auburndale, with 75 specimen blooms (for exhibition only), and J. H. Hathaway, an enthusiastic amateur of this city, with about the same number, conspicuous among which were fine specimens of Japanese

Among Mr. Shaylor's exhibit were to be

berries, and John Baumgartner, for collect rhubarb, first, C. Mapes. Best pods of seen four of his seedlings which do credit tion of strawberries. Vegetables: J. B. peas, first, A. Walker. Best string beans, to any grower and strongly impressed the peony enthusiasts with the fact that as good novelties can be bought at home as those that come from far away France or England. His "Mary Woodbury Shaylor," as seen in the field, takes rank with Kel-way's great success, Lady Alexandria Duff.

The other principal exhibitors were D. F. Roy, who secured the Henry F. Michell silver medal for the best collection; James Garthly, Wm. Keith, J. H. McVicker and F. G. Tripp.

Bronze medals were awarded to J. H. Hathaway and W. F. Turner for their ex-

hibits.

The rose show has always been the most popular of all exhibits and this year proved no exception. In all previous years the exhibits of Miss Fay and M. H. Walsh have been the main supports, but this year, owing to a backward season, they were unable to send any flowers. While. owing to this fact, the wonderful possibilties of the rose were not as strongly depicted, yet the show was a grand success. Local growers came nobly to the rescue and never before has such a varied assortment of roses been put before the public of this city, giving enthusiasts a splendid chance for choosing their favorites. open class D. F. Roy, "The Moorings," Marion captured all the prizes, while A. R. Griffin, superintendent of the Galena Stone estate, received a well merited certificate of merit for specimen blooms. James Garthly and Wm. Keith had their usual fine displays tastefully arranged.

Among the amateurs, Miss Alice Stockpole, of Mattapoisett, was the largest exhibitor and prize winner, sixteen firsts being her record for the day. F. G. Tripp, of this city, had a large display and H. B. Parlow, J. C. Forbes and W. F. Turner

were close rivals.

Perhaps the table attracting the most attention was that occupied by A. J. Fish, of this city, with thirteen varieties of large flowered hardy climbing roses, such as Silver Morn, Dr. Van Fleet, Wm. Egan, Climbing American Beauty and Christine Wright. These were cut with long stems and made a most attractive display. Hybrid Teas and teas were decidedly in evidence. conspicuous among them being The Daily Mail, Konigin Carola, La Tosca, Lady Hillingdon, J. J. L. Mock, Lady Pirrie, Mabel Drew and Mrs. Gordon Sloane. W. F. TURNER.

#### NEW LONDON HORTICULTURAL SOCIETY ROSE EXHIBITION.

The New London Horticultural Society held its annual exhibition of roses, July 1. The rooms of the society were packed with members and friends, many having to stand during the lecture. Mr. Alex. Cummings. of the A. N. Pearsons Company, Cromwell, was the speaker. His remarks on culture of the rose as to soil, pruning, protecting during winter, and also some of the best varieties grown for profit, were very interesting and profitable to the many present. At the close of his address an interesting discussion took place in which Mr. Cummings very readily gave informa tion to the various queries. A very fine display was on view from the Cromwell gardens, also from local growers. Mr. Cummings was extended a rising vote of thanks for his remarks. The regular monthly meeting of the society will be held July 9, at which it is proposed to have held July 9, at walker a display of sweet peas. STANLEY JORDAN.

On Friday, June 12, a party of friends met at Kineraig, Tuxedo Park, N. Y., and were entertained to a shooting contest, when some very fine shooting took place. Our host being a little off color did not score so well as he did at our previous contest. A fine atternoon's sport was enjoyed by all those present. The ranges were 75 feet and 150 (cet); the scores were as follows:

75 feet possible 125.

#### CONNECTICUT HORTICULTURAL SOCIETY.

The regular bi-monthly meeting of the Connecticut Horticultural Society was held on Friday evening, June 26. An invitation was received from Professor A. G. Gulley. of the Connecticut Agricultural College, to meet at that place with the Pomological Society and the vegetable growers on July 22 and 23, and it was unanimously voted

to accept the invitation.

This was hardy perennials' night and without doubt one of the finest collections of these beautiful flowers was staged by Warren C. Mason, John F. Huss and W. W. Hunt. The collection contained in the neighborhood of 161 varieties, and add to this magnificent collection six varieties of Canterbury Bells, exhibited by Fred K. Wisner, and thirty varieties of Sweet Peas. the exhibit of John C. Willard, it made a George H. Hollister, John Gerard and George B. Baker judges, and they awarded the exhibits of Messrs. Mason and Willard a first clas certificate each. The Canterbury Bells received a certificate of merit. Both Messrs. Huss and Hunt received certificates of merit for their displays. Mr. Mason remarked on the peculiarities of some of the varieties in his collection, selecting certain speciments for their hardiness and fitness for filling in, etc. The meeting was well attended and thoroughly enjoyed by the The next meeting will be held August 28.

ALFRED DIXON, Secretary.

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

County Horticultural Society was held on fine attendance. There will be athletic Wednesday, July 8, at Pembroke Hall, Glen sports of all kinds, including baseball, foot Cove, President Henry Gaut in the chair.

Special prizes for the society's fall shows were received from C. F. Cartledge, Esq., R. Meserole, W. R. Kinnear, E. M. Underhill and the Glen Cove Echo.

John Fogerty and Fred Titus were elected cellent shore dinner provided in connection

TUXEDO HORTICULTURAL SOCIETY, to active membership, and two petitions for membership were received.

The exhibits for this meeting were all

sweet peas, and the number and quality of the exhibits far surpassed any previous exhibits at this society's monthly meetings. Henry Gaut cleared the board by taking first prize in all three classes, viz., 25 white, 25 pink and 25 any other color. He also received a cultural certificate for a nne vase of Isabelle Malcolm, Herman Boettcher cultural certificate for 14 distinct vases, and George Ashworth, honorable mention for vase of Flora Norton (Spencer) copy of the schedule of the New York State Fair at Syracuse in August was received, and it was resolved to make a collective display of the vegetables representative of the society. It was also resolved that we adopt a standard scale for judging flowers and vegetables at the society's Chrysanthemums, carnations and roses will be judged by the official scale of points of their respective national societies, and a committee was formed to compile a scale for judging vegetables. Mr. Allan Jenkins and Mr. Baldwin were visitors and addressed the meeting. Exhibits for next meeting, August 12, will be for six kinds of vegetables.

HARRY JONES, Cor. Sec'y.

#### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

Climatic changes and weather conditions do not seem to affect the enthusiasm of the wide-awake aggregation of private gar-deners known as the Westchester and Fairfield Horticultural Society, who held their regular meeting in Doran's Hall, Greenwich, Conn., Friday evening, July 10, with a fine attendance, President Robert Williamson presiding. One new member was elected, and a number of propositions for membership were received. The summer show committee in charge of the exhibition held in June, made their final report, and it is a pleasure to record the fact that there is a substantial balance in favor of the society. The committee, including Mr. W. J. Scaley, under whose able management the exhibition was staged, received the thanks of the society. It was also voted to send resolutions of appreciation to the many friends who in various ways contributed to the general result and helped to make the best summer show held in recent vears.

Letters from several friends of the society were read offering substantial additions to the prize list of the fall show, to be held in Germania Hall, New Rochelle, X. Y., November 4, 5, 6, inclusive. The schedule is being prepared and will be issued when ready. An attractive list of prizes will be offered, including cash gold, silver and bronze medals, caps, cut glass and silverware articles. There will be classes for outdoor and indoor grown flowers, fruits and vegetables, table decorations, baskets and other floral decorative work. That all may have a chance it is necessary to publish the fact that Carter & Co., of Boston, offer prizes for 25 fruits of their Sunrise" tomato.

The annual outing will be held august 11 at Edwards' Rye Beach Hotel. The success The monthly meeting of the Nassau of our outings held in the past will assure a ball, tug of war, etc. Provision will also be made for ladies' races, and games and pastimes for the little folks. Regarding the matter of lunch, everybody may suit themselves; there will, however, he an ex-

with the outrag at \$150 a person. Those desiring dinner tickets will kindly notify Mr. Wm. I Scaley, or Portchester, N. Y. as early as convenient that ample provision may be made in advance, and not necessitate half portions, which condition of affairs sometimes result from a rush of unexpected guests. We can assure all who attend a pleasant day's sport. games will start promptly at 10:30 o'clock a. m. During recess Mr. James Melcher, of Stamford, Conn., one of our fellow members, entertained the "boys" with a number of very clever sleight o' hand tricks that were enjoyed by all. Our genial friend from Stamford, Conn., also amused us with some

humorous songs and stories, On the exhibition tables there was a shorce and varied display of cut dowers and flowering plants. A magnificent specimen of the new geranium "Helen Michell" in a 4-inch pot, exhibited by Alex Marshall, was awarded a cultural certificate. Mr. Marshall was also highly commended for a vase of climbing rose "American Pillar," and a cattleya hybrid. James Stuart was highly commended for a fine collection of hollyhocks. The thanks of the society was awarded the other exhibitors. Specimen plant Lilium Auratum, from Fred Lagerstam. Vase of the new Achillea Perry's White from A. Bieschke; vase of assorted Japan iris from John McAllister; vase of Lathyrus Catifolius from E. Johnson: climbing rose Blush Rambler from A. Whitelaw: Allamanda Shotti from P. W.

Don't forget the outing, which will take place before the next meeting to be held at Greenwich, August 14.

P. W. POPP, Secretary.

YOU KNOW how irreparable the loss should it die.

YOU KNOW how imminent is the danger from insects and fungi.

YOU KNOW how devitalising, how unsightly, and how difficult to reach is that dead wood.

YOU KNOW how surely fatal are those neglected cavities—neglected decaying stumps, neglected wounds, neglected borer holes are the causes.

Then Why Wait Longer? Time Is Precious. CALL US IN

WE HAVE the KNOWLEDGE, the EXPERI-ENCE, the MEN, the TOOLS.

# Gardeners All Over the World Use

**APHINE**, for spraying against all sap-sucking insects, such as aphis, red spider, thrips, mealy bug and soft scale; and for cleansing palms and decorative stock generally.

**NIKOTIANA**, for fumigating, a nicotine solution which does not fill the house with smoke as does tobacco paper or dust. It is vaporized in pans over small lamps, or by painting the steam pipes.

FUNGINE, to control mildew, rust or bench rot in the greenhouse, a spraying material; an infallible remedy. It does not stain foliage as Bordeaux or lime and sulphur, but cleanses it.

**VERMINE**, to rid the greenhouse soil of eel worm, root maggots and other soil vermin, will be found most effective. Used according to directions it is not injurious to vegetation.

## For Out Door Spraying of Trees, Shrubs and Hardy Plants

**SCALINE**, an oil and sulphur composition—three in one—an insecticide, fungicide and scalicide combined, destroys San Jose, Oyster Shell and other scale, red spider, larva of the aphis and locust borer. Now is the time to spray to protect your trees and shrubs against the ravages of the various insect pests.

Get in the habit of using our products and you will use no other

Border of Lilium Candidum (the hardy St. Joseph or Annunciation Lily).

This is the old-fashioned garden Lily and is perfectly hardy, blooming in the open ground in June. The many snow-white flowers, borne on a stem 3 to 4 feet high, make this Lily most effective. This variety should be planted in the fall, from the fact that it makes a winter growth. Stock from the north of France. 15 cts. each, \$1.50 per doz., \$12 per 100. Monster bulbs, 20 cts. each, \$2 per doz., \$16 per 100.

# STAIGREEN LAWN SEED

For Lawn Making few months in the year are considered as advisable as August or early September. While the proper preparation of the ground, fertilizing, rolling and watering is considered very essential, the mixture of grasses is a very important one and should be given considerable thought.

### 25-Pound versus 14-Pound LAWN SEED

Many low-price Grass Seed mixtures weigh only 14 pounds per bushel. This indicates either a good proportion of chaff or some of the real good varieties in the rough state, not properly cleansed so as to leave only the vital part and less of the chaff or shell.

In other words, so many less seeds to the quart or pound that will germinate and grow real grass.

### Why Not Buy the Re-cleaned Kind?

A mixture of grasses weighing 25 pounds per bushel, of high germination and purity, permanent in nature, the varieties carefully proportioned so that they will succeed one another in brightness of foliage, with the result that the lawn, even in its first year, will have a bright, rich green color from early spring until covered by snow.

# The Garden

By Andrew Marvell.\*

How vainly men themselves amaze, To win the palm, the oak, or bays: And their incessant labors see Crowned from some single herb, or tree, Whose short and narrow-verged shade Does prudently their toils upbraid; While all the flowers and trees do close, To weave the garlands of repose.

> Fair Quiet, have I found thee here, And Innocence, thy sister dear? Mistaken long, I sought you then In busy companies of men. Your sacred plants, if here below, Only among the plants will grow Society is all but rude To this delicious solitude.

> > No white nor red was ever seen So armorous as that lovely green. Fond lovers, cruel as their flame, Cut in these trees their mistress's name. Little, alas! they know or heed, How far these beauties her exceed! Fair trees! where'er your bark I wound, No name but your own be found.

When we have run our passion's heat, Love hither makes his best retreat. The gods, who mortal beauty chase, Still in a tree did end their race. Apollo hunted Daphne so, Only that she might laurel grow; And Pan did after Syrinx speed, Not as a nymph, but for a reed.

What wondrous life is this I lead! Ripe apples drop upon my head; The luscious clusters of the vine Upon my mouth do crush their wine; The nectarine and curious peach Into my hands themselves do reach; Stumbling on melons as I pass, Insnared with flowers, I fall on grass.

Meanwhile the mind from pleasure less Withdraws into its happiness—
The mind, that ocean where each kind Does straight its own resemblance find:
Yet it creates, transcending these,
Far other worlds and other seas;
Annihilating all that's made
To a green thought in a green shade.

Here at the fountain's sliding foot, Or at some fruit-trees's mossy root, Casting the body's vest aside, My soul into the boughs does glide: There like a bird it sits and sings, Then whets and claps its silver wings, And till prepared for longer flight, Waves in its plumes the various light.

Such was the happy garden state,
While man there walked without a mate;
After a place so pure and sweet,
What other help could yet be meet?
But 'twas beyond a mortal's share
To wander solitary there:
Two paradises are in one,
To live in paradise alone.

How well the skilful gardener drew Of flowers and herbs, this dial new! Where from above the milder sun Does through a fragrant zodiac run; And as it works, th' industrious bee Computes its time as well as we. How such sweet and wholesome hours Be reckoned, but with herbs and flowers.

<sup>\*</sup>An English poet and satirist, died in London, 1678.

# Gardens in and Around Boston

By W. N. Craig.

It is twenty-four years since the Society of American Florists last met in Boston. On that occasion the estates of H. H. Hunnewell, of Wellesley, and Francis B. Haves. of Lexington, were two of the most celebrated in the State. The visitors to the convention to the number of many hundreds were hospitably entertained at each estate, and no doubt not a few who will visit the Hub this year will remember James Comley, of the Hayes estate, and the genial and popular Frederick L. Harris, of the Hunnewell estate. The number of private estates has increased many-fold in the last quarter of a century and, while there will be no special trips to visit any of these on the present occasion, the owners and superintendents will be very glad to welcome all visitors from a distance who can spare the time to pay them a visit; especially welcome will be the members of the National Association of Gardeners, not yet very strong in the old Bay State, but likely to show a considerable growth as a result of the summer meeting of the N. A. G. in Boston.

In a few notes, hurriedly written, it is not possible to refer to more than a few of the prominent estates and

EAST VIEW IN RHODODENDRON SEASON, ROCK GARDEN, PROCTOR ESTATE, TOPFIELD; JAMES MARLBOROUGH, SUPERINTENDENT.

many of them not mentioned are worthy of a visit. I regret that it was not possible at short notice to secure more photographs of some of our best places.

At Wellesley, which is within a dozen miles of Boston, and easily reached either by Boston & Albany R. R. or by electric cars, is found one of the most charming towns in Massachusetts and here are located some beautiful private estates; the best known is the one aforementioned, now the residence of Walter Hunnewell, where T. D. Hatfield is in charge. The collection of specimen trees and shrubs found on this estate is very fine and quite extensive, conifers and rhododendrons being the special attractions. The noted Italian garden on the beautiful shores of Lake Waban has a country-wide fame, while in the greenhouses are excellent collections of orchids, stove and greenhouse plants. The estates of Mrs. Arthur Hunnewell, Frederick Coles, superintendent, and Henry S. Hunnewell, J. G. Duguid, superintendent, are also well worth a visit.

The North Shore of Massachusetts, sometimes named

the "Gold Coast" owing to the large number of wealthy Americans having residences there, is one of the most beautiful and popular summer resorts in the country. It it a serious rival now of Newport, Lenox and Bar Harbor, and judging by its state of development, it bids in the near future to take the lead even over these famed resorts. There are in Manchester, West Manchester, Pride's Crossing, Beverley Farms, Magnolia, Marblehead and other North Shore towns and villages a host of beautiful gardens. A few worthy of special mention are those of Judge W. H. Moore, Pride's Crossing, where Geo. Wyness presides; here the splendid lawns and rock gardens are features; W. S. Spaulding, Pride's Crossing; E. C. Swift, Mrs. Lester Leland, Manchester, where one of our most skilled gardeners, E. H. Wetterlow, is in charge; Mrs. Dudley L. Pickman, F. P. Fraziers, W. E. Endicott, of Danvers, and to which might be added many

AN INTERESTING NOOK ON THE ESTATE OF MR. BAYARD THAYER, SOUTH LANCASTER; WM. ANDERSON, SUPERINTENDENT.

more. The visiting ladies at the convention will be given a 70-mile ride over the North Shore and will be entertained at lunch to the number of three hundred by the North Shore Horticultural Society, which comprises within its ranks all the best gardeners and many of the employers in this renowned section. Frequent trains over the Boston & Maine R. R. may be had to North Shore points, the running time being from forty to seventy minutes.

At Topfield is to be found one of the largest and most varied estates in Massachusetts, that of Thomas E. Procter, where James Marlborough is superintendent.

POOL ON THE ESTATE OF MR. BAYARD THAYER, SO, LANCASTER.

On this immense estate is to be found one of the finest private arboretums in the world, rivaling in some respects even the famous Arnold Arboretum. A magnificent rock garden, skillfully built and planted is to be found here. In the greenhouses grapes and other indoor fruits are grown to a perfection rarely attained, pot fruits being given special attention and are splendidly done. An exhibition of one hundred and twenty-five varieties Caladiums from this estate was a feature at a show in Boston on August 8 and 9 last.

South Lancaster, Mass., contains several noted estates, the largest and best known is that of Bayard Thayer,

ENTRANCE TO THE ISTATE OF MRS. OLIVER AMES, NO. EASTON; H. COLE, SUPERINTENDENT.

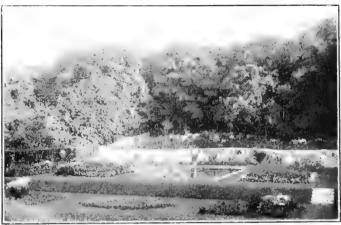

William Anderson, superintendent. There is an immense collection of trees and shrubs here, including quantities of nearly all of Wilson's Chinese introductions. In May a display of 50,000 tulips and large quantities of Narcissus are a great feature here. The nursery on this estate is larger than some commercial places and tens of thousands of Scotch Heathers, Kalmias and other plants are to be seen in various stages. There is also a fine range of greenhouses.

The estate of John E. Thayer, J. T. Clarke, superintendent, also at South Lancaster, is laid out with great taste, the naturalizing of bulb and other plants being done charmingly. Other estates in the community are those of E. V. R. Thayer, where Frederick Abraham has charge, and Mrs. Nathaniel Thayer.

North Easton, Mass., some twenty-two miles from Boston on the N. Y., N. H. and H. R. R. contains several interesting estates. Those most worthy of a visit are the

estates of Mrs. Oliver Ames, in charge of Harry Cole; John S. Ames, William Swan, superintendent; Winthrop Ames, Daniel Whyte, superintendent; Oliver Ames, Edward Parker, superintendent; Miss M. S. Ames, Andrew Masson, superintendent; and F. L. Ames, William Grant, superintendent.

Brookline, is a very near suburb of Boston, noted as being the wealthiest town in America; its assessable valuation being over \$135,000,000. Its various estates can all be reached by electric cars from Park street subway station, although some of the larger ones are a distance from the cars. The estate of Prof. C. S. Sargent, "Holm Lea" needs no introduction. The two hundred or more acres are planted with exquisite taste. There are many fine

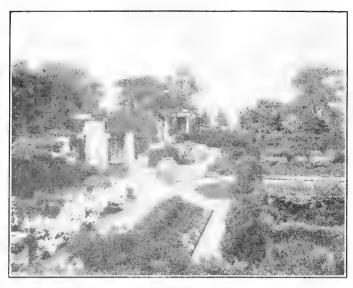

A FORMAL TERRACE GARDEN ON ESTATE OF MR. WINTHROP AMES, NO. EASTON: DANIEL WHYTE, SUPERINTENDENT.

specimen trees and shrubs here, not a few extremely rare and unique. Wilson's new plants are seen on all hands. Charles Sander, the skillful and popular superintendent, is one of the best craftsmen we have in America. Anyone doubting this statement should see how he raises tens of thousands of difficult subjects from seeds, or grafts; should view his grand collection of seedling Moutan peonies, or his wonderful specimens of Azelea Indica, Trachelospermum jesminoides, and standard wistarias; also his wonderful seedlings of Imantophyllums and Nerines.

At Larz Anderson's, over which Duncan Finlayson presides, the Italian garden is the most striking feature; this has been illustrated in many of the gardening and

A LAKE SCINE ON ISTAIT OF MR. JOHN S. AMES, NO. FASTON: WM. ST., AN. HEAD GARDINER

VIEW OF ITALLYN GARDLN ON ESTATE OF MR. LAPZ ANDER SON, BROOKLINE, DUNCAN FINLAYSEN, SUPERINTENDENT.

other magazines. In the greenhouses, divisions are devoted to grapes, peaches, orchids, roses, carnations and other plants.

At Mrs. C. G. Welds, W. C. Rust, superintendent, extensive changes have recently been made, the whole place practically being replanted and fine new greenhouses built.

Mrs. John L. Gardener's estate has for years been well known. The Italian garden is a leading feature; the orchids and other greenhouse plants are well done by William Thatcher, who is in charge.

At E. D. Brandegec's, "Faulkner Farm" a pond two

VIEW OF ITALIAN GARDEN ON ESTATE OF MR. E. D. BRANDEGEE, BROOKLINE; W. N. CRAIG, SUPERINTENDENT.

acres in extent is being excavated and will soon be ready for flooding. New features soon to be added are a rock garden, rose garden, walled-in garden, swimming pool and up-to-date farm buildings. W. N. Craig has charge here.

In Chestnut Hill, which adjoins Brookline, the estate of Ernest B. Dana, where Donald Mc Kenzie is the horticultural genius, contains the finest collection of Orchids in America. At E. S. Webster's, William Downs, superintendent, there is a fine range of U-Bar greenhouses and they always contain seedlings of interest to visitors.

There are numerous other private estates of note in Newton, Weston, Westwood, Framingham, Hamilton,

Wenham, Hingham, Cohasset, Plymouth, etc., but space will not permit of any reference to them. Estates in Massachusetts usually average smaller in area than similar ones in New York, but no state in the Union is more keenly interested in horticulture than Massachusetts, and this love of plants and flowers pervades all classes. Members of the N. A. G. gathering in Boston on August 19 are sure to find something to interest them on all the places they may have time to visit.

### THE MUTATION THEORY A MYTH.

During the past decade, no phase of botany has received greater attention than the mutation theory of DeVries. In brief, this theory accounts for the origin of new species by the occurrence of sudden leaps or mutations from existing species, in contradistinction to the Darwinian theory which assumes a slower and more gradual variation from existing forms. Both theories are based on the idea that plants vary from the normal and differ chiefly in the length and number of the jumps or mutations required to make the new form a species. DeVries stands for a single long jump, Darwin for a succession of shorter ones. Much plausibility has been given the theory advocated by DeVries by his production of new forms from that form of evening primrose known as Oenothera Lamarckiana, but Prof. E. C. Jeffrey writing recently in Science claims that O. Lamarckiana is a hybrid. The great trouble is to decide what are and what are not hybrids. The old test for a hybrid was its sterility. If completely sterile it was considered as certainly a hybrid. Hybrids, however, are now known to be of various grades of fertility. A great number of crosses between different species have been made and as the plants crossed differ in the degree of relationship, it follows that various grades of sterility may exist. Jeffrey gives it as his opinion that hybrids may always be identified by the fact that the pollen grains are more or less abortive and infertile. Judged by this test, the plant with which DeVries made most of his experiments is a hybrid and Jeffrey insists that in consequence the mutation theory has no standing in court and should be relegated to the realm of myths. It may be said, how-ever, regardless of the merits of the new theory, that the discussion of the subject has had a tremendous influence on the production of new forms by breeders and this much at least must be set down to its credit.-American Botanist.

# Opportunities in Floriculture

By Arno H. Nehrling.

The development of floriculture in the United States dates back to the eighteenth century. About that time the wealthier citizens of Boston, Philadelphia and New York began to cultivate large gardens around their residences, usually arranged in terraces after the English style of that period. The revolutionary war stopped further progress in floriculture or gardening until the country became more settled under the new government. The actual development began from that time on and the progress has been remarkable. In no phase of horticulture have the advances been as great as in floriculture.

The growth of the cut-flower industry the past twentyfive years has been phenomenal. The past decade has also witnessed great advances in the production of ornamental plants, in fact the growing of flowers and plants under glass, which was originally a luxury of the wealthy. has developed into a profession which is one of the most important phases of horticultural work. In the earlier days of the cut flower industry, European methods of culture were in vogue. The few roses and carnations that were grown, were grown mostly in pots, the greenhouses of those days being very primitive. In the character of the greenhouses devoted to the cultivation of cut-flowers and plants there has also been a wonderful advancement the past twenty-five years. Twenty-five years ago 11-foot houses, covered with sash and heated by hot air flues were considered quite the thing. Then came houses 18 to 20 feet in width, then the house from 30 to 60 feet in width, and today we find a number of houses from 100 to 172 feet in width and 1,000 feet long. The methods of construction and heating have, of course, also been improved. And in speaking of advancement we must not overlook the wonderful development that has occurred in our principal commercial crops. Carnations for instance have been increased in size from the size of a half dollar to approximately four inches. One of the most phenomenal improvements that have been made in any flower has been made in the chrysanthemum, which has been developed to such an extent that one who knew it twenty-five or thirty years ago would not recognize the immense blooms

According to the 1910 census reports there were 11,614 establishments with a combined glass area of 105,165,730 square feet, or more than 3,217 acres, in the United States. This does not include the area covered with hotbeds and cold frames which at that time amounted to approximately 150 acres or 9,489,546 square feet. These census figures give Illinois the largest glass area, namely, 14,380,927 square feet, or over 330 acres. New York comes second, with over 13,000,000 square feet; Pennsylvania third. with over 12,000,000 square feet; New Jersey and Massachusetts follow in the order named. This acreage seems rather small when we compare it with some of our farms. One must keep in mind, however, that returns from a farm ranging from \$50 to \$150 mean big profits. On the other hand an acre under glass must bring from \$15,000 to \$20,000 to make the investment a profitable These returns are necessary, of course, not only because of the larger amount of capital invested, but also to the much greater cost of operation. The value of the output for 1910 was estimated to be at least \$40,000,000. In value of the crop, roses are at the head of the list with carnations second and the violet third. The latter crop alone was valued at a little over one million dollars last

In commercial floriculture the East, particularly New England, has made wonderful progress.

Boston has always been a leader in floricultural work, and no institutions in the country have done as much as the Massachusetts Horticultural Society and the Boston Gardeners' and Florists' Club in promoting horticultural interests. Along scientific lines we must always keep in mind the work of C. S. Sargent, who has given Boston the finest Aboretum in the world, E. H. Wilson, who has collected materials in regions hitherto unknown, and Jackson Dawson, that eminent plant propagator.

The concentration of wealth in New York and Boston insures for the eastern grower the highest prices for his products. It also affords the private gardener the largest

opportunity for the pursuit of his profession.

The development in the West in the past twenty-five vears has been equally as wonderful. In fact the Middle Western grower has over-shadowed his Eastern brother in the amount of capital invested, in modern equipment, and cultural methods. At the present time Chicago is one of the greatest flower markets in the country and it is the principal distributing center of the Middle West. From there cutflowers are shipped in great quantities to all the neighboring states, and regular shipments are made to New Orleans, Jacksonville, Florida and Denver, Colorado. The choicest flowers sold in the flower shops of New Orleans during the winter months come from Chicago. And yet this industry can be traced back to 1878, when J. C. Vaughan started a small cutflower business. Since that time the business has developed to monster proportions and according to a prominent floriculturist of that section is still in its infancy and destined to undergostill greater development and more radical changes. Near Chicago are found the two largest glass areas in the world. One of these known as Poehlman Brothers' establishment, originated in 1885 when Adolph Poehlman started to grow flowers in a small way at Morton Grove, Illinois. In 1889, John and August Poehlman joined their brother and the firm entered in the cutflower market in 1894 under its present name. The business has proven highly successful and the little range of glass at Morton Grove, about 20,000 feet in all, has reached the enormous total of over 2,000,000 feet. Peter Reinberg is said to have the second largest glass area, about 2,000,000 feet in all. At one time, over a million feet alone were devoted to the culture of the American Beauty Rose. But the development of the industry has not ceased at Chicago or the Rocky mountains. It is noticeably clear to the Pacific coast, California having some of the most modern establishments in the country

Much has been done to further the floricultural interests by progressive horticultural societies. There are between 400 and 500 societies in existence in the United States at the present time, not including the bona fide trade organizations. In nearly every large city is to be found a Florists' Club organized for both business and social purposes. Many states have State Florists' Associations, working along some particular line, always exchanging new ideas and seeking information. These ideas are somewhat different from those of the old-time gardeners who kept their methods secret, often working behind locked doors. The most important organization, however, is the Society of American Florists and Ornamental Horticulturists, a national society working under a charter granted by the federal government. Similar organizations are the National Association of Gardeners, the American Carnation Society, the American Rose Society, the Chrysanthemum society of America, the Americans Sweet Pea Society, and the American Gladiolus Society. Each one of these societies is working along a different line, all have the same end in view, namely, the betterment of the industry or profession.

Mr. W. J. Stewart, in a recent editorial, says: "The splendid structures which shelter the products of the commercial grower of today, as well as those of his wealthy amateur neighbor, represent years of close investigation and study of the myriad problems of the science of light and heat and their practical application to the specific demands of a rapidly advancing business. One of the best evidences of the stable character and dignity which the floral industry has attained is the enterprise and confidence displayed and the capital being invested in greenhouse construction. It would seem almost impossible to further improve, but no doubt the next few years will see continued advancement, for there is every reason to be-Jieve that the plant, flower, and fruit forcing industry is yet only in its infancy and no business offers fairer inducements for the employment of capital and brains.

The most recent figures show that there are 456 cities with a total acreage of 75,542 devoted to parks in this country with a total valuation of \$528,229,000. There are also over 30 botanical gardens in this country, all having glass houses for their botanical collections.

Looking back at the progress that has been made during the last twenty-five years, and the improvements that have been made even during the last five years, one can only wonder at what the next twenty-five years have in store for us. We have not reached the end and we have reason to expect as much advancement in the future as has occurred in the past.

Floriculture is becoming a profession based on the application of scientific knowledge. It is no longer in an experimental state; it has assumed immense proportions, and is upon a safe basis. Granting then, that flowers are no longer considered luxuries, and knowing that America leads in the production of cut flowers and that the number of conservatories in public parks is increasing, the question naturally arises "What are the opportunities for scientifically trained men in floricultural work?"

These opportunities or openings for trained men may be classed under four distinct headings, namely, commercial work, private estate work, park and cemetery work, and instructional and experimental work. Before discussing the individual lines of work let me add that the wonderful development along lines of plant culture in this country are due largely to the untiring efforts displayed by our European trained men. We owe much to men who received their training at the Kew Gardens under the old apprentice system. Germany, France and Sweden have also sent us excellent men, and these men display a thoroughness and a knowledge of plants at which the average American gardener marvels. But we have reached a critical stage in the development, the gardeners of the older schools are becoming fewer, and men trained and acquainted with conditions in this country are in greater demand.

Let me emphasize the fact that a thorough knowledge of the subjects involved is imperative. This knowledge may be obtained either by working under the direction of a trained man according to the European system, or through the courses now offered by our agricultural colleges. The latter way seems to have many advantages because the conditions in this country are somewhat different, then, too, with the changes in our systems of education along all lines of agriculture, new ideas have been adopted which are proving to be highly successful. Floricultural education as a separate course in the college curriculum is then of comparatively recent origin in America. It is by no means perfect, and it will take years

to develop a course which will approach the system under which our successful gardener of the present-day received his training. To the son of a commercial florist or the son of a gardener the present system can offer little of value along practical lines. Such a man can get far better practical training on his home place, but it is logical to suppose that to the florist's son who expects to follow his father's profession, the training in floriculture is as valuable as an agricultural training would be for the man who intends to return to the farm. The practical courses are primarily planned for those students who have never worked under glass. These men cannot get too much The time is coming when every student practical work. will be required to spend a year in an up-to-date commercial establishment or private place, before he will be graduated from a floricultural course. Even now, we always urge our students to find employment on a commercial or private place during the summer months in order to gain practical knowledge. The various courses offered at the Massachusetts Agricultural College at the present time, cover a period of four years. Besides the floricultural subjects of which every florist should have a working knowledge, such subjects which broaden the student and are necessary for a successful career are included in the course. The lectures are designed to cover the theory, while the laboratory work consists of practical work in the greenhouses and gardens, and is designed to give the student a working knowledge of the best methods now in use. The object of the course then is to give instruction in those branches which best fit men and women for the floricultural work and for life.

One must keep in mind, however, that in choosing this line of work it means more than just watching and waiting developments. To my knowledge there is no line of work where the duties are more exacting, or where the pleasures of development are greater.

It is a great privilege to any one to work for the common uplift of humanity and there is no greater opportunity, than to encourage on every occasion that may present itself the purpose of interesting some one, child or man, in our flowers, trees and shrubs, or in any of God's great creations.

"Plant flowers in the Soul's front yard, Set out new shade and blossom trees, And let the Soul once frozen hard, Sprout crocuses of new ideas."

#### THE DYING TREE.

By Walt Mason.

Ah! it is saddening to see a beautiful and stately tree in process of decay; it took long years to reach its height, and then there fell a deadly blight that ate its heart away. It seems to know it's in the soup, for all its leaves and branches droop, 'tis a despairing thing; and in the zephyr or the gale it seems to moan and sigh and wail, when it should dance and sing. There's nothing nobler than a tree, there's naught that more appeals to me, and, oh! it makes me hot to think such stately things must die because some derned old worm or fly has given it dry rot. And in our towns a million trees are dying of some punk disease imparted in that way; great elms that pleased our pas and mas are crumbling to the ground because such pests we do not slay. A little hustling out of doors might save the threatened sycamores, the locusts and the elms; so let us gird our loins today and spray our friends, the trees, and slay the worm that overwhelms. If you would sit supinely by and see a splendid shade tree die and never lift a hand, if you would raise no doleful sound when trees are dying all around, you surely should be canned.

# History of the Bureau of Plant Industry

United States Department of Agriculture.

It seems fitting at this time, as Dr. Beverly T. Galloway enters his position as dean of the New York State College of Agriculture, to review his long association with the United States Department of Agriculture, which he has just severed to engage in his new field of endeavor. Rising from the ranks until he became chief of the Bureau of Plant Industry, which position he vacated a little more than a year ago, to accept that of Assistant Secretary of Agriculture, Dr. Galloway has accomplished much for horticulture and floriculture in scientific research work. It is said of him that he was one of the first men in this country to realize the importance of pathological and physiological studies of plants.

In announcing his resignation as Assistant Secretary of Agriculture, a department bulletin says: "Dr. Galloway goes to his new position with an experience and an appreciation of agricultural problems that justifies the belief that Cornell University will continue the really wonderful progress it has made in agricultural science during the

past quarter of a century."

When Dr. Galloway came into the Department of Agriculture twenty-seven years ago he was greatly interested in the horticultural work, especially the intensive lines, as he had been for several years connected with floricultural work conducted by the Agricultural College of the University of Missouri. He had charge of the greenhouses for several years, and as these greenhouses were conducted on purely commercial lines, he took a deep interest in all of the problems confronting florists, problems of greenhouse construction and greenhouse management, and problems connected with the propagation of bedding plants and special crops, including roses, carnations and violets.

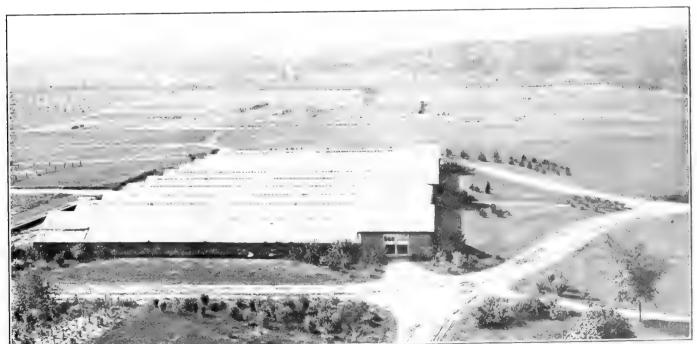

Upon coming to Washington his first work was in the field of plant diseases, especially those affecting fruit crops, such as grapes, pears, apples and other orchard fruits. The first successful treatment of the grape for black rot was made in 1888 at Vineland, N. J., under his

direction. The same year he was successful in preventing for the first time the serious disease of pears known as leaf blight. The next year the grape work was extended, as was also the work on leaf blight, in so far as affecting both the orchard trees and nursery stock. A special effort was put forth to assist nurserymen in the matter of protecting their stocks against diseases. Mildew affecting apple stocks, leaf blight affecting pear stocks, and various other maladies, which for years had greatly troubled nurserymen, were one by one successfully controlled.

In all this work it was necessary to develop special fungicides, and it was also pressingly necessary to develop apparatus with which to apply the fungicides. His department was the first to design and place on the market the American knapsack form of sprayer. This sprayer had been used in foreign countries, but no American type had been designed and placed on the market. The various forms used today are based largely on the earlier machines designed by the Section of Vegetable

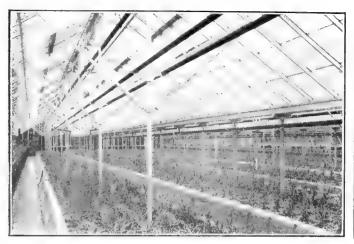

Pathology.

About 1890, in association with Mr. P. H. Dorsett, one of the assistants, he began some special work in the improvement of lettuce. They carried on this work for two or three years and published numerous papers on lettuce culture, especially as grown under glass. As a direct result of this work they were successful a few years later, through the aid of Mr. George W. Oliver, in actually producing several new types of lettuce by hybridization. Dr. Galloway regards this as one of the most interesting pieces of work with which it has been his pleasure to be connected. The work on lettuce, extending over a number of years, had very clearly indicated to him the need for a special type of lettuce for the Eastern grower and Eastern markets. There were no types that exactly met the prevailing conditions. They tested practically every forcing lettuce offered in this country and in foreign countries, and out of this testing work it was decided that

PART OF EXPERIMENTAL GROUNDS AND GREENHOUSES, BUREAU OF PLANT INDUSTRY, LOCATED AT ARLINGTON AND GREEN-HOUSES DEVOTED LARGELY TO PROBLEMS CONNECTED WITH FLORICULTURE AND VEGETABLE CULTURE UNDER GLASS.

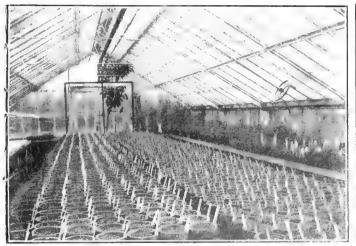

if a combination of two forms could be secured, it would published some important work in the improvement of approximate what was wanted in the way of an ideal the violet through definite selection effort. In connection lettuce for culture under glass. Mr. Oliver made this with this work and directly as an outcome of it developed

CARNATION CULTURE, ILISTING OF NEW VARIETIES AND BREEDING WORK.

ROSE CULTURE, HISTING OF NEW VARIETIES AND BREEDING

BREEDING WORK IN THE IMPROVEMENT OF GRASSLS

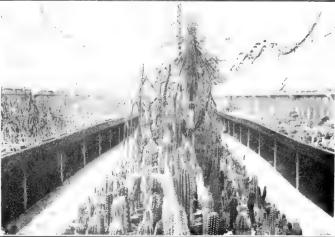

BREEDING WORK IN THE IMPROVEMENT OF COWPEAS.

ONE OF THE PLANT HOSPITALS CONNECTED WITH THE BUREAU OF PLANT INDUSTRY.

Later the work led into the field of violet culture, which was continued for five or six years and which resulted in clearing up and publishing an account of some of the most troublesome diseases of the violet, which hitherto had remained more or less of a mystery. There was also

PORTION OF HOUSE DEVOTED TO CULTURAL WORK ON DRY-LAND ORNAMENTALS.

the practice of using cyanide gas under glass. Cyanide gas had been used out of doors, more especially in California, but had not been applied to plants under glass except in a limited way. Experiments were made with a few violet plants at first and gradually the scope of the work widened until entire houses were successfully fumigated.

Associated with this work some other important lines were undertaken as affecting crops under glass by Mr. Albert F. Woods, also an assistant in the Division of Vegetable Pathology. Mr. Woods conducted some very important studies of lily diseases, and his studies of stigmanose, showing the relation of insects and cultural methods to diseases, cleared up a number of difficulties and made it practicable to control some of the more serious troubles confronting the carnation grower.

The work of the Division of Vegetable Pathology had developed at this time into a number of important fields, including the diseases affecting shade and ornamental trees, diseases affecting greenhouse crops, diseases affecting truck crops, and so forth. In 1901, upon the death of William Saunders, superintendent of gardens and grounds of the Department of Agriculture, the gardens and grounds were turned over to Dr. Galloway. This was the beginning of the organization of the Bureau of Plant Industry, coincident with the organization of several co-ordinate branches in the department. In 1902 the bureau was definitely authorized by Congress, and into this bureau was brought practically all of the plant work of the department, except that having to do with the forests.

Some of the most important developments that may be mentioned in connection with the growth of the Bureau of Plant Industry have had to do with proper educational efforts in the matter of pure seeds. The Seed Laboratory of the bureau has done most excellent service along this line. While its efforts have been to a considerable extent confined to cereal and forage crop seeds, a vast amount of work has been done on vegetable seeds, flower seeds, etc.

Ever since the Bureau of Plant Industry has been established it has been responsible for the securing, packeting and distribution of the so-called Congressional seeds. The Bureau of Plant Industry has never sanctioned this work, but has endeavored to conduct it in the most business-like way, because Congress in its wisdom has seen fit to authorize it. It has from time to time recommended and submitted definite and specific plans for changing the work, and out of these plans have developed numerous interesting and valuable adjuncts to the distribution. The work is especially designed for aiding the school-garden effort as conducted by Professor Corbett. Out of this work has also grown the very important foreign seed and plant investigations, already referred to. Furthermore, out of it has come the work it is now carrying on, having

PORTION OF THE FIELD STATION OF THE BUREAU OF PLANT INDUSTRY, CHICO, CALIFORNIA. GLASS HOUSE AND PROPAGATING SHEDS NOT SHOWN.

Early in the organization of the bureau the important field of plant introduction developed through the efforts of David G. Fairchild, who still remains in charge of this work. The world has been pretty well searched for new and rare ornamentals and other plants, and some of these are already making their way into horticultural prominence and others are likely to do so.

The breeding work of the department, especially that having to do with the improvement of fruits and ornamental trees, greenhouse crops, etc., has been continued so that the department and the Bureau of Plant Industry are now well equipped with up-to-date greenhouses for experimental work of all kinds. In this connection should be mentioned the valuable work conducted by Prof. L. C. Corbett, who for a number of years was in charge of the Arlington Experimental Farm. On this farm there is now a well-equipped establishment for the working out of many of the problems affecting American floriculture. The farm is well stocked with excellent material in the way of experimental orchards, vineyards, etc. It is on this farm also that Mr. W. W. Tracy conducted his important work in vegetable testing.

for its object the determination whether it is practicable to grow our own Dutch bulbs. The bulb farm at Bellingham, Washington, is making good progress along these lines.

Largely through the efforts of Dr. Galloway the department has now five well-organized, well-equipped establishments where it is conducting numerous important lines of work affecting horticulture and floriculture. On the grounds of the department proper, which consist of about 40 acres, it is now equipped with approximately 64,000 square feet of glass. In these houses it is conducting some of its most important work in the breeding and propagation of new and rare plants, experimental work in the feeding of floricultural crops, including the rose, the carnation and the chrysanthemum, the development of plants and the carrying on of an annual exhibit of chrysanthemums, largely intended for educational purposes. Several houses are also devoted to studies of the diseases affecting crops under glass. Other houses are devoted to the study of tropical and sub-tropical plants, others to the testing and fruiting of some of the tropical crops adapted to the United States, including the mango,

the banana, the orange, etc., and still others to plant quarantine work.

On the Arlington Experimental Farm, located about six or seven miles from Washington, is the second important horticultural plant, including about 24,000 square feet of glass. These houses are devoted to experimental work in the production of carnations and roses, the winter forcing of vegetables, etc.

At Yarrow, Md., nine miles north of Washington, is another well-equipped establishment designed for the care of the new and rare plants being brought in by the Office of Foreign Seed and Plant Introduction conducted by Mr. Fairchild. There are several greenhouses at this plant which are used for the propagation and testing of the new and rare shrubs, ornamental trees, etc., brought in from all over the world. There are also forty or fifty acres devoted to outside cultural work with ornamentals and other plants.

At Miami, Fla., there is a garden devoted especially to semi-tropical material. At this garden are propagated and distributed plants especially adapted to the southern United States. This garden will soon be greatly enlarged and is now well equipped with sheds and glass.

At Chico, Cal., is located the Chico Plant Introduction Field Station, consisting of about sixty or seventy-five acres of land, well equipped with greenhouses especially designed for the testing and rapid propagation of materials brought in from foreign countries in the way of shrubs, trees, and ornamentals of various kinds. The climate and soil at Chico are specially adapted to rapid propagation. While most of the crop production must be carried on under irrigation, the climate is so admirable and the soil so rich and strong that nearly all types of plants, whether suitable for the northern portion of the country or the southern portion, thrive well there. It has proved an ideal place for the propagation of many valuable things brought in through the Office of Foreign Seed and Plant Introduction.

#### SUCCESSFUL MUSHROOM CULTURE.

A crop that requires years of study and experience before the grower can be assured of a regular yield is mushrooms. The culture of mushrooms is somewhat uncertain from start to finish; in spite of all precautions

the crop may fall away below expectations.

Writing on the subject of mushroom culture, B. C. Blanchard of Canadian Horticulturist, says it is believed that where most growers fail is in the preparation of the manure. The equipment required is not expensive, any cellar will do that has a dry hard bottom. Mushrooms require darkness, but the few windows in the ordinary cellar need not be darkened. The bottom may be clay, gravel or concrete. If the clay is not dry it is best to concrete it. No heat is used in the cellars. A mushroom house should be as low as possible, convenience in working being a consideration.

Speaking of the successful methods used in mushroom growing, Mr. Blanchard says, the manure is treated for several months before it is put into the cellars. Only the very best horse manure is used. This is turned every day in the open for ten days, and the long straw all taken out. It is then turned every other day for a week. After that it is piled in ridges. Three weeks in all should put the manure in good shape. When ready a handful of the manure squeezed tightly should become

a solid ball, firm to the touch.

· For the winter crop the best time to prepare the manure is August. Although any time between April and the last of August will do. The manure is placed right on the clay or concrete in successive layers and tramped

solid till it is nine inches deep. The temperature will sometimes rise to one hundred and thirty degrees in two or three days, but when it falls to eighty-five degrees the

spawn should be planted.

Breaking the ordinary bricks of spawn into sixteen pieces is preferred. These are planted an inch below the surface of the manure, eight inches apart each way. The manure is tramped down solid and left for a week. After that a coating of rich loamy soil is applied, two inches deep, and pounded down till it is just one inch thick.

No attention need now be given to the beds for six weeks, when the mushrooms will begin to show. The first application of water should now be given, and the beds thoroughly soaked. They should require no more water until the bulk of the crop is off. When the crop begins to die away, another good watering will do till the crop is exhausted. A mushroom bed will usually crop from ten to sixteen weeks; twenty weeks is exceptional. Under good conditions a bed will yield from one to one and a half pounds to the square foot.

From seven to eight weeks after sowing the spawn the mushrooms will begin to lift. If sown in August they may run on till late in March. The dead manure is splendid for compost. About fifteen two-horse loads is sufficient for twelve hundred square feet of bed. The temperature of a mushroom house to give best quality should not fall below fifty-three degrees and not rise

above sixty-five degrees.

It is possible to take off two crops of mushrooms in one year, if a new lot of manure is put in as soon as the old is taken out. The old bed can be renovated without taking out the manure by spreading one and a half inches of dry cow manure and soil on top, tramping it well, and then adding one half inch of soil. This course is advisable only when one cannot wait and properly prepare the horse manure for the coming crop. Next to preparing the manure, the watering is most important. The two applications mentioned should be sufficient; too much water will kill the spawn.

#### SUNDAY WORK IN THE GARDEN.

It may seem like trival legislation to deliberate upon the question whether a man may lawfully work in his own garden on Sunday, but it is one that affects a great many persons and families, and we are glad that the House has taken it up and so far as it can has decided in the affirmative. Working in the garden is a healthful occupation for both body and mind. There are hundreds of men who have no other time in which to cultivate that small patch of real estate which means so much of comfort and contentment for rural homes. Men who are habitually industrious are not going to observe the Sabbath like an Eastern idol by sitting down and doing nothing. There is no better safety valve than a garden. It awakens a wholesome interest in the mind of the man whom it well serves, provided he can as well first serve it. There are doubtless many who, if offered their choice, would rather take a hundred-mile automobile ride on Sunday than hoe potatoes, but if they cannot do the former and are willing to compromise on the latter, the privilege should not be denied them. There is no better practical Christianity than that of the good old minister who said to his Sunday congregation: "Brethren, it looks like rain. I propose that we close this service and go out and get in Widow Scott's hay." If there were more gardens to occupy the time and appeal to the interest of men of enforced leisure, there would be much less business for the local courts Monday morning.—Boston Transcript.

# The Development of Boston's Park System

Boston's Park System was virtually established in the year 1875, through the appointment by the Mayor, under authority by the State Legislature, of a board of three

commissioners to serve without pay.

During the ensuing year plans were evolved for the establishment of a general system of parks and parkways surrounding the city. In the development of these plans the Commission obtained the advice of Frederick Law Olmsted, whose experience and success in similar undertakings in other cities made him an authority throughout

The original plans submitted called for the taking and improvement of about 1,100 acres at an estimated cost of \$4,000,000 for the purchase of land and \$1,000,000 for

improvement of same.

This general scheme has been adhered to, with minor exceptions, although considerable additions were made

later as the scheme developed.

The main features included the building of an embankment along Charles River, the connecting of Back Bay park lands with Boston Common and Public Garden by means of Commonwealth avenue, at that time a public boulevard; the development of land bordering Muddy River and Jamaica Pond, a beautiful sheet of water of about fifty acres situated in an extensive plain with a range of high hills on three sides, and the acquisition of an extensive tract of territory on high land in West Roxbury lying between the two valleys in which are the Providence Division and Old Colony Division of the New York and New England Railroad. This also included the taking of land about the Bussey Farm which had already been set apart by Harward University for Arnold Arboretum.

Next in importance was Marine Park at City Point, South Boston, between the main harbor and Dorchester Bay

The development of each division was carried with special reference to its surroundings and future uses.

The Back Bay Fens first laid out with the salt marsh style of landscape, while charming in its way, has of late years, through the damming of Charles River, changed is character from that of a salt water creek, cleansed by the ebb and flow of the tide, to a fresh water basin at a stationary level except when raised by heavy freshets. Sanitary reasons compelled therefore, the filling of the marshes and when properly loamed and planted we will have the unusual spectacle of a park whose entire aspect and design has been changed in the course of a comparatively few years.

The North Meadow has already been given the final touches and was selected for the site of the Convention Garden at the annual meeting of the Society of American Florists for 1914. It is intended, however, that the rest of the area of this park when completed for the second time, will be devoted to sports of various kinds, and although the change meets with opposition from many quarters, it will have many advantages as the surrounding property is being rapidly acquired for educational

institutions.

The Fen is connected with Olmsted Park by a narrow strip of land, called the Riverway. This area was developed in conjunction with the adjacent town of Brookline but it was planned as a unit and is a remarkable specimen of landscape work.

Olmsted Park contains three beautiful sheets of water. Jamaica, Wards and Leverett Ponds. The shores of these ponds are planted with rare aquatics and semi-aquatics, and on the steep slopes are banked rhododendrons, azaleas and mountain laurel.

The Arboretum, now famous all over the world, for its rare collection of trees and shrubs, contains about three hundred and fifty acres, and the work it is doing in collecting specimens of new and rare plants and investigating into their usefulness is of inestimable value to horticulture. There is a divided responsibility in the care and maintenance of this park as the planting spaces are cared for by Harvard University and the roads, walks, drains and material things are under the charge of the Park Department. As it is not a place for the gathering of great throngs of people the walks and roadways are narrow and winding, but are quite suitable for the small but earnest class who frequent the park on account of their love for arboriculture, or who are more keenly interested in botanical research. Grass trails lead one through the "Order," the "Pinetum" and other specifically arranged collections.

Franklin Park is considered one of the greatest municipal parks of the world. It has been developed at enormous cost and yet in its primitive condition when taken over by the city it possessed many natural beauties. Its plantations at that time consisted of what is known as 'second growth" woods, not of great size or splendor, but in conformation pleasing to the eve and remarkable for the dense massing of foliage. The illustration reproduced on the cover page shows the Scarboro Pond foot bridge in

Franklin Park.

The soil is underlaid with ledges of conglomerate formation which here and there form bold cliffs and rough barren patches showing distinct signs of glacial action; its boulder aspects are particularly interesting.

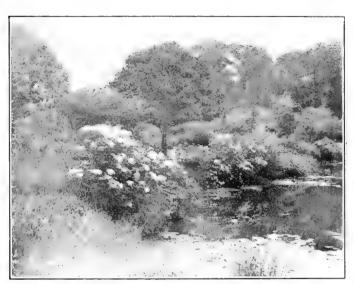

JAMES B. SHEA, DEPUTY COMMISSIONER, BOSTON DEPART-MENT OF PARKS.

The trees were the native oaks, chestnuts, birches, beeches and junipers. The newer plantations have been continued on the same lines and have been much admired.

As the topography is of the varied, uneven character many fine views result—those from Rock Morton, Hagborn Hill and the Overlook are well worth while to the visitor.

The park is practically divided in two by Glen Lane, an old public thoroughfare—the part north and nearer to the city itself, being originally intended for such forms of pleasure and recreation as appealed to the masses and for the establishment of restaurants, deer parks, and a possible Zoological Garden. This plan has been adhered to in the main, except that the Zoological Garden has taken on a greater scope than it was thought possible, having in recent years received the benefit of the income of the George Parkman fund, amounting annually to two hundred thousand dollars, bequethed to the city for park purposes. The larger part, however, south of Glen Lane, was laid out as the Country Park and affords a welcome

SAMBUCUS AT LILY POND ARNOLD ARBORETUM.

reception to those seeking a milder form of recreation or the solitude granted in the dense woods of the wilderness. or a long stroll over the broad meadows to Scarboro Hill.

The only activities are on the tennis courts in Ellicott-

dale or on the golf links.

Franklin Field, adjacent to Franklin Park, has become one of the most famous athletic grounds in the country. It is well equipped with ball grounds, tennis courts, bowling greens, cricket guards, a quarter mile cinder track, a half mile speedway and all other necessary adjuncts to the proper conduct of sports.

A narrow parkway leads through the populous district of Dorchester to the Strandway and Marine Park at South Boston, where one can enjoy all the delights of ocean scenery. Castle Island, containing old Fort Independence, is a very charming spot; here is also located

the Aquarium, recently completed. The Convention Garden is a unique institution which, it is generally expected, will be brought to a very high degree of perfection at the convention of the Society of

American Florists to be held in Boston in 1914.

The setting for the Garden in Boston's beautiful park system in cultured Back Bay district, is in the ten acre meadow south of the Richardson Bridge, one of the prominent architectural features of Boston's parks. The garden, once a feature of the gathering of florists, has been abandoned for many years back until it was resurrected last

WILDERNESS FROM HAGBORNE HILL, FRANKLIN PARK.

year at the annual convention held in Minneapolis, Minn. The display made there interested every visitor and was encouraging to the numerous delegates from the east, many of whom Leang members of the Boston Horticultural Club had previously discussed the establishment of such an exhibition.

The educational and aesthetic value of the Convention Garden can hardly be estimated—plants are shown which the general public would never have an opportunity to become acquainted with, and even from the commercial point of view, it would seem as if it would become of great value.

The Park and Recreation Department of Boston has been very generous in its attention to the interests of those

THE PINE TREE BANK AT OLMSTEAD PARK.

exhibitors who are taking part in the development of the scheme, preparing the flower-beds and caring for exhibits. It has also contributed generously by planting five or six of the largest beds, the central feature of which is a large circular bed representing the city seal.

In the lagoon bordering the Garden will be shown rare nympheai (among them Victoria Regis), nelumbiums and semi-aquatics and rare grasses for shore planting.

Many new varieties of gladioli, geraniums, roses and crotons will be shown. A large exhibit of fancy conifers will also be a feature of the Garden as will a lagoon effect after the Japanese style, pagoda, rustic bridges, etc.

It is generally expected that the Garden will be made a

permanent feature of the park system.

The growers of the country have responded generously to the request of the Garden Committee at considerable trouble and expense to themselves and have done all that is possible to make the affair a success.

Without doubt the Convention Garden will become a

FRANKLIN PARK PLAYGROUND.

permanent adjunct to all future conventions of the society, but there is an infinite amount of detail work which must be attended to and which should, as a matter of fact, commence in the autumn preceding the meeting, but experience renders all problems easy and the work undertaken at Minneapolis and Boston will be of great benefit to other

The development of this garden has been under the personal supervision of James B. Shea, Deputy Commissioner of the Boston Department of Parks, and to whom all

credit is due for the successful undertaking.

Born in Boston in 1863, Mr. Shea received his early education at Boston College. He took a course in landscape architecture at Lawrence Scientific School, Harvard College, and entered the Boston Park Department in 1891. Appointed assistant superintendent under the late John A. Pettigrew in 1897 he succeeded him as superintendent on Mr. Pettigrew's death in 1912. In 1913 Mr. Shea was appointed Deputy Commissioner of the Park and Recreation Department, which position he now holds under the following Commission: John H. Dillon, chairman. Thomas F. Galvin and Charles Gibson.

TOBOGGANING ON SCHOOLMASTER HILL, FRANKLIN PARK.

# Gardening the Oldest, Dancing the Most Ancient Art

This present epidemic of dancing-which began with the turkey trot, then changed to the bunny hug, Texas tommy, fishworm wriggle, Frisco glide and finally the tango-is the first violent appearance of social neurasthenia or hysteria since the fifteenth century.

The dancing mania of the Middle Ages did not assume the proportions of a social disease until July, 1374, when a frenzy swept through the town of Aix-la-Chapelle and whole mobs of men and women danced in the streets, screaming and foaming at the mouth.

This was kept up until they fell from exhaustion, and a great many of the dancers finished by beating their heads against walls until they heard the overture in the clouds.

The dancing mania had its greatest run in the German cities, but milder off-shoots reached out like caravans and extended into all parts of Europe.

Italy was hardest struck with this plague in the town of Taranto. It became known as tarantism, and was diagnosed by the physicians of that time as a contagious malady started by the bite of the tarantula spider.

The Italian doctors tried many ways of curing patients who had the dancing mania. They invented a very fast dance known as the tarantella, to the accompaniment of castanets and tambourines. The idea probably was to let the disease feed on itself, on the same principle that a certain dose of arsenic will kill, but an overdose will not.

It took 200 years for tarantism to run its course in the hot Italian blood, and historians recorded that the most effective plan discovered for curing dancing-mania was to bury the patients in the ground up to their necks.

Dancing is the most ancient of the arts.

Confucius mentioned it and it was recorded in that part of the Hindu Vedas written nearly 8,000 years ago.

It is found in three forms: warlike, religious and social.

The first dancing probably came as natural as breathing; in springtime youth became intoxicated with the joy of life and danced much as we see colts frisking about in pastures.

Warlike dancing began when the victors in battle leaped and shouted to express their satisfaction.

There is no primitive tribe where we do not find dancing of some sort to the rhythmic pounding on hollow logs or gourd-drums, or the beating together of sticks. When they haven't musical instruments, they clap their hands like darkeys at a breakdown.

Dancing is a pretty good expression of the people of a nation-warlike, sensuous, poetic or religious.

The Greek priests were shrewd enough to make it a

part of the national religion.

The waltz is the oldest of modern dances. It has been in vogue almost continuously since 1555 when, known as La Volta, it cropped out at Fontainebleau where Henry II. was holding court.

In 1810 there came a great revival of dancing in England. Raikes in his journal recorded that the sports of that day ceased lounging of mornings and practiced new dances, prancing about with a chair when a partner was not at hand.

Twenty-six years later, a dance known as the lancers swept into popularity. Four society girls picked it up in Turkey and inoculated London. Oueen Victoria was a lancers fiend and ordered it included in the dance programme at Buckingham Palace, where it still is retained.

Then came the polka epidemic of 1844, beside which the present tango craze is mild.

The polka was an old peasant dance, handed down with folk-lore. Josef Neruda saw a girl dance it in the Elbeleinitz market place. He showed it to some friends in Prague. From there it spread to Vienna and Paris.

Then Cellarius, a Frenchman, probably the greatest dancing master who ever lived, took the polka to London and cleaned up several fortunes with it. The newspapers said that he was kept so busy giving lessons that the one hour between 2 and 3 a. m. was the only time he had in which to sleep.

None of the freak dances of that time lasted. They were given names like ragtime music: Up Tails All, Lumps of Pudding, The Bath, The Ladies' Misfortune, Rub Her Down With Straw, and there was one dance called An Old Man's a Bagful o' Bones.

Here in America we have originated only one interna-

tional dance: the two-step.

Most of our other dances were devised by plantation darkeys-cakewalks, reels, clogs and breakdowns-and never "took" abroad, except on the stage.

The roller skating obsession of the early eighties put dancing in the background; and when roller skates got common during the nineties, dancing did not come backbicycles came in.

Then bicycles got so common that when they went by boys yelled "Ice!" and for a time it looked good for

But along came automobiles, and it was not until the novelty of riding in an automobile began to wear off that the recent revival of dancing began.

The tango did not originate in Argentine.

It came from Tango, Japan, a district on the southern shore of Wasaka Bay down on the west coast, where it originated some three hundred years ago in the city of Hashidate.

Hashidate, Matsushima and Miyashima are the Japanese pleasure resorts corresponding to our Newport,

Atlantic City and Tuxedo.

The music for the Japanese tango was strummed on an instrument known as the stamisen. When Argentine borrowed the dance from Japan and gave it plenty of advertising, they discarded the stamisen and hired brass

They also modified the dance just as a composer makes ragtime out of classical music by eliminating notes in regular combinations to get a syncopated, choppy, snappy effect.

Tango itself is an oriental word: the name of the Chinese dynasty that ruled from 618 to 905 A. D.

Nearly all sensuous dances originate in the hot countries, and Japan has been a rising point for rivers of dancing that sent out branches all over the world.

The famous side-show Hulu-Hulu dance of the Hawaiians was adapted from the Japanese sacred Hulu

We have all been reading of the great awakening of China, how the Chinese are striving to eclipse the Japs.

The success of the Japanese tango evidently made China jealous, for about the time the new tariff bill passed the Senate they exported a Chinese dance known as the tao-tao, which already is eclipsing the tango here in America.

"Hop light, ladies, your cake's all dough!"

-Exchange.

#### GROWING GRAPES UNDER GLASS.

The growing of grapes under glass in England is an old, well-established and extensive business. Moreover, it is in the hands of men who as horticulturists are second to none, and whose experience with the varieties they are now growing can be of material assistance to us in our endeavors along this line.

As this crop is grown under artificial conditions, the matter of climate is not so pronounced as is the case with imported fruits grown in the open; the chief difference, perhaps, being those of less atmospheric humidity, and greater light and heat intensity. Both of these conditions can be greatly modified by more frequent "damping down" and by the use of a light shade sprayed on the

A list of the varieties of Vitis vinifera would be legion, but perhaps 75 per cent. of the total glass crop of Great Britain is produced by only six or eight varieties. These varieties have proved themselves to possess in a marked degree the characteristics of vigor, prolificacy and quality. The varieties in question are: Black Hamboro or Black Hamburg, Muscat Hamboro, Alicante, Gros Colmar, Gros Maroc, Foster's Seedling, Mandresfield Court and Muscat of Alexandria. The last-named is liable to be somewhat shy in setting fruit under certain conditions.

The best way to grow the European grape is in a thoroughly drained and carefully prepared vine border, built within the greenhouse and along its sides. The young vines should be planted at least 12 inches from the wall, and if two rods are to be grown from each vine, the vines should be planted 8 feet apart, to allow 2 feet on either side of each rod for the growth of the laterals.

From a dormant condition the vines should be induced to break into leaf gradually. Undue haste at this time often spoils a crop. If budding out is slow or uneven, this may be remedied by laying the rods on the ground and syringing more frequently, or syringing with tepid water.

The average length of time taken to grow a crop of grapes from that of starting the canes into growth till the fruit is ready to cut, is usually from five to six months. It depends upon the time of year the crop ripens, after which the vines require a rest, and an opportunity to ripen the wood made. The grape crop is really a quick crop when compared with the crops of other hard-wooded fruits, but it requires continual attention. Successive annual crops are obtained only by experience, often of a most disheartening nature.

The writer spent several years with one of the largest commercial grape growers in England, who had considerably more than 12,000 linear feet of glass in grapes alone. Annually these vineries would produce crops of perfect fruit, and varying but little in yield from year to year. The estimated standard or yield for such varieties as Gros Colmar, Black Hamboro and Alicante was one pound of fruit to each linear foot of vine rod. Thus a vine bearing two main rods each 18 feet in length, making a total rod length of 36 feet, would be expected to yield 36 pounds of fruit.

During the time of flowering, the setting of the fruit is greatly assisted by gently tapping the canes once or twice a day. Sometimes a rabbit's tail, or soft camel's hair brush, is used to distribute the pollen, and a third

expedient is that of dusting the blossoms with Pampas Gras bloom, and so doing the duty of nature and the bees; this has been found to produce the desired result.

The grape is a heavy feeder (or in other words, to produce the best results, commercial fertilizers require to be liberally used). In connection with the use of commercial fertilizers though, the motto of the amateur should be "festina lente." A little at a time given regularly will produce far better results than liberal applications at distant dates. The grower should bear in mind the different requirements of the grape at different stages of its growth. During the first two months leaf growth is required, and the use of a nitrogenous manure such as ammonium sulphate is beneficial. Nitrate of soda is not quite so safe to use, especially in the case of vines growing in pots. Ammonium sulphate is best applied in solution at the rate of a quarter of an ounce to each gallon of water, twice a week. With vines growing in a border, the application is somewhat stronger, as watering is not so frequent as is the case with pot-grown vines.

When the fruit clusters appear the tips of the laterals are usually nipped off, leaving two leaves beyond the fruit cluster. During the flowering period and while the fruit is setting, feeding is generally withheld, though some growers with marked success use a little muriate of potash (KCL) at this time. With hard-wooded plants in pots, muriate of potash should be used with care. When the fruit is set and is about the size of small garden peas, sufficient leaf and wood growth should have been obtained and the further use of nitrogenous manure is apt to be harmful to the full maturity of the fruit.

The bunches of fruit at this period are thinned by means of fine pointed scissors. The smaller berries are removed and the remainder are thinned in tiers, so that each berry will have room to develop to its full size, and the whole bunch ultimately develop the form of a symmetrical cone hanging point downwards. At this time the energies of the vine are engaged in the development and maturing of the fruit, and the feeding of phosphates and potash in available form will quickly show beneficial results. When the fruit begins to color the proportion of potash may be slightly increased.

When using commercial fertilizers it is well to remember that underfeeding is a far safer course than liberal feeding, as an unduly heavy application may prove fatal. Lastly, certain varieties are very subject to sun-scald, and in this instance the variety "Lady Down Seedling" may be particularly mentioned. When any evidence of scalding appears on the berries, the shading should be increased, if this can be done without unduly hindering other vines in the same house.—A. G. Logsdail, in Canadian Florist.

### HOW TO GET A NEW LAWN QUICKLY.

In making a new lawn or grass plot, or renewing an old one, it usually takes an entire season to secure even a presentable sward. This gives the dwelling and surroundings an unfinished and undesirable appearance, which even the presence of flowering and foliage plants and vines does not entirely relieve or disguise—in fact rather accentuates.

To gain time and to secure a very presentable and attractive lawn or grass-plot in the short space of three or four weeks, writes D. Z. Evans, in Suburban Life, I have adopted the method of sowing oats with grass seed. The oats soon come up—in about ten days or two weeks,—and are kept cut down short to make the plants stool out well, covering the entire ground with a pleasing shade of green and giving the effect of a neat lawn, while the small and tender grass-shoots are maturing. The oat

is a perennial plant, and dies out in the fall, leaving the roots and crown to decay and furnish plant growth to the grass plants.

As this method can be used even as late as September, and in one case I successfully used it in October, when there happened to be a late fall,—a very satisfactory show of lawn can be had even though it is done well along in the fall.

In preparing the soil have plenty of good top-soil, free from stones and rubbish and finely worked over. Sow the oats freely, but not too heavily, as it will stool out considerably in rich well-prepared soil, and then follow with good lawn grass seed of known excellence and mixture. Thoroughly cover the entire bed with a light covering of fine, well-rotted manure, and then rake it over well, to cover the seed. If the season is dry, wet down the bed well by sprinkling—not flooding—and leave for a few days. If rain does not come in two or three days, give another wetting and then leave until the oats have shown nicely all over the bed. After the first cutting, which should be done when the blades are about five inches in height, see that the lawn is well watered; the same as an ordinary lawn.

In making over an old lawn, thoroughly break up the old sod and remove all the old grass roots and tops, after which treat it the same way as suggested for a new lawn. The above method will be found very much more desirable and far less expensive than having the lawn sodded with field sod, usually secured from places which have weeds of different sorts in it. Aside from this, such sod is old and often will turn out badly or die out soon, leaving the lawn spotted with bald places. The method I suggested is an easy one to secure a "quick" lawn, the growing oats also protecting the young and tender grass shoots until they are able to take care of themselves.

#### LIMITING HIS DUTIES AS GARDENER.

An applicant responding to a "gardener wanted" advertisement, being favored with an interview and informed by the lady that his duties would involve, besides the responsibilities of looking after the flower and kitchen gardens and the lawns, the care of two horses and three cows, looking after the chickens, act as chauffeur, assist with the inside kitchen work, tend to the furnace and make himself generally useful, inquired "And what sort of soil have you here?"

"Soil!" exclaimed the lady; "what has that got to do

with a gardener's position?'

"Well, replied the applicant, who proved to be an Irishman, "if it is clay I don't want the job, for I am afraid the gentleman may want me to make bricks in my spare time."

# The Service Bureau National Association of Gardeners

Is maintained for the purpose of providing opportunities for efficient and ambitious men engaged in the profession of gardening.

This department of the Association is at the disposal of those who may require the services of capable superintendents, gardeners or assistant gardeners.

Madison, N. J.

# Winter-Flowering Sweet-Pea Culture

By Anton Zvalonek.

The ideal soil for the sweet-pea is sandy loam. Red shell soil is very excellent if taken about six inches of the surface; and very coarse gravelly soil, if well fertilized, will also grow very good sweet-peas. Soil taken from swampy places, provided it is not heavy clay, but only black sediment, is very good if not used the same year. Such soil should, in the fall, be spread out about sixteen inches thick on high ground. Left there over winter, the rain and frost will wash out any alkali which the soil may contain; white clover seed scattered over this is also very beneficial. In about six months, or say in June, compost may be made of this soil by using one part of short manure to three parts of soil. Use some air-slacked lime and coarse bone.

For December and January cutting only large houses should be used so that the sun can penetrate every correre. In such houses it is possible to get satisfactory crops only during these two cloudy months. If you have not an up-to-date greenhouse, the sweet-peas should be sown later, say in October. Sweet-peas sown late this way will not bloom before February, at which time there is sufficient sunshine for a good flowering crop. All that is needed is eight feet of head room.

Solid beds of one and a half to two feet of good soil are the best. After the soil is well prepared in the beds, it should be well tramped down, and if too dry, watered down evenly to the base, leaving it for several days until

the soil is just in proper condition to work.

To prevent slow germination, soak the seed you intend to sow in water for about fifteen hours just before sowing. This will cause the seed to soften and swell o that when sown they will germinate quickly. Those seeds which still remain hard should be filed. The best method is to use a very fine flat file, taking one seed in each hand and striking it once or twice over the file just enough to cut the hard skin. The seeds treated in this way should be dropped back into the water, and within another fifteen hours they will be soft, swollen up and ready to sow.

When the beds have been well prepared as described above, press the soil down as firmly as possible, and rake everything off very smooth. Then make rows at least three feet apart and drop the seed about three inches apart in the row, not more than one and a half inches deep. Be sure before sowing the seed that the soil is in just the right working condition. Never sow seed in soil which is too wet and sticky; rather wait a few days until all is right. Moreover, never sow white sweet-pea seed in dry soil which has to be watered before the seed is up. Any seed of this variety, if sown in dry soil and watered very soon after being sown, will seldom germinate. After all the seed is in, rake the surface of the bed very fine for about one inch deep. This will make a very fine pulverized soil mulch on the top, which dries off soon, thus preventing the lower moisture from escaping, besides keeping the entire lower soil very cool, which is very needful to sweet-peas when starting. If these directions are carried out, no watering will be necessary for ten days at least, or at any rate as long as all the seed is not up, or so long as you can find moisture about four inches below the surface. Sometimes I have let three weeks elapse before watering the beds. This method encourages the seed to sink their roots deep in the soil, hunting for the moisture. Such sweet-peas, with deep roots, can withstand the hottest days without damping off, as is so often the case when the moisture is kept only on the surface. If it becomes necessary to water, you should water well down to the base, but not very often, keeping the surface rather dry and well worked. After sowing, the temperature should be kept as low as possible; and if the seed is sown in August, when the weather is extremely warm, the glass should be whitewashed slightly as long as the hot weather continues. Spraying the plants and glass from the inside between 11 a. m. and 4 p. m. also helps to keep down the extreme heat. After the sweet-peas are up the plants may be sprayed several times each day during such hot spells.

After the seed have been sown, keep the greenhouse as cool as possible, admitting air day and night as long as the weather will permit, and there is no danger of frost. The cooler it is when the plants are started, the stronger and healthier they become. It is necessary late in the fall to start firing, so that the steam and hot water may be turned in the heating pipes. Keep the temperature from 40 to 44 degrees Fahr, at night, never any higher, for if it is kept too high, the young plants will begin to bloom too soon, and before the roots have had a good start. Such plants, forced in this way, usually produce very small flowers with short stems. The Winter Sweet-Pea, if sown in August or later, when well grown should be at least thirty inches high before showing the buds. The higher they are in that stage the better the results. I would rather see sweat-pea plants four feet high showing the first buds than two feet. Sometimes during especially warm and bright falls the plants show the tendency to bud very early. In this case I recommend picking all the buds as soon as they appear. This will give the plants better root-growth for the later crop. After the plants are two and one-half to four feet high, they will all bud. This is the time to raise the temperature, increasing it every night by one or two degrees. If the temperature averaged 44 degrees, make it 45 degrees the next day, and so on until 52 is reached. This is the highest temperature for the older winter grandiflora at night. When in bloom, 60 degrees during cloudy days and 68 during bright days is best. All the new Winter Orchid-Flowering Sweet-Peas, in the first stage, need the same treatment as that just prescribed above for the winter-flowering sweet-pea, i. e., 40 to 45 degrees at night and 55 to 65 during the daytime, according to the weather, if bright or cloudy. But after these are in bud and flower, raise the temperature to 55 degrees Fahr. at night and 60 to 65 for cloudy days and 70 to 72 during bright sunny days. This higher temperature is necessary for the new strain, as the flowers are twice as large and the number of flowers to the stem twice as many; and the additional warmth prevents the falling off of the buds and causes the flowers to have brighter

Very often we hear of plants losing all their buds. To prevent this, keep an even temperature, especially during the night. If, during a frosty night, the temperature is 55 degrees Fahr, in the greenhouse, at seven o'clock in the morning the glass will be heavily frosted. As soon as the sun comes out the ice inside will begin to melt, causing a heavy dampness in the greenhouse. Many growers usually shut off the heating pipe as soon

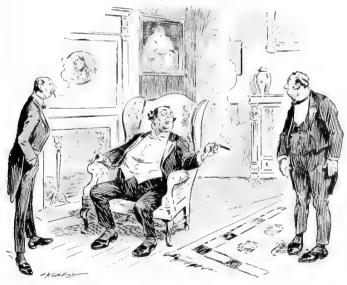

as the temperature begins to rise, but this should not be done, as the dampness thus kept in the greenhouse causes the buds to fall off. What should be done is to let the heat on for a while, but open the ventilator slightly so that the dampness may escape. As soon as the thermometer begins to rise one or two degrees, open the ventilator more and more, so that the highest temperature of 70 to 72 degrees may not be reached before 11 a. m. This should also be done gradually during the afternoon. From about 2 to 3 p. m. begin gradually to reduce the temperature by lowering the ventilator, never leaving it open until the temperature is entirely down to 55, but letting the ventilator go down by degrees.

If it becomes necessary to water, select only very bright days when you are sure that the ventilator may be kept open for several hours at a time. If, after watering, there is any sudden change in the weather, start the fires at once and leave the ventilators open as long as possible.

After the plants have reached the height of about six inches, they should be given something to climb on. The best method and the cheapest is to run one wire on the bottom and one from eight to ten feet above each row, connecting these two wires with strings as is done in the case of smilax. Strings should also be run lengthwise of the row, about every ten inches, as the plants advance in growth. At the same time it is well, occasionally, to help the vines to climb on the strings. upper wire must be one of the strongest, for when the sweet-peas are in full bloom they are usually ten feet high, and one row of one hundred feet will weigh a ton. If, at any time, the wire should break, all the flowers would become bruised, crooked and of very little value. In order to divide the weight, wooden or iron supports should be placed by the upper wire every eight feet.

After the sweet-peas have been in bloom for some time and have begun to shorten in stem, they should be fertilized. The best thing is liquid cow or sheep manure, or pulverized manure. Nitrate of soda should never be used, for it will do more harm than good. Another thing never to be used is hydrocyanic gas, for, although this destroys all insects, at the same time it destroys all the buds then in formation, so that there will be no flowers for many months to come.—Extracts from Anton C. Zvalonek's book on Sweet-Pea Culture.

#### MERELY A PRECAUTION.

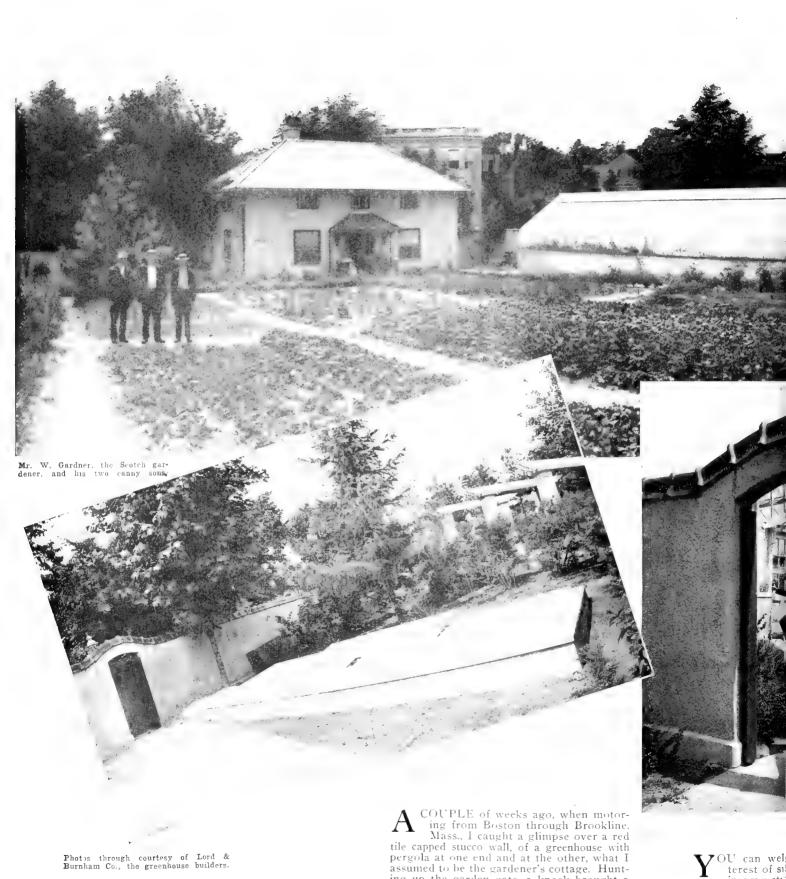

OLD ROXTON: The limousine, Peters! And Peters, owing to the present temper of the unemployed, leave out the cut-flowers!—Life.

#### ROOTING CUTTINGS UNDER BELL-GLASSES.

Comparatively speaking, there are very few hardy shrubs which cannot be multiplied by means of cuttings. It is not surprising, however, considering the great variety of shrubs cultivated in our gardens, that several different methods are necessary. Quite soft cuttings made of the young shoots of some shrubs will root during July in a propagating-frame with plenty of artificial heat. During August and early September cuttings made of the half-ripened wood do admirably in a close frame, preferably with a little bottom-heat. October is about the best time to insert cuttings under bell-glasses, as at this season the shoots made during the previous summer are fairly hard or ripe, and will make best plants.

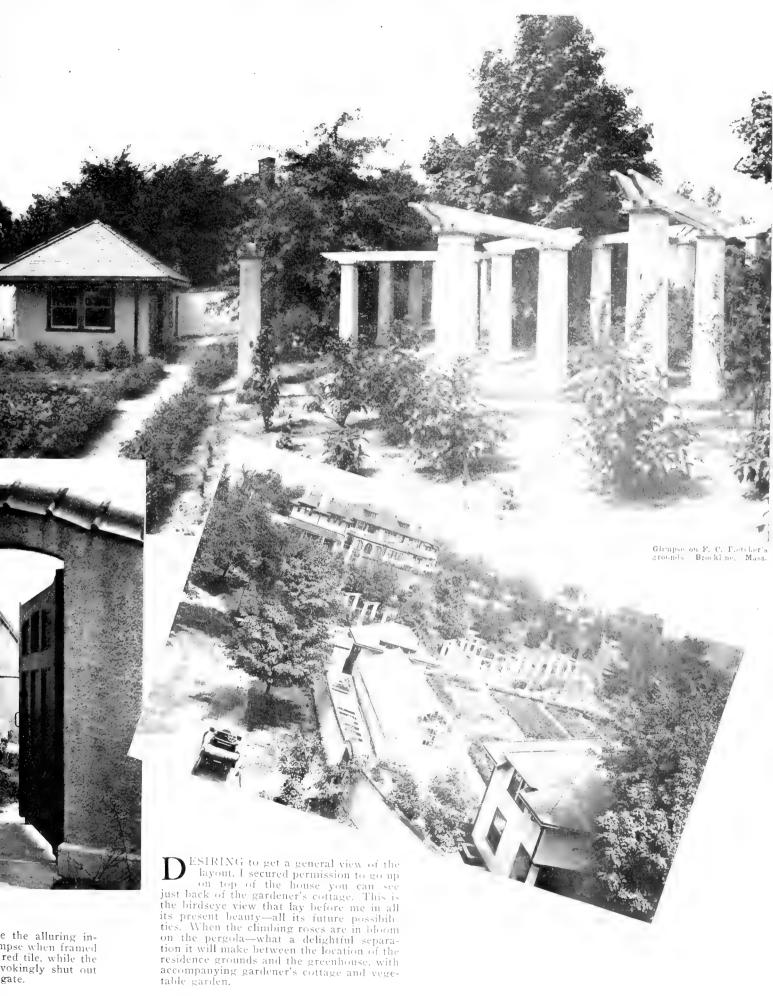

Choose a sheltered position under a fence or hedge, protected from the sun during the middle of the day, yet one where the young plants as soon as rooted obtain plenty of light. The soil should be well drained, light and sandy; if at all heavy, a raised bed of soil, kept in position with boards may be prepared. Place in the bottom 3 inches or rather more of rubble or clinkers for drainage; then fill up with 4 inches to 5 inches of light, prepared soil consisting of two parts sandy loam, one part peat, one part leaf-mould and one part coarse sand. Make the whole firm and level the surface, spreading over it a, thin layer of silver sand, which will trickle in the holes round the cuttings as they are inserted. For convenience of inspection and attention the prepared bed should not be too wide; a sufficient width to take three rows of bellglasses is ample. The bell-glasses vary in size from a diameter at the bottom of 4 inches to a foot. The size of the cuttings must of necessity vary in length and thickness according to the nature of the shrub, whether slender or stout in growth. An average length will be from 3 inches to 6 inches, inserting about one-third of this length in the soil. Whenever possible, the cuttings should be made with a fragment of the old wood attached to the base; this is familiarly termed a "heel." In most cases it is desirable to cut off 1 inch or 2 inches at the top of the shoot, the growth being tender or soft and liable to damp off in winter. With evergreen shrubs this is not so important, the leaves tending to keep the shoots fresh. Before dibbling in the cuttings, the bellglass should be placed on the prepared bed and pressed in the sand to mark the outside of the patch of cuttings. The number of cuttings inserted under a bell-glass will depend on the size of the cuttings and the amount of ground covered by the bell-glass. Under a bell-glass 4 inches to 5 inches across it is possible to insert forty to fifty Erica cuttings, as these are only 1 inch to 1½ inches long. A bell-glass a foot across will cover fifty cuttings of Tea Roses. It is not necessary to limit each bell-glass to one kind of cutting. Choose those which are similar in size and which take about the same time to root. Label each one carefully, and put the date when inserted on the label for reference. To prevent the cuttings flagging, rool them in a wet cloth as soon as they are cut off the parent bush; this will be found more convenient than placing them in water. The cloches used so much in French gardening will answer the same purpose as the bell-glasses; hand-lights may also be used. As it will be desirable to afford a little protection to the cuttings during severe frosts, the bell-glasses should be conveniently placed so that they may be covered. The cuttings should he well watered as soon as inserted with a fine-rosed watering-pot to settle the sand round the cuttings. Further watering will probably not be necessary more than once a month till the end of January.—The Garden.

ing up the garden gate, a knock brought a click in the latch and the jovial gardener let me in. Here is what I saw.

Vol. XVIII.

AUGUST, 1914.

No. 4.

As we go to press practically all of Europe is engaged in a terrible war. As to the justification of plunging nation upon nation into conflict in this enlightened age, to appease the wrath, or satisfy the desire of conquest, of a few monarchies, on this point there can be but one rational opinion entertained. We feel for the host drawn into battle and dread to think of the slaughter which must follow. The entire world will be effected by this overwhelming catastrophe with which the old world has been engulfed. How much the world will suffer, of course, will depend on the war's duration. European horticultural centers are threatened; in fact, battles have already been fought in the vicinity of some of these centers, so that interests with which many of our readers are closely allied must become serious sufferers. In a calamity, such as we are confronted with, there is little that can be done to relieve the distress of those involved. The prayer of our people should be that God guide those now engaged in sacrificing the lives of their subjects, to an early cessation of this unnecessary slaughter of mankind which some sovereigns appear to believe the Almighty really con-

The unsettled conditions which have been created by the European warfare suggest that man must be content with his lot as he finds it for the time being at least.

Those among the gardening fraternity who may be becoming restless as the summer season is drawing near an end and the fall season is approaching, seeking a change for betterment, or an opportunity for advancement, should consider carefully before vacating any position in which they may now be installed. Retrenchment is at the moment the uppermost thought in the minds of most men, and this includes those who are surrounded with life's comforts and luxuries. Few are thinking of expansion until the outlook becomes brighter than it is at present. Pessimistic utterances are not our strong forte, but the occasion warrants sounding a warning that this is no time to sacrifice a "sure thing" to take chances on an uncertainty.

We feel quite certain that the economical moods which materialize now and then on the part of our wealthy citizens are not always warranted or justified, but sentiment governs rich and poor alike, so when "hard times' are preached the rich man's nerves seem as much affected as those of his less fortunate brothers. We believe on the other hand, however, that we may console ourselves, no matter what the first effects of the war may be on this country, if adverse they will not be lasting, and that in the very near future it will enter into an industrial boom unprecedented in its history.

But few days remain before the horticulturists and floriculturists of the country will congregate in Boston at the annual convention of the Society of American Florists and Ornamental Horticulturists. The trip to Boston offers an exceptional opportunity both for education and for pleasure; in studying the outdoor plantings in the convention garden, the trade exhibits in the convention hall, mingling with fellow horticulturists coming from all parts of the country and visiting private estates and commercial establishments which are throwing their gates wide open to receive the visitors.

We appeal to all gardeners to make a special effort to attend the S. A. F. convention, and the meeting of their national association, which will be held at the convention through the courtesy of the sister society. Let the gardeners show their appreciation by having a largely attended meeting of their profession.

### LIFE AFTER LIFE.

Could I but teach man to believe, Could I but make small men to grow, To break frail spider webs that weave About their thews and bind them low. Could I but sing one song and lay Grim Doubt; I then could go my way In tranquil silence, glad, serene, And satisfied, from off the scene. But, all this disbelief, this Doubt, This doubt of God, this doubt of good. The damned spot will not out.

Wouldst learn to know one little flower, Its perfume, perfect form and hue? Yea, wouldst thou have one perfect hour Of all the years that come to you? Then grow as God hath planted, grow A lordly oak or daisy low, As he hath set his garden; be Just what thou art, or grass or tree, Thy treasures up in heaven laid Await thy sure ascending soul, Life after life—be not afraid!

Joaquin Miller.

### NATIONAL ASSOCIATION NOTES

M. C. EBEL, Secretary, MADISON, N. J.

# SUMMER MEETING NATIONAL ASSOCIATION OF GARDENERS, REVERE HALL, MECHANICS' BUILDING, BOSTON, WEDNESDAY, AUGUST 19, AT ONE O'CLOCK.

Through the courtesy of the directors of the Society of American Florists the National Association of Gardeners will hold its meeting in the building in which the S. A. F. convention is held on Wednesday the 19th inst., at one o'clock. All gardeners and those interested in the gardening profession, whether members or not of the N. A. G., are cordially invited to attend this meeting.

Several able speakers will address the meeting, among who will be Theodore Wirth, Minneapolis, Minn; William F. Gude, Washington, D. C.; James C. Kennedy, Boston, Mass; Arthur E. Thatcher, Bar Harbor, Me; Arthur Smith, Reading, Pa; and Harry A. Bunyard, New York, N. Y.

All members of the N. A. G. in position to attend the summer meeting should make a special effort to do so. The trip to Boston offers several days of pleasant vacation where the visitors will find much to entertain them. From the horticultural point of view there are few places to be visited in this country which will prove more interesting than the trip to Boston and its vicinity.

#### THE NATIONAL CO-OPERATIVE MOVEMENT.

The Philadelphia Florists Club appointed a committee on co-operation at its August meeting to work in conjunction with the National Committee of the National Association of Gardeners. With this club and the Gardeners' and Florists' Club of Boston, which appointed its committee some time ago, the movement now has two of the strongest clubs in the country, numbering many gardeners in their membership rolls, affiliated with it.

Practically all the local gardeners societies in the east have joined in the movement and several western societies have signified their intention of doing so this fall. The Redlands Gardeners' Association of Redlands, California, and the Texas State Horticultural Society, are among those which have enlisted to co-operate with the N. A. G.

#### NEW MEMBERS.

During the past month the following new members have been added to our lists: Henry Gibson, Tuxedo Park, N. Y.; John W. Baxter, South Dartmouth, Mass.; Hugh Lyons, New Rochelle, N. Y.; John Forbes, Davenport Neck, N. Y.; Walter Boggis, Convent, N. J.; John Scheepers, New York, N. Y.; T. Nelson, Stamford, Conn.; Frank Honeyman, Glen Cove, N. Y.; Angus MacGregor, Glen Cove, N. Y.

### AMONG THE GARDENERS

Alexander MacKenzie, superintendent of Mrs. J. Pierpont Morgan's estate, Highland Falls, N. Y., was a recent visitor at Glen Cove, N. Y., where he formerly supervised the Percy Chubb estate. Mr. MacKenzie

spent several days in his old community visiting many of his gardening friends.

Arthur Griffin, formerly of Newport, R. I., is reported to have accepted the position of superintendent of a private estate at New London, Conn. Fuller details are lacking.

Friends of William Kleinheinz, Ogontz, Pa., who sailed for Germany accompanied by his wife on July 4, trust that he will have no difficulty in leaving his fatherland to return to his adopted country. Mr. Kleinheinz expected to return about September 1.

Peter Duff, of Orange, N. J., one of the trustees of the N. A. G., who expected to return from his trip to Scotland in time to attend the summer meeting of the association, is reported to be finding difficulty in securing transportation home and it now seems doubtful whether he can return in time for the meeting.

John H. Dodds, of Wyncote, Pa., and Andrew A. Macdonald, of Somerville, N. J., are both on the other side visiting England and Scotland and expected to return early in September. They will probably find no serious difficulty to obtain transportation when their vacation is over.

J. H. Anderson, formerly located at the State School, Owatonna, Minn., has accepted a position of the D. O. Mills estate, Millbrue, Cal.

Alexander Shaw has resigned his position as head gardener to Judge William H. Moore, Pride's Crossing, Mass.

John R. Ness, of Brookline, and Peter Arnott, of Chestnut Hill, Mass., sailed on July 31 for an extended British tour. The Shrewsbury and Edinburgh shows will be visited.

Professor C. S. Sargent, head of the Arnold Arboretum, is one of the many detained abroad owing to the war. The war has prevented several gardeners in the vicinity of Boston taking their vacation abroad.

Edward R. Smith, formerly of Faulkner Farm, Brookline, Mass., has accepted a position as head gardener to Miss Myra Hall, Pittsfield, Mass. Mr. Smith was for three seasons a student in the landscape class conducted by the Gardeners' & Florists' Club of Boston.

James Methven, head gardener on the Van Brunt estate, Milton, Mass., is convalescent after a long and painful sickness.

Visiting members of the N. A. G. should not fail to look over the Boston Park system and Arnold Arboretum. At the latter institution the veteran Jackson Dawson will be glad to show courtesies to all visitors.

# The Private Gardener in Commercial Fields

The subject of our sketch, Chas. H. Totty, of Madison, N. L. was born in Shropshire, England, in September, 1873, and is now forty-one years old. In his early 'teens in common with most other youthful seekers after horticultural knowledge he served his three years apprenticeship and was passed along to Dickson's celebrated nurseries at Chester in 1890. He is at all times willing to bear testimony to the good that a young fellow derives from such nursery experience. He says a few weeks spent in getting up orders in a first-class nursery gives an observant young man an almost cyclopedic knowledge of plants, if his memory is good and he concentrates on his work. Too many of our American boys in this age of specialization never acquire even a speaking acquaintance with the numerous varieties of trees and shrubs, not to mention the thousands of varieties of orchids and stove plants, in cultivation at the present time.

After a year at Dickson's, Mr. Totty went to the Norris Green Estate in the hands of the Gladstone family, located at West Derby, Liverpool, immediately adjoining the estates of the Earls of Sefton and Derby. This establishment was largely known for the quantity of excellent fruit grown there and the training in fruit growing there received during his two years' employment, was a great help in rounding out his horticultural knowledge, which previously had been confined to plants and flowers.

In May, 1893, Mr. Totty came to America and secured a position with Mrs. F. F. Thompson, Canandaigua, N. Y., although this estate was not nearly so large at that time as it is now. In the spring of 1895 he returned to New York and drifted out to Pitcher & Manda's establishment at Short Hills, N. J., looking for a position. They sent him to the Twombly Estate at Madison, N. J., in which town he has remained ever since. He was largely responsible for the chrysanthemums exhibited from this estate from the year 1898 to 1903, which gave the name "Florham Farms" a world-wide reputation.

In 1903 Mr. Totty started into business for himself at Madison, buying out the Hart greenhouses of that place. His expert knowledge of chrysanthemums together with his extensive acquaintance among the expert growers of the country served him in good stead. In 1909 the opportunity presented itself to lease the Twombly Greenhouses, where he had taken his first position in Madison. This establishment with its large glass area and commodius packing sheds was just what was needed to take care of his rapidly increasing business.

From the first Mr. Totty has made a specialty of producing high-class stock of chrysanthemums, carnations, roses, and other novelties that show merit. In 1910 he was given the exclusive American agency for the Wells-Pockett varieties of Novelty 'Mums. It will be noted in any exhibition that most of the first-prize 'Mums are varieties that Mr. Totty introduced to the American trade

He is the introducer of the single type of 'Mums which have become so popular the past few years, and also the Early Flowering 'Mums, which are now almost as extensively grown as Geraniums. In reference to the latter type, he has this past year signed an agreement with August Nonin of Paris, France, by which he becomes

the sole American agent for this grower, who has done more than anyone else in the world to improve this Early Flowering type of Chrysanthemum. At the present time Mr. Totty has a great many Early Flowering seedlings under test at his Madison establishment.

While the catch-phrase "Totty's 'Mums' is world-wide, his novelty business is not confined solely to this flower. In 1911 he introduced the English rose, "Lady Hillingdon," to the American trade. In 1912, in conjunction with the E. G. Hill Co., of Richmond, Indiana, he distributed the French variety Sunburst. In 1913 he gave us the pink rose "Mrs. Geo. Shawyer," which is an English seedling grown by Lowe & Shawyer and introduced to the English trade by that firm. This latter variety seems destined to become one of the most popular pink varieties grown.

Mr. Totty is also the American agent for Hugh Dickson, Ltd., of Belfast, Ireland, for his Novelty Roses, and as "Dickson" is a name to conjure with we can hope to

CHARLES H. TOTTY

hear a great deal more of him in this connection in the future

Mr. Totty is an ex-president of the New York Florists' Club, and at the present time a trustee of that body; he was for three years president of the Chrysanthemum Society of America; in 1912 was appointed a director of the Society of American Florist & Ornamental Horticulturists. He was appointed chairman of the National Flower Show in New York in 1913, and his work in that capacity still speaks for itself.

#### NUT CULTURE FOR FUN AND PROFIT.

By H. E. VAN DEMAN.

There is an increasing interest in nut culture all over America, and very properly so. This is largely owing to a better knowledge than formerly of the value of nuts as an article of food and in some degree to an increase of production through their culture in the hands of intelligent and enterprising growers. The most valuable of all the native nuts of America is the pecan, known by botanists as Hicoria pecan. It is the best nut in all the world, so far as discoveries have been made, unless it be the cocoanut, which has a wider field of usefulness because of its oil used in commerce and manufacture. But for richness of kernel, delicious flavor and generally satisfying qualities to the consumer there is no other nut that is its equal.

Its natural range is from southern Iowa to Mexico, but mainly in the valley of the Mississippi and its tributaries. Unfortunately, for its general culture, the southern types of the pecan, which hear the best nuts, are tender in tree, and not suitable to the more northern sections. It was in Louisiana that the first efforts were made in pecan culture, and in the culture of any of our native nuts as well. This was done by the French and Spanish pioneers, who, seeing the excellent character of some of the wild pecans, planted them about their homesteads and some of those trees, now centuries old, are yet standing. But it was not until recent years that propagation by grafting and budding was undertaken. Now it is a common practice and the culture of many choice varieties is extensive and eminently successful in the cotton-growing area.

Stuart, Schley, Success, Van Deman, Pabst, Moneymaker, Alloy, Delmas and Frotscher are among the best of the choice varieties, and grafted and budded trees may be bought reasonably. They should be planted in rich land and not nearer than 60 feet apart, and 100 feet is a better distance.

But the culture of the pecan in the regions north of the cotton belt is a most desirable thing to attain and it is being attempted by selecting the choicest varieties of the hardier types of the species and propagating them by grafting on to seedlings of the same type. In the creek and river bottoms of the southern parts of Indiana. Illinois and Missouri there have been found a very few varieties that are reasonably large, thin shelled, that have plump kernels that come out of the shell easily and that are produced abundantly on hardy trees. These are being tested out and trees will soon be for sale by the nurseries, although it is too soon to list many varieties now. Indiana, Major and Green River are the best of those now known.

There is one species of hickory that grows over a large territory, from New England to Wisconsin and Missouri, that is well worthy of far more attention than it has yet been given. This is commonly known as the Shagbark or Little Shellbark, otherwise Hicoria alba. In quality of the kernels it is scarcely inferior to the pecan and some think the flavor even superior. The nuts are highly esteemed and find ready sale in the market at good prices. The size is somewhat variable and the shape also, but the nuts average about an inch in diameter and are oval or roundish in shape. The shell is reasonably thin and the kernels are not very hard to extract. There are a few varieties that are far better in all respects than the average and some of them have been named and are being propagated by budding and grafting them on to seedlings of their own species. Among these are the Rice, Kirtland, Weiker and Milford.

It is quite essential that the kernels and shells be of such character that they part easily, that the meats may be extracted in halves, for upon this point depends much of their value. There are many such kinds and they should be sought out and none others planted. Seedlings from them would be of more value than if any kind of hickory nut was planted, but there is no certainty and little probability that nuts of very superior value would be secured in this way. The planting of groves of hickory might be done with such seedlings or with the nuts placed directly where the trees are to stand. There are thousands of waste corners and little fields that could be covered with hickory trees at small expense that would change them into a condition that would be beautiful, profitable and lasting. Among the oldest of the cultivated nut trees is the walnut. The species that is commonly grown for its nuts, Juglans regia, is a native of parts of eastern Europe and Asia Minor, and was brought to France and the British Isles by the Romans centuries ago. In America it is commonly called "English" walnut, but Persian is a more suitable name and the one now considered proper. The early settlers in America brought it from England and France to our eastern coast and the Spaniards to the Pacific coast. Owing to climatic causes, in part, and others not well understood, there has been little development of the walnut industry east of the Rocky mountains, but on the Pacific coast it has grown to be a large and flourishing The walnut growers of California are in the lead, but Oregon and Washington are likewise adapted to the business, and many orchards are now being planted there.

In the eastern States there is wide opportunity for walnut culture, that is almost untouched. The climate of the Central States seems to be unsuitable to this tree, but there are many trees in the Atlantic States, both old and young, that are flourishing and bearing good crops of nuts. Some of them are in Pennsylvania, New York and New Jersey, and there is no good reason why there may not be thousands more planted with success. It is a neglected industry that will, in due time, it is hoped, be developed as it should be.

The varieties that have been planted in nearly all parts of the country have been seedlings, and for the most part of types that are rather tender. In general, those of the Pacific coast are not suitable to the Atlantic regions, but occasional trees have been found that are not only hardy but bear superior nuts in abundance. From these trees young ones are being propagated by grafting on native walnut stocks, chiefly of Juglans nigra, that are well adapted to the wants of planters in the Eastern States. Rush, Cumberland, Hayes and Pomeroy are some of the best. A few of the Pacific coast varieties seem to be suitable to eastern conditions, among them Mayette Frauquette and Wiltz.

The soil best suited to walnuts must be deep and rich, not low and wet, but well drained. Some bottom lands are very good if dry, but rich uplands of a rolling character are better.

The distance apart to plant walnut trees is about 50 feet. More would be better than less, because of the large size they finally attain. They will live and bear for a century or more, if planted in proper soil and climate and are well cared for while young. Walnut trees are well suited for planting among peach, plum and other early-bearing fruit trees, the latter being temporary and subject to removal when their room is needed.

Of the Asiatic walnuts there are several species, the

best being from Japan, but none of them have nuts of much value because of their thick shells and the difficulty in most cases of getting out the meats, although the flavor is delicious. Juglans cordiformis is the best, although not the largest of them. J. Seiboldi and J. Manchurica both make large and umbrageous trees and are very useful where shade trees are desired. All are reasonably hardy.

We have several American walnuts that make majestic trees, and their nuts are of excellent quality. The most conspicuous species is Juglans nigra, the common black walnut, and in stateliness and vigor of trees it excels all of the genus. While the flavor of its nuts is always good there are some of especial merit in this respect, and also in size of nut, plumpness of kernel and ease of extraction. A very few such have been brought to notice and will be propagated in due time.

The butternut, or Juglans cinerea, is another of our native walnuts that has very richly flavored nuts, but the shells are very rough and thick. If this species was crossed with J. regia the resulting hybrids would probably be of much value because of the hardiness of tree and superior flavor of the nuts.

### THE PERSIAN CYCLAMEN AS A BIENNIAL.

After numerous experiments during the last twentyfive years, I have proved, to my own satisfaction at all events, writes C. Blair in The Garden, that by far the best results with this grand plant are to be had by treating it as a biennial. I am aware that numbers of good gardeners disagree with this, holding that it is impossible to have really fine plants by this method. I am satisfied in my own mind, however, that with proper treatment quite large plants can be had in beautiful bloom fifteen or sixteen months after the seeds are sown. These easily beat the best old plants for size and substance of flower, while they also bloom for a longer period. Being very successful with this almost indispensable winter and spring flowering plant, perhaps a few notes on how I manage to obtain these satisfactory results may be of interest to others who admire the Persian Cyclamen.

In most cases seeds are sown at too late a date. Numbers of seed catalogues say that from October to March is the proper time. This may be well enough where a house can be devoted entirely to this plant, but for ordinary mixed culture it is much too late. I have always had the results by sowing from August 9 to 15.

Select fairly deep and perfectly clean seed-pans, those about nine inches in diameter being very handy. Crock with great care, and place some of the rough riddlings from the soil over the drainage. The soil should be a nice light, but fairly substantial mixture of three parts fibrous loam, one part flaky peat, one and a half parts sweet leaf-mould, and one part rather coarse, sharp sand. The addition of about half a part of crushed charcoal is a great help, as it keeps the compost sweet. Pass all through a half-inch riddle and mix thoroughly. Fill the pans to within about an inch of the tops, and make moderately firm and quite level. Scatter the seeds very thinly and evenly, and press down gently with a flat piece of board. Sieve a little of the soil and cover to a depth of about an eighth of an inch. Water carefully either by plunging in a bucket of tepid water or by using a very fine rose on the watering-can. Cover each pan with a sheet of glass, and the glass with thick brown paper or damp moss. Place in an intermediate temperature, and in about three weeks' time the first of the seedlings will be peeping through.

As soon as growth appears, remove the paper, but shade carefully from all sunshine. After all the seeds

of the choicest flowers not only perpetuates these colors have germinated, gradually remove the glass and get the pans set up on a shelf quite close to the roof glass. Here they should be kept all the winter, attending to them very carefully with water, but also taking care not to sour the soil by too frequent applications.

It is a mistake to attempt this too soon. Experience has shown me that February is early enough, and by then each little plant should have four leaves. Two-inch pots should be used, and these should be crocked with three or four small pieces of charcoal. A mixture similar to that advised for seed-sowing is suitable. Pot lightly and leave half of the little bulb above the surface, water, and return to the same temperature, shading carefully. Sprinkle gently overhead twice daily from the time of pricking off until September.

As growth starts in earnest, remove to a slightly lower temperature, and when the little pots are fairly well filled with roots (they must not be pot-bound), shift into larger pots. The very strongest may be allowed the 4-inch size, the others 3-inch or  $3\frac{1}{2}$ -inch, according to strength. Use much the same compost, only a little more peat may be given, also a 5-inch potful of bonemeal and the same of Ichtemic Guano to the barrowload of soil. Again pot lightly.

As the weather improves, admit air in increased volume and pay great attention to watering. Shade from all sunshine is imperative, as is the sprinkling overhead. Some good growers advise removing the plants to a cold frame during the summer; but, personally, I prefer a greenhouse stage. Tomatoes on the roof, not too thickly planted, afford the proper shade, and under these conditions the plants are always under the eye and thrive beautifully.

For the strongest plants provide perfectly clean 6-inch pots. For the medium specimens the 5½-inch size, and for the weaker ones 5-inch pots are best. The soil should consist of three parts best fibrous loam, two parts best fibrous brown peat, one and a half parts of sweet, flaky leaf-mould, and sufficient coarse sand to keep all sweet. Crushed charcoal may with advantage be added, while a 6-inch potful of bonemeal and a 5-inch potful of Thomson's Plant Manure or Ichthemic Guano must be allowed to each barro-load of the other ingredients. Use in a fairly rough state, as the idea is to provide a nice "springy" compost. Crock the pots with extra care and again pot lightly, keeping the bulbs half their depth out of the soil. Water carefully and keep rather close for a few days. As soon as the pots are well filled with roots, feed about twice a week with weak liquid manure and soot-water. A tablespoonful of Ichthemic Guano in a gallon of water is one of the best stimulants it is possible to have for the Cyclamen. Vaporise occasionally to keep down green fly and thrip, and in due course a fine display will be the reward for any little trouble incurred.

### GLOXINIAS FROM SEED.

Gloxinias may be had in bloom almost all the year by judicious management. When required for early flowering those that start first should be selected, carefully shifted into other pots and be kept near the glass as they depend much on light for a rapid and luxuriant growth.

Gloxinias can be flowered in the most satisfactory manner within six months from seed, writes H. F. East in *Canadian Florist*. Hence there is no longer the least temptation to propagate these plants by the lengthy and troublesome method formerly in vogue, especially as seedlings raised from a reliable strain produce flowers of the finest quality, both as to shape and style of growth. One great advantage to be obtained from seedlings is an

almost endless variety of color, for careful hybridisation but produces other fine shades also. Those who have never seen a large and well grown collection of seedling gloxinias have yet to witness one of the most striking

displays of floral beauty.

There are three distinct types of gloxinias and all need exactly the same treatment. The drooping strain is the oldest, and is gradually giving place to the horizontal, and the erect classes. They display their flowers to so much greater advantage than the drooping class that there is good reason for the increasing favor shown to them. It is not generally noticed that quite as much has been done for the foliage. The best strains now produce grand leaves which grow downwards and inwards in such a manner as almost to hide the pot so that its foliage has an extremely ornamental appearance. Those who care for a display at Christas can have it from seed sown in June, and further sowings late in the year should produce plants to flower successively in almost every month of the year.

The soil most suited to gloxinias is light porous compost of fibrous loam. If that is not obtainable leaf mould will answer, mixed with peat and silver sand in equal parts. New pots are advisable, or old ones must be thoroughly cleansed; free drainage is essential to success. Fill with soil to within half an inch of the top, sow thinly, and slightly cover the seed with very fine earth. Place the pots in a warm, moist position, carefully shad-

ing from the sun.

A light sprinkling of water daily will be necessary. Immediately some plants are large enough for shifting, lift them tenderly from the seed pan so as to least disturb the rest, and prick off into two inch pots in which the soil has a convex surface. Follow this process as plants are ready until all the seedlings have been transferred. When potting allow the leaves to rest on the soil, but avoid covering the hearts. On the first warm day give air on the leeside of the house, briefly at first and increase the time as the flowering period approaches. A clear space between each plant is necessary to prevent the leaves of neighbors meeting. The final shift should be into four inch or four and a half inch pots, unless extra fine specimens are required, and then one or two sizes larger may be used. An occasional dose of weak manure water will also be beneficial, taking care that the foliage is not wetted.

#### THE MIDSUMMER FALLOW.

By Karl Langenbeck.

Wheat has now been very generally harvested and the returns, in most all sections, are very gratifying. Where the harvest has not come up to expectations, the trouble has been due to specific causes in individual fields, rather than to general ones. Of the chronic causes, it is unnecessary to speak. But, many cases have come to my notice, in spite of good husbandry, where the wheat had fallen and the grain could not develop and ripen. The general conditions were, however, so favorable that fields in which there was trouble with weak straw, and which were predicted not to yield more than fifteen or eighteen bushels, gave thirty.

Men who succeed are always men who learn from failure. They are not those who throw up their hands and say, "farming is such a complicated business that you can not know; buy what fertilizer you can and let it go at that." Was your drainage right? If there is doubt about it, invest in some tile for the new field and put down a couple of lines. But get advice about it. Put in the tile where the labor will cost least and yet work it with a complete system to be carried out section by section in the future. If you own the farm, do some of this rather than spend all your money for a hand to

mouth fertilizer purchase. If you are a tenant, squeeze the owner to do this, or a part of it, for you. Don't let the demonstration of this failure slip by without pulling him up to do his duty in bringing up his land. If failure does not lie here, are the soil and subsoil of the new field you are plowing like those of the old? If so, and wheat is in the rotation, stop before you decide to put it in. You have time, before seeding, to get advice from your State authorities. Some other crop might be safer.

If you are plowing under a sod or manuring heavily, and your soil has not been limed for some years, remember that the condition under which decomposition bacteria, which convert them into humus, thrive best, is in land that is sweet. This is a most important matter for the summer fallow is short. The best men started in plowing at the earliest moment, even at the expense of inconvenience, to gain time for it. From the desirability of quick sweetening, so as to leave as much time as possible for undisturbed bacterial humus-making, the most soluble and quick acting lime is by all odds the cheapest, in spite of greater first cost. This is the hydrate. If properly spread on the sod and turned under, one third of a thousand pounds per acre dressing will be taken up almost immediately by the soil moisture and cut the acids. The rest will follow by diffusion and chemical action so quickly, even in dry weather, that carbonate can not be detected in 8 weeks time. Lime, when ground, or as hydrate, is best spread on a sod and plowed under with it. Or, if plowing is already done, it should be put on and harrowed in as soon as possible. If you have already manured, however, do not lime until after a rain has leached the animal matter into the soil. Else you will lose ammonia. Summer liming should be light, not over half the late Fall or early Spring practice.

SPECIMEN RHALIS LLABELLIFORMIS CHINA RATTAN PALM. GEO W. HESS, SUPERINTENDENT U.S. BOTANIC GARDEN, WASHINGTON, D. C., IN FOREGROUND.

# An American's Glimpses of European Horticulture

By Mrs. B. Hammond Tracy.

As for nature's flower show in England, it began as soon as we landed on the Devonshire coast. From Plymouth to London, the crimson clover gave us our first real idea of Crimson Clover. A deep rich crimson, with no mauve tinting, the flowers smaller and longer than our red clover. In this locality, the terra cotta soil, brilliant in the sun, and the rocks of even redder sand-stone were most unusual. Here would be a field all fresh green, with some spring crop, and perhaps next to it, one of these red fields ready for planting and the effect against a background of towering red rocks, with the blue sea in the distance, was indeed beautiful. These fields showed a most remarkable preparation, so thoroughly worked as to look as if they had been hand raked.

Fields and plots upon the downs, or rolling hills, as we would call them, were laid out as if by landscape architects, in plain geometrical figures, outlined by hedgerows. This was brought about by the division of property, in cases of large families, or many families in one location, and each has a little plot here, there and everywhere. One learns in England to appreciate the hedgerows. Every landowner, large or small, is so very proud of them, and they are cared for religiously, far more so than are the stone walls on estates in this country. There are hedgerows of Hawthorn, hedges of Spirea and of a low-growing shrub, which no one seemed able to name, but the branches intertwined themselves until it was quite impassable.

Nature is kind in England, for ivy covers everything. Trailing over unsightly tree trunks, over fence posts and carpeting the bare ground. It made one envious to see it growing so lavishly when we have to struggle so

hard to have it in our homes.

English landscapes are beautiful, but I cannot truthfully say that nothing so fine can be found in America. To be sure, England is older in the art of landscape architecture, and years and years ago, when her trees were planted, they were planted with a thought for the effect they were to produce. We wondered, too, why trees, almost without exception, were so symmetrical. This is due in a measure to the absence of sweeping winds and severe winters. So many of the plantings of trees, just out in the pastures and fields, were planted in round or oblong clumps. These clumps, with each tree a specimen, made a wonderful effect, as you looked over the downs, from some rise of ground. On investigation, we learned that these were planted in this manner for the effect they would produce. Government ownership of all wooded land must have great influence upon the preservation of these trees, and the natural beauties of England. All estates are bought separate from the timber. After a sale is made, the trees are appraised, and the buyer must then pay the government for the trees. Even shade trees above a certain size are liable to appraisal, and no tree may be cut down without a deal of red tape, in gaining permission to do so.

An afternoon spent at Ascot House, one of the estates of Leopld de Rothschild, was of unusual interest. It is to be expected that the horses will hold first interest, but next to the horses, I believe the natural beauties have second place in the hearts of the owner, who spends much time there. The estate at Gunnersbury is noted for the magnificent greenhouses, but at Ascot House,

nature is supreme.

The color effects of the trees in the wooded parts of this private park and around the lawns of the house were especially noticeable. The golden conifers, the white and red maples, nearby the white barked birch, trees of holly, the dark glossy green leaves next those of the variegated-leaved variety, planted among darker foliaged trees, made an effect which we cannot attain in America because of our climate and our winters. Many of these trees will not live here, though the varying colors might be produced with shrubs.

As we came near to the house, a by-path led to a crossing of two paths. At the intersection of the flag stones, or rather in one corner of the intersecting paths, stood an immense weeping birch, ages old. Trained branches formed arches over the four paths and the long trailing stems gave a tropical effect. One of the paths led to the winter tennis court, surrounded on four sides by a towering hedge of Box. Another led to the sun dial lawn.

Perhaps with the aid of keen imagination, a description may give a slight idea of this lawn. A plot of ground about 150 feet square, the hedge of the lawn tennis court for one background, and a lower box hedge on two other sides, the remaining side open to the main lawn and terraces stretching away in front of Ascot House. In the center of the Sun-dial lawn, the numerical figures of the clock were planted in box, each figure about one and one half feet high and five feet long—living, growing hours, and around this living clock, was the motto, also of Box, "Light and shade by turn, but Love always."

No one of our party seemed inclined to talk, as we looked at this truly beautiful bit of topiary work. It was an absolutely perfect spring day—the birds and every living thing seemed attuned, and these lines came

to me.

"The kiss of the sun for pardon,
The song of the birds for mirth,
One is nearer God's heart in a garden,
Than any place else on earth."

EAST TERRACE, WINDSOR CASTLE, LONDON, ENGLAND.

All visitors to England are privileged to visit certain portions of the grounds about Windsor Castle, but we were especially favored as we had for our guide, the King's gardener, and his formidable looking bunch of keys, opened many doors closed to visitors. The greenhouses were regal in more than name. Those for the finer flowers were built in the most modern and magnificent style. The floors were laid in mosaics and every inch of space was immaculate. Two houses will long be remembered. The croton house was a marvel of coloring, every sort and color of croton, grown in the finest way, but the intense heat made it impossible to stay long. The other was arranged in a color scheme one does not often see in a greenhouse. All in shades of rose and purple, from the dainty schizanthus, the coral begonia, bouganvilleas against the side glass and

banked in the corners, while from the back of each, on rows of shelves (for the plants were all grown in pots) trained fruchsias were growing. Just the common everyday fuchsias, both single and double, trained up the sides until they reached the roof and then grown along a trellis to the center of the roof. The green foliage massed against the glass and the great trusses of purple and rose

bloom hanging down.

There were greenhouses for grapes, figs, strawberries and nectarines, all showing the same expert cultivation. The kitchen gardens were most interesting, and here as in every garden of any size, we saw the fruit trees trained against the garden walls. Peaches, cherries, apples and plums, immense trees and all heavily fruited. For protection against what frost they have, large hooks were fastened into the wall, from which canvases were hung when needed. The pear tree pergola, surrounding a portion of the vegetable gardens was a feature. Pear trees, with trunks measuring a foot or more in diameter. were trained over an iron trellis about five feet high, and the trees were set full of fruit. In the hot beds, we found our sweet corn, growing as a "specimen," which would soon be transplanted to the flower garden. In several other localities we saw it growing in this environment, as we would use the tall ornamental grasses.

The grounds about the castle are kept most immaculate, and as we walked toward the Long Walk, we had glimpses on all sides of the two hundred and forty acres of handmown lawn, mown either by hand or horse machines.

Gatton Park, the home of Sir Jeremiah Coleman, is considered one of the most naturally beautiful places near London. Historically famous even before it was given to Anne of Cleves after her divorce from Henry the Eighth, and later the home of the Countess of Warwick, the beauties and attractiveness are not easily described. Three thousand acres given up to such an artist in landscape gardening as was "Capability Brown" would of necessity be productive of magnificent effects, but any one looking for formal landscape effects would be disappointed. Many minds and hands have had a share in achieving the present natural beauties, which have always been the prominent motive. The noble clumps of trees on a distant hill, the massed foliage and the sweeping lines of the surrounding country, give an unusual beauty to this country seat.

As we stood on the broad terraces in front of Gatton Hall and looked across to the wonderfully green wooded hills, Sir Jeremiah told us the history of three lakes, which were in our line of vision. The river Mole runs through the estate and "Capability Brown" caused the water to be piped under ground to the first lake, then again under ground to the lake in the Japanese Garden and still under again to appear in another much larger lake far off to our left. Looking across this lake, we saw the hills from which the world's supply of fuller's earth is taken.

One might wander for hours through the different paths and walks, either to the typical English chapel, where the family attend church each Sunday or to the greenhouses where the famous Coleman orchids are grown, to the Japanese Garden, or to the walled in Rose Garden, but everywhere the same tone of natural beauty would impress you. Whatever had been done, whatever device used to produce the desired effect, the result was purely natural.

In the lightly wooded parts of the park, as in so many of the park-like estates, we came upon such pictures of naturalization, here a perfect sea of blue bells and peasant-eyed narcissus, or sheets of purple crocus near great patches of pink hepatica. Honesty, with its rich violet and white blossoms was prominent in many places and

the hardy yellow allyssum made a fine carpet beneath

the purple Iris.

Ruskin said that gardens as well as houses should harmonize with the surrounding country, certain hues for the simple blue country of England, others for the glorious country of Italy, and in an Oxford lecture we find this sound advice—"bluish purple is the only color which nature ever uses in masses of distant effect, with the pale shades of rose or primrose to give undulations of color." This seems everywhere to be the key-note of most English plantings. Even the shadows are English shadows, blurred, uncertain, blue. To be sure there are many exceptions, but one sees such an array of these blue flowers, that envy vies with admiration, for not many blue flowers thrive with us.

In the R. H. S. Gardens at Wisley, the deep blues of the Larkspur, with long lines of Madonna lilies, made a picture well worth copying. Here also the Iris Orientalis with spirea and day lily, planted around a natural pond, was ideal. Madonna lilies along a pergola, over which climbed deep red roses, gave an admirable suggestion.

Gardens of one color require a deal of thought in the planning, but one lovely riot of color was produced by shades of mauves, purples, cool pinks and white. That of Lord Brownlow at Ashridge, purple and blue of Delphiniums, with later summer blooming of blue salvias, purple clematis, purple phlox, purple gladiolus.

This combination of purple and blue does not appeal to some, but a garden in yellow, pink or rose might be

worked out, avoiding any possibility of monotony.

At the mention of Iris, an endless range of color pictures comes to mind. Lavenders, blues, bronzes and yellows. One beautiful border planting was made up of these shades of Iris, and the columbine in the same shades, with tufted purple pansies carpeting the foreground. The columbines blossomed above the Iris and gave the planting a light airy look.

The marvels of lilacs which the late Victor Lemoine gave to the world, provide a sumptuous background for all the late flowering tulips, and were well used in English gardens and parks. Bushes laden with lilac blooms, surrounded at the base with plantings of cottage or Darwin tulips in pink, lavender or light yellow, were seen in the Hampton Court gardens.

Leaving England for Germany, the direct route to Hamburg has very little of interest from Flushing, Holland, across miles and miles of flat country, acres and acres of grass land with very few settlements. These tracts of land are traversed in many directions by roadways, long and straight as turnpikes, and bordered on each side by poplars. The effect of these long avenues was most unusual, for there were few other trees in sight. We could tell when we were approaching any city or town, by the large plots of small settlement gardens, which were intensely interesting. Apparently the ground was set apart by the city governments, for the use of the laboring classes, on which to grow their vegetables. Nearly every plot had on it some sort of shelter, either a rude shack, or a really artistic little garden house. Flowers were growing in many of the plots, and the tree roses were seen everywhere. In these rural districts, the fruit trees, planted along the highways, as are our shade trees, are under municipal control, and when ripe, the fruit is sold, on the trees, at auction.

Horticultural interest at Hamburg was mainly centered in the suburban districts. At Halstenbeck, about nine miles from Hamburg, are the largest tree nurseries in Europe, and it looked as if here might be grown trees enough to reforest the world, but the United States takes practically the entire stock grown on these 20,000 acres

of seedling trees. We motored through about 400 acres. In different sections were storage houses marked for our different states, and in the vicinity of each building were grown trees best suited to the climate of these states.

As you know, a seedling tree is a most infinitesimal thing, and the weeding process is of great importance. This weeding is done by women and from six to eight women are watched by one man, who does nothing but watch. Here, as all through Germany, we were constantly reminded of the rhyme,

Germany for the men, England for the dogs, America for the women.

THE FAMOUS PALM GARDEN, FRANKFORT, GERMANY,

I believe no one visits Hamburg without hearing of or visiting Ohlsdorf, the largest and most beautiful cemetery in the world. This wonderful God's Acre is the pride of Hamburg. It was planned when landscape architecture, in connection with cemeteries, was unknown except in America. Two thousand acres given up to beautiful out-of-door pictures. Even the graves of the poor are skilfully planted to avoid all barrenness. As you walk along the winding paths and drives, trees, shrubs and flowering plants attract first attention and for long spaces there is no sign of grave or monument. The collection of conifers is very rich and is arranged according to the country of its origin. Flowers bloom all the year round, from the Christ's Rose in the snow to the late Dahlia and Chrysanthemum.

Leaving Hamburg for Quedlingburg, the beginning of the seed producing district of Germany, you realize why it has been called the land of glorious flowers; also why Billings said, that if you should put an Englishman into the garden of Eden, he would proceed at once to find fault with it; put an Irishman into it and he would want to boss it, but put a German into it and he would begin at once to plant it. This spirit of planting is everywhere present.

In Brunswick, a city of 144,000 people, the main rail-road station stands on one side of the large city square. As you approach the station from the street side, you see only the upper story and roof, the lower part is hidden by the gardens. Entering these gardens through great gates, fine specimens of palms, bays and shrubs are seen. The porches and loggias are all decorated with palms and bays and in the midst of all this greenery and bloom, for it was Rhododendron time, lunch was served to our party. With the garden all around us, and the busy city streets in the distance, we had no consciousness of the puffing engines in the train sheds behind us.

Through all the western part of Germany, the banks of the railroads are heavily grassed over, not bare gravel

banks, as so common with us, and all through the grass, the blue salvia, the bright red poppies and the bachelor button blooms are seen. We were truly in Emperor William's country. It was a pretty sight but it was beauty with a dangerous element, for this flower beauty reaches the farms of the peasant farmer and literally ruins his crops, especially any hay or rye fields, for the stock will not touch the poppy. It is even worse than our daisy.

As we came nearer to Quedlingburg, in Prussian territory, we saw the poppy under cultivation in the market gardens. All gardens are planted in rectangular plots, and the poppy plots, one blaze of red, with scarcely any foliage showing, gave a very gorgeous patch-work quilt effect. They cultivate the poppy for the medicinal qualities, and if gathered before the seed ripens, all well and good, but disaster in the adjoining fields, if they ripen before harvest.

Quedlingburg, in the heart of the Hartz mountains, and only a few miles from Thale, is a fine admixture of the ancient and modern German city. It is very popular as a summer resort and doubly attractive because of the mountains and the flower farms. The parks are richly planted with Rhododendrons, and the inevitable pansy is everywhere.

The electric poles are tastefully decorated with circular "window boxes," bright geraniums and trailing vines, just out of the street urchins' reach, contrasting nicely with the dull green of the poles. In this great seed producing district, all kinds of flowers are grown for seed, but pansies by the yard, by the acre, yea, by the mile. In seed catalogues, the name of Roemer stands for pansies, and we walked over a few of the

ONL OF THE PLANT SHOW HOUSES, PALM GARDEN AT FRANKFORT.

fields where the Roemer pansies were grown, led by Mr. Roemer, blind now after years spent in perfecting the pansy. He would bend over some choice variety and tell us the name and its good qualities, then turn to his son, who guides him, and ask for corroboration.

Erfurt, a short distance from Quedlingburg, was, in the middle ages, one of the wealthiest German cities. It now calls itself the City of Flowers, although its market gardens surpass any in the world. In the beauties of this modern city with the fields of flowers on every side, one forgets that it was here that the monk Luther struggled through to his God. Just a little way into the fertile lowlands, the celebrated cauliflower is grown, and the ditches themselves yield the equally famous water cress. I think one associates Erfurt especially with vegetable seeds but the flower seeds are really its greatest industry. It was flowering time, with many seeds ripening, so that we had a fine opportunity to see the seed gathering.

Bingen, surpassingly fair Bingen, came in our line of travel, from Germany to France, and we were awed, as every traveler must be, by the beauty of the scenery. The peculiar deep tone of the green foliage on the heavily wooded hillsides contrasted beautifully with the gray green foliage of the vineyards, and this succession of vineyards, separated occasionally by these wooded hills, continues along the shores of the Nahe as far as Frankfort on the Main. Here no one fails to visit the Palm

VIEW OF GARDEN, PAUAGE DU PETIT TRIANON, VERSAILLES, FRANCE.

garden, which, I believe, is considered the finest in Europe, if not in the world. Certain it is, that here are found specimens of Palms, of wonderful growth and without mark or blemish. This Palm garden or park, is owned and controlled by private individuals, and this accounts for the high character of the place. Absolutely clean in all its phases, and with model cafes, and music such as one hears only in Germany. No rag time, but really good music which every German loves and appreciates. The whole tone of the place is highly educational. Trees are all labeled, greenhouses are models of care and culture. Each one given over to some special culture, one for the orchids, another for ferns, near by one for begonias, and bedding plants. The one devoted to Aquatics and tropical plants, was the most artistic public greenhouse that it has ever been my pleasure to visit. No crowding together of specimens, hanging baskets, with trailing vines placed so as to give the best effect. But the discordant note was the carpet bedding, in which elaborate scheme, every shade of red was used, and no amount of luxuriant green could drown the discord.

The Palm garden, or rather the Palm house, in which grew these magnificent palms, reaching to the roof of the great dome, was immaculately clean, and not a bit of soil showing. Every part of the planting surface was covered with a luxuriant growth of the brilliant green Salaginella. With the cascades of running water, the blooming orchids hanging from the roof, the statuary, partially hidden behind some palm, one thought only of the conservatories of the story books.

Horticulturally, one associates Nancy, France, with the name of Lemoine, and the Lilacs, Begonias, Syringas and Gladioli he brought to such perfection. The work is still carried on by the son. Here in Nancy, are also found magnificent specimens of trees, towering testimonials of the work of Stanislaus. The Pepiniere Gardens, or nurseries, make one of the most wonderful parks to be found anywhere in France or Germany. Planted originally by Stanislaus, as an educational nursery, years and years of growth have made it a park with a character all its own. It is to Nancy what the Bois de Bologne is to Paris, but the natural beauties and the trees are far better.

In a horticultural way, one looks to Germany for seeds,

to Holland for Bulbs, to France for Carnations and Chrysanthemums, but it is to Belgium one must go for Orchids, Palms and Bay Trees, Rhododendrons and Azaleas, and for the bulk of hard wooded plants for forcing. The nurseries present much the same appearance as our American nurseries do. Wonderful specimens of orchids were seen, but the manner of protection from theft of cuttings at the establishment of the millionaire grower, was even more interesting than the orchids themselves. We were escorted by wooden-shod employees, hustled through each of the 20 houses at double quick, each house unlocked at entrance and locked immediately as we passed out. Entrance to the grounds was guarded by two immense black dogs, each chained. Imagine such a state of affairs at any of our American establishments, and in justice to other foreign firms, it is a pleasure to say that this one stood alone for such methods. Horticultural militantism might have prevailed at some time in Belgium, to have made such measure necessary.

In strong contrast to this reception, was that given us at the home just across the street, in a quaint Belgium cottage. In the little tea house, near the entrance to this cottage, over which hung the heavily fruited branches of an immense cherry tree, we had Belgian wine, home brewed, and served in real Belgian glasses. Not an hour later, we had old English tea, in the garden of the most modern home imaginable, and the extremes added to the fascination. In one we were miles and miles from home, and in the other, we seemed to have touched American soil. Modern methods of cultivation in the fields prevailed, acres of Azaleas, Bays, and Rhododendrons, being watered by the Skinner system.

In Ghent we were impressed with the modern aspect of everything, and yet a little turn into a side street, and we found ourselves in the quaintest, old-fashioned localities. In Belgium, as in Germany, this admixture of the

INTERIOR, GAR DU SUD, GHENT, BELGIUM

ancient and modern was so noticeable, but, as mentioned before, there was little of old methods in plant or flower culture. Arriving from Paris, at the Gar Sud, in Ghent, one has such a delightfully restful surprise on entering the station. Wonder at the immensity of the station and its up-to-dateness seizes one, but wonder is soon lost in admiration. It is a long walk from the train to the waiting room, but as we enter the court we come upon a most unusual plot of ground, about 200 feet long by 60 feet wide, planted with Palms and Rhododendrons, with beds of plants, all growing above a lawn-like surface. Growing perfectly, too, for light, air and sunshine came through the glass of the roof. The same arrangement might find an ideal setting in our American terminals, but there, stations, train sheds and courts were very neat and clean, for all trains were electrified.

Orchids and lace grow well together in Bruges and we saw ravishing specimens of both. To me, Bruges seemed the most charmingly restful of all places. Its art treasures, its cathedrals, the ancient moats and canals, the dear old lady lacemakers, the quiet elegance of its homes, made a combination found in few small places. Horticulturally, interest centers around the orchids and bay trees as grown at the Sanders establishment, just beyond the city gates. Here one sees bay trees by the mile and orchid houses by the acre. The ladies of our party left Bruges with very sizable boxes of Orchids from these famous houses, and the contents of one box reached America, 14 days later, in fine condition.

Space forbids that I tell of the other good things that came our way, for the treasures of the flowery kingdom were not the only treasures placed before us. At each and every place, host and hostess were mindful of our material needs, and left nothing undone that would add

to our comfort or pleasure.

But as we left Ostend for England, and a few days later, Liverpool for America, tired to exhaustion of "seeing things," and yet filled with wonder and admiration at the progress of things horticultural in foreign countries, we remembered with pride, that it was our own Beecher who said, "flowers were the sweetest things God ever made, and forgot to put a Soul into." And as we felt the sea beneath us, we could have sung with a will, our own Van Dyke's chorus,

Then it's home again and home again, America for me,
In the blessed land of "room enough,"
Beyond the ocean bars
Where the air is full of sunshine,
And the flag is full of stars.

#### GARDENING IN THE MIDDLE WEST.

The eighth annual horticultural show under the auspices of the North Shore Horticultural Society and the Garden Club of Illinois, was held on July 22 at the Durand Art Institute of Lake Forest, Illinois, and was a notable affair in many respects.

Of all the many beautiful North Shore towns of busy Chicago, Lake Forest is the most distinct. Different from all others in the way it is laid out, the streets are more like winding driveways through a huge, beautiful park and located on the steep bluffs of Lake Michigan,

fully 100 feet above it.

More millionaires with large estates are located here than in any other town in the Middle West, and here flourishes a most progressive horticultural society full of live men, among whom E. O. Orpet, as superintendent of "Walden," the Cyrus H. McCormick estate, with a steady force of over 30 men under him, is leading; and at his side are E. Bollinger and John Tiplady. The latter was in charge of this year's splendid show.

There were thousands of Gladioli to greet one on entering the large hall. Among them were the newest and best varieties, but none more admired than the grand novelty Mrs. John Pendleton, Jr., with its large orchid flowering blossoms of delicate pink and deep red blotches in the throat and lower petals; you can't help but fall in

love with this charming sort.

The collection of perennials carrying off the silver medal gave the visiting florists, of which there were quite a number, a better idea of what can be done in this line than a whole year's study of books. Here they were, perfect specimens of each sort desirable for our climate and location.

The good gardener is not the one who knows just all about Roses, how to handle them under glass in factory

style, so as to get the greatest amount of flowers, or the one who recognizes nothing outside of Carnations as True, we have these men, and let us worth growing. give all credit due for getting the most dollars out of what we term as "the business," but don't let us on that account think the less of the man who loves plant life to such an extent as to partly, at least, be unconcerned about the money part, who will tenderly and patiently nurse and care for that Gloxinia, Gesneria or Begonia from the time when the seed is sown until the plants are in full bloom. You will find most of these men among the private gardeners, and the more we specialize as commercial florists, the more we will confine ourselves to the handling of just a few sorts of plants to be grown and the more we will look to the private gardener to be the real gardener.

Compared with the East, the Middle West up to a few years ago could pride itself on but few places where the services of good gardeners were demanded on private estates, or appreciated; but all that has been changed. The present generation wants the best, and is willing to pay for it. Good gardeners from all over have been invited here, and beautiful grounds are the result. exhibition of grand flowers held here last week therefore deserves of more than passing notice. It showed the progress made within eight years in horticulture in outof-door flowers in particular. It proved that a number of earnest and up-to-date men are at work here to produce the best stock possible. They are educating themselves, and a whole host of others along with them, and before long other towns all through the Middle West will get into the same spirit which exists here in Lake Forest, and whether directly or indirectly, the local florists are the ones more benefited financially by these shows than any one else, and therefore it is their duty, and they should be liberal minded enough, to support and encourage the men making these shows possible, or who are connected in any way with them.—Fritz Bahr, in

#### THE MAN WHO WINS.

Florists' Exchange.

The man who wins is the man who works—
The man who toils, while the next man shirks;
The man who stands in his deep distress
With his head held high in the deadly press,
Yes, he is the man who wins.

The man who wins is the man who knows The value of pains and the worth of woes, Who a lesson learns from the man who fails And a moral finds in his mournful wails;

Yes, he is the man who wins.

The man who wins is the man who stays In the unsought paths and the rocky ways; And, perhaps, who lingers now and then, To help some failure to rise again.

Ah! he is the man who wins.

And the man who wins is the man who hears
The curse of the envious in his ears,
But who goes his way with his head held high
And passes the wrecks of the failures by—
For he is the man who wins.

# George W. Vanderbilt, Pioneer in Forestry

By Overton Westfeldt Price.

Our national problem in forestry depends chiefly upon the care given to private forests. The men in the United States who first applied practical forestry to their holdings were in a very real sense public benefactors, for they created those object lessons in the methods and the results of forest conservation which were absolutely essential to its wider application to private forest lands.

First among the pioneers in the practice of forestry on a large scale in America was the late George W. Vanderbilt. It was he who, nearly twenty-five years ago, purchased a great mountain forest tract on the headwaters of the French Broad River and its tributaries in Western North Carolina, and acting under the advice of Gifford Pinchot, then a consulting forester, at once put his forest holdings under conservative management. In those early days it called for a man of much vision and of strong convictions to adopt the practice of forestry. Those were still the days in which forestry was looked upon with indifference by most Americans, and as a chimerical and fantastic theory by not a few. The practical possibilities of forest conservation as a sound business investment for the forest owner had gained little hold on the public mind and it is exceedingly probable that Mr. Vanderbilt acted in the face of the remonstrance of his business advisers, when he set out to demonstrate that forestry can be applied successfully to private lands, with benefit both to the community and to the man who owns them in fee simple.

Two definite and resolute motives actuated Mr. Vanderbilt in adopting forestry and in continuing to practice it unflinchingly on his forest holdings of considerably over one hundred thousand acres, up to the time of his death. The one was the belief, which has been fully justified by the results which he attained, that Western North Carolina with its rich hardwood forests, and its remarkable possibilities for industrial growth, offered an exceptionally favorable opportunity for good returns from timber growing. The other was the conviction that the ownership of forest lands entails certain definite responsibilities to the public; for Mr. Vanderbilt was one of those who held that the private ownership of any resource necessary to the general welfare carries with it the moral obligation of faithful stewardship to the

public.

I recall an occasion a few years ago on which I heard Mr. Vanderbilt, usually a man of much reserve, speak out from the heart his admirable conception of his duty as the owner of Pisgah Forest. The question of the terms on which a pending timber sale should be made, was before him for decision. He faced the alternative of requiring that cutting under this sale should follow the methods of practical forestry, or of waiving all restrictions looking to the protection of the forest. He was reminded that the latter method would naturally be more attractive to prospective purchasers, and that its adoption would probably result in a much higher price being paid for the timber.

"I have stuck to forestry from the beginning," said Mr. Vanderbilt warmly, "and I shall not forsake it now. For me to impair the future usefulness of Pisgah Forest in order to somewhat increase present revenues, would be bad business policy. But apart from that, it would be bad citizenship. As I see it, no man is a good citizen who

destroys for selfish ends a growing forest."

Such was the sincerity and the deep sense of obligation to his fellow men which characterized Mr. Vanderbilt's policy of forest conservation. Pisgah Forest, its mountain slopes clothed in an unbroken mantle of protective tree growth, is his monument. He transformed it by nearly a quarter of a century's efficient fire protection, from a forest characterized by scanty young growth, thin humus covering, and impoverished soil, as the result of injury it had suffered in former years from excessive grazing and recurrent fires, to one whose silvicultural condition is probably unequaled elsewhere in the Southern Appalachians. The forest mould has again accumulated, and a young growth of remarkable density has sprung up under the old trees, and in the rich poplar coves of Pisgah Forest and on its slopes and ridges as well, has taken place with the unbroken years of fire protection, a remarkable restoration to primeval forest conditions.

If a man wants to profit by probably the most forcible object lesson in the results of forest conservation which America contains, he needs only to visit one of the many forest tracts of the Southern Mountains on which nature is struggling against the triple combination of fire, unregulated grazing and destructive lumbering, and then to feast his eyes on the dense and thrifty growth of Pisgah Forest, with its thickets of hardwood saplings, its deep humus layer, and its rare freedom from disease.

But Mr. Vanderbilt did not only preserve the productive capacity of Pisgah Forest. He made it, under a broad and careful plan of development, one of the most easily accessible mountain forests in the United States. In the old days, an excursion into its recesses entailed for its accomplishment an unfailing reserve of enthusiasm, and the vigorous co-operation of a sure-footed mule. For when Mr. Vanderbilt acquired it, Pisgah Forest was a wilderness, and the only means of penetrating it was over a few dim trails occasionally used by the mountaineers, who dug, "sang," grazed cattle, hunted, fished, and possibly "stilled" now and then within its boundaries. Today good roads run up each of the larger valleys, and a network of well graded trails leads from them to all parts of the property. The aggregate length of the roads and trails probably exceeds 200 miles.

The crowning achievement of Mr. Vanderbilt's vigorous policy for giving Pisgah Forest so complete a system of transportation as to make it practically a park, was the construction of sixteen miles of automobile road, which make it possible to reach the heart of the tract in a couple of hours from Asheville, and to enjoy a superb panorama of mountain scenery on the way. At its highest point this road reaches an altitude of five thousand

two hundred feet.

Biltmore Forest, the second large division of Mr. Vanderbilt's forest holdings, lies on both sides of the French Broad River near Asheville. As the result of its accessibility, it suffered far more severely from destructive logging than did Pisgah Forest at the hands of its former owners, most of them small farmers, who found a ready market in Asheville for firewood, and for saw logs at local mills. Cutting had been done with an eye single to immediate returns and wholly without regard for the safety of the forest, and fires had been permitted to burn unchecked. There had been much injudicious clearing of steep upper slopes, which, after a few years of unprofitable cultivation, were generally abandoned to erosion, which in the loose soil and exceptionally heavy railfall of the region occurs with remarkable rapidity. But here again forest conservation for nearly a quarter of a century has worked a wonderful change. Stock have been wholly excluded from the forest, careful improvement cuttings aimed primarily at the betterment of its silvicultural condition have been carried forward, and cleared lands unfit for agriculture on account of steepness and thin soil have been planted to trees. Biltmore Forest is today full stocked with a thrifty stand, and producing a steady and increasing yield of firewood and small timbers. The forest plantations set out on denuded lands, which cover in the aggregate about four thousand acres, are among the most successful in America; and Mr. Vanderbilt had the well-earned gratification of seeing harvested as the product of careful thinnings, logs suitable for box boards, grown from seedlings planted as the result of his forethought over twenty years ago.

I do not want to close this brief account of the first great object lesson in forest conservation in the United States on private lands without a reference to the personality of the man who created and enriched it with each year of his faithful stewardship. Mr. Vanderbilt possessed singular gentleness and nobility of spirit, and had an intense and abiding love for the world out-ofdoors. As his life lengthened, he was drawn more and more to long sojourns at Buck Springs Lodge, a log structure within a mile of the top of Mount Pisgah, and probably no scene was so dear to his heart as the view from the lodge of the green gorge of Big Creek, winding down among a jumble of mountains to the wide valley of the French Broad with the outlines of the Blue Ridge beyond. During the last years of his life more and more of his pleasure was gained from landscape architecture, of which he was a faithful student and for which he possessed rare power. He laid out in the vicinity of the lodge trails carefully designed to reveal exquisite glimpses of the mountains, and these he developed still further by skillful cuttings which he termed appropriately "Painting with the axe." It was a wholesome sight to see this man of great possessions supervising the development of vista cuttings for the disclosure of some view whose latent possibilities his skilled eye alone had detected, and it was characteristic of him, to judge no such achievement complete until it had contributed to the enjoyment of his friends.

The range of Mr. Vanderbilt's charities in the mountain community which owes so much to him, he scrupulously withheld from common knowledge. But the largest of his many contributions to the general welfare hes in the great and wholesome lesson taught by the activities of his vast estate. For not only did he demonstrate the methods and the practical advantages of forestry for private owners; he was also a pioneer in scientific agriculture, in horticulture and in model dairying. The stimulus afforded by his example towards improved agricultural methods in the South is beyond all estimate.

George W. Vanderbilt earned, and no doubt he will receive, a high place in permanent public recognition of his distinguished public service. Were his admirable conception of the moral responsibility which accompanies the private ownership of natural resources the rule instead of the exception, the conservation problem in America would be already solved.—American Forestry.

# NAMING AN AUTOMOBILE.

A prominent motor car manufacturer in the midlands had the idea of naming his cars after flowers. Said he to a friend:

"I think of calling that new car over there," pointing to a huge red limousine, "the Crimson Rambler."

But his friend who had been out in the indicated car, replied, kindly:

"Why not call it the Virginia Creeper?"

### LICHENS AND THEIR VALUE.

You have seen, on rocks and trees in wild places, certain flat, papery or leathery objects of various colors, that resembled you hardly knew what, unless you are a botanist. You have probably seen them too on soil, and so loosely attached as to become separated at the lightest touch, while some on the rocks, apparently hardly more than spots of color, seem almost imbedded; and on old houses and fences and in exposed situations generally at all seasons. These blotches are living, growing plants. They are lichens. Most fascinating plants they are too, because of their wide range and peculiar mode of life.

Sometimes rocks or large boulders are so covered with various kinds that they present a curiously mottled, often an encrusted appearance.

I remember hearing the driver of a stage coach say, as he pointed to a well-known lichen hanging in festoons from the branches of a tree, "Yes, sir, that stuff up in those oaks will show you how high this river rises sometimes."

How much more interesting many a drive would be, if we knew a little more of the world about us.

Lichens are world-wide in their distribution. In the extreme north they form the most advanced outpost of vegetable life. They are found on mountain tops far in advance of other vegetation, and they abound in the hottest countries. They are the pioneers of the vegetable world, subsisting largely on what the wind and the rain can bring them.

They are most frequently seen on the weather side of rocks, trees, fences and old houses. This fact has been utilized by explorers and trappers to guide them through unfamiliar places. One kind grows on the leaf of the coffee plant, and one found in California grows on the boxwood leaf. Both probably derive some nourishment from the green part of the plant, and are therefore to some extent probably parasitic. A few are marine, occurring on rocks and rocky ledges that are submerged at high tide.

They seem to disappear before the advance of civilization, and are comparatively rare in parks, near dwellings and along much traveled roadsides. Some authorities say they are sensitive to noxious gases, smoke and dust. They are little affected by drought or changes in temperature. During dry weather or dry seasons they lie dormant, but with the first rainfall they change from brittleness to elasticity, and the colors brighten.

As distinguished from the mosses, to which they are not related, they lack leaves and the characteristic green coloring. They are lower in the scale of plant evolution than the mosses.

A lichen is not a single plant unit as is the oak or the fern, but a composite organism made up of an alga and a fungus. The kinds of algae vary in the different lichens. Most of them, however, are the simplest forms, known as the single-celled algae. Most of the fungi belong to the group known as sac-fungi, because they form their spores in little sac-like structures. The fungi are dependent upon the algae for their organic food, and the algae are protected by the fungi against loss of moisture, and supply to them certain necessary chemicals—a life retionship for mutual benefit; one supplies what the other lacks, making it possible for two organisms to thrive where neither could exist alone. As a result of this partnership, the lichens are wonderfully successful in the struggle for existence.

We must not confuse this mutualistic relationship with parasitism. In that there is also an intimate biological relationship, but one organism (the host) is injuriously affected, while the other (the guest) is benefited. The host plant always thrives better without the parasite, as

in the case of the oak and the mistletoe.

These plants exist in three general types or forms, fruticose, foliose and crustose. The fruticose are more or less branched and filamentous. The widely distributed beard moss (Usnea bankata) on trees, on oaks especially and less commonly on posts and fences, is typically fruticose. The foliose (leaf-like) are thin, papery and flat, and are rather loosely attached to the bark. They are also found on rocks and fences. Iceland moss obtainable in drug stores is an example. The crustose appear to be mere discolorations.

Lichens are indefinitely perennial. It is probable that most of these on large mountain rocks, or on aged trees, are hundreds of years old. In the reindeer moss of the tundra there is a continuous growth at the top, while the

basal portions are as constantly dying.

The growth of many is extremely slow, some taking years to arrive at the spore bearing stage. One variety has been known to grow for forty-five years before pro-

ducing the spore bearing structures.

Any bit of lichen will develop into a new plant provided the part includes both partners. In fact a lichen dried so thoroughly that it may be powdered, will renew its activity as an indefinite number of plants, if the powder is scattered in a suitable place and kept moist. Furthermore there are special propagative organs called seredia, minute bodies composed of both alga and fungus and usually formed along the edges of the thallus. To the naked eye these clusters appear as slightly raised specks, or as a white fringe. The individual soredia composing these clusters are too small to be seen by the naked eve. Other propagative structures are the apothecia, small cupshaped or dome-shaped growths about a quarter of an inch in diameter, and generally slightly raised, occurring on the surface in the foliose forms, and on the ends of the branches in the fruticose. In the lichen known as red cup moss, the bright red spots are the apothecia. These tiny cups belong to the fungal portion.

The following are a few of the more interesting species with a brief reference to their real or supposed economic

value.

No lichen has been of greater industrial value than dver's moss or dver's fungus, which vields a dve known as orchil, cudbear or litmus. Orchil proper, a rich purple dve, is obtained from Rocella tinctoria, a species common in the Mediterranean countries, Western Mexico, Central America and in warm countries generally. The blue and the purple of the Old Testament (Ezekiel XXXII, 7) is supposed to refer to the dve obtained from this plant. It was also used by the Greeks and Romans, and was an important article of commerce. Other lichens yield various dyes. Cudbear, from Lecanora, is much used by the peasantry of Northern Europe for dying woolen cloth scarlet or purple. Many species yielding red, brown, purple and vellow dves have been, and probably still are used as domestic dyes by the natives of the regions in which they are found. The coloring matter is in the acids contained in the plants, but little is definitely known of their chemistry. Another interesting form is the beard moss found chiefly on oaks. It hangs in beard-like tufts from the branches, and varies in length from several inches to several feet. It serves as food for certain wild animals, and also sometimes for domestic animals. During the early middle ages this "moss" was much used as a remedy for insanity, epilepsy and other nervous disorders, but to be efficacious it should be gathered from the skull of a criminal that had I een left hanging on the free.

Reindeer moss (Cladonia rangiferina) is the chief food

of the reindeer. Even the Laplander in time of need does not disdain to prepare it for his own meal. Of all the lichens this is doubtless the most useful. In winter the animals scrape away the snow, and feed upon this growth.

In recent years, in Scandinavia and Russia, alcohol has been distilled from reindeer moss. Formerly another lichen, Sticta pulmonaria (lungwort), was much used instead of hops in brewing. A certain Siberian monastery was celebrated for beer that owed its flavor to this lichen. A small greyish or nearly white lichen, known to botanists as Lecanora esculenta, and called in Western Asia "earthbread," is believed by some to have been the manna of the Israelites. In times of drouth and famine, it has served as food for man and beast on the arid plains of Northern Africa, Eastern Europe and Western Asia. It grows unattached or very lightly attached to the ground in the form of irregular lumps, sometimes six or seven inches thick.

Iceland moss is still highly prized as an article of diet, especially by convalescents. The Swedish peasantry make a bread of it and it often forms the chief food of the poor Icelander. A lichen commonly known as "rock tripe" (Umbilicaria) has been used as food by hunters and trappers of the far North where these plants are abundant on rocky ledges. It is stated that the members of the Franklin polar expedition subsisted on this lichen for some time.

Peltigera canina formed the basis of a one-time celebrated cure for hydrophobia. Ramalina reticulata is another attractive lichen, known as "old man," "old man's beard" and sometimes "beard moss,". It differs from the true beard moss with which it is often confused. The thallus branches are flattened while those of the true beard moss are cylindrical. It is abundant on oaks along the California coast. "Old man" is used for packing material, bedding for cattle and as fodder.

Lichens by an eminent botanist of long ago were called "the beggarly among plants." Like the poor they are always with us. The number of different kinds sometimes found on a single boulder are surprising, as are the variety and number on fence rails and trees along the roadside. The representative species may be easily identified by the help of special books on the subject.

To one fond of collecting they will prove a joy, as no special drying apparatus is immediately necessary. At one's convenience they may be moistened, spread on drying sheets and mounted in the usual manner. It is well to remember that the lichen, like everything else, is most beautiful in its natural setting. If you do not need it for real and detailed study, let it remain where it grows. Too many plants find their way into the amateur collector's box. A real lover of nature is loathe to destroy or to take from its home any living growing thing. Far more important than the classification of any plant, is an appreciation of its beauty and fitness in the general scheme of creation.—The Guide to Nature.

# WRINKLES IN HORTICULTURAL WRITINGS.

It is one thing to write a book to suit oneself, and another to write one which shall be beyond criticism. The horticulturist generally is beyond the pale of criticism as far as a description of his practice goes, but when he launches into word pictures he does not seem to know where to "fetch up." A certain Rev. E. A. Bowles, who has achieved more or less prominence as a horticultural writer, recently published a book entitled "My Garden in Spring."

This book is about Mr. Bowles' garden, but it sets us asking questions about the mind of man, and in particular the question why men find it so difficult to write

books. Most of them can talk easily enough, and when they have anything to say can say it without any contortions of speech; but the moment they begin to write, their speech is apt to contort itself like the legs of a Victorian sideboard.

What is it that makes Mr. Bowles call someone's garden "a veritable golconda of floral treasures"?

Why is it that he begins a chapter on spring Crocuses thus?—

"For me, starting this chapter, there are great searchings of heart, compared with which those of the divisions of Reuben were nothing. If but one of them possessed a flat object with diverse and recognizable sides to it they might toss up and decide whether to go and help smash up Sisera or stay and listen to the music of their baa-lambs, and they seem to have decided pretty unanimously for the ovine concert. But for me, the very inmost cockle of whose heart glows more for a Crocus than for the most expensive Orchid, every cockle in me (though I haven't a notion what portion of my internal anatomy is meant by that borrowed appellation of marine molluses) is full of searchings and provisions how to do justice to my first garden love and avoid wearying and driving away readers to whom my raptures may appear the vaporings of a love-sick monomaniac."

Mr. Bowles, we are sure, would never talk like that; why does he take the trouble to write so? Why is writing for him a kind of obstacle race with every possible irrelevance interposed between him and his subject

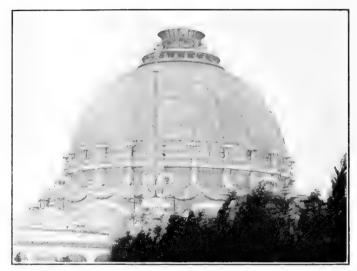

matter!

It is the same with Mr. Farrer, who tells us in his preface that "There was once a man who stood upon mont Cenis when all the earth was indeed a burning deck of blossom, filmed into the uttermost distances with gold and violet veins of the Pansies." This man, we are told, said "I don't think much of this for a display," which was a bad judgment on the Mont Cenis, but not so bad on Mr. Farrer's eloquence. For that tells us much more about his notions of style than about the beauties of the Mont Cenis. As we read it, instead of seeing these beauties with the mind's eye, we are set to wondering how the Pansies managed to film the earth into its uttermost distances with their purple and gold veins, or rather by what mental processes Mr. Farrer managed to persuade himself that his ideas were expressed by his language. We have no doubt that both he and Mr. Bowles are eager to tell us all kinds of interesting things that they know, but when they write, they are like bad swimmers who kick and splash and make no progress. And yet writing, for those who have something to say and are content to say that and nothing more, is not much more difficult than talking.

Mr. Bowles has a great deal to say. He could, if he would, tell us how to grow a great many plants; but, instead of doing that, he will try to express his feelings about his garden; and it is when a writer tries to express his feelings that all the difficulties of literature begin with him. We listen to a good gardener with respect when he expounds his craft; but the best gardener in the world is not therefore a humorist or a poet, and it is a fact which the writers of books on gardening continually forget. They try to communicate emotion to those who seek information. They labor to tell us what they feel when we want to know what they do. Mr. Bowles' book is of some value because, out of his great experience, he tells us which are the best out of many different species and varieties of plants; but how much more valuable it might have been if he could have remembered that Reuben and Sisera and marine molluscs have nothing to do with spring Crocuses.—Florist Trade Journal.

### LARGEST GLASS DOME IN THE WORLD.

An idea of the splendor and beauty of the Panama-Pacific International Exposition which is to open at San Francisco next year is given in this photograph of the hugh glass dome of the Palace of Horticulture. This is the largest glass dome in existence, being 185 feet in height and 152 feet in diameter. It is comprised of a steel frame with a wire glass covering. The architecture of the Palace of Horticulture, which is 600 feet long by 300 feet wide, is of Saracenic origin, resembling the famous mosque of the Sultan Ahmed I. The dome is visible miles from the exposition grounds. At night it will be illuminated by giant searchlights playing on the glass from within.

GLASS DOME ON HORTICULTURAL BUILDING, SAN FRANCISCO EXPOSITION.

# JUST GLIMPSES—"SISTERS."

By Miriam Teichner.

I paid a visit to the room of one
Hospital patient, "just a little" ill.
A woman who, since living had begun,
Had all the world to answer to her will.
And now, the social season lacking zest,
Quiet required, and nurse's care, "for rest."

The room was golden with the summer light.

Massed groups of flowers nodded toward the bed;
Great roses white and red and jonquils bright,
And violets, purple-sweet. The patient said,
In fretful tone: "Nurse, all this thick perfume
Annoys me. Take the flowers from the room."

In passing out, into a ward I strayed.

Here, narrow beds, each with its pain-racked form,
And here a stifled moan, and here one prayed

For quick release. Like mutt'ring of a storm
Hung on the air the pregnant chance of death,
So near, one almost feared to draw the breath.

I dropped the rose I held beside the cheek
Of one, a woman fever-painted, dazed
With pain; so famine-thin, so weak, so weak!
The vacant, staring eyes in stupor gazed.
She seized the bud, as eager as a child,
And kissed its coolness with hot lips that smiled.

Editor Gardeners' Chronicie;

Will you allow me the use of a portion of your space to offer a few words or comment upon some of the statements of Mr.

Frederick Liston in your last issue.

It appears to me that Mr. Liston must have been singularly unfortunate in his experiences, but if he has had to live in an unsanitary damp old shack, infested with vermin, etc., etc., himself that does not seem to be a sufficient reason for saying that these and other conditions he mentions "are prevalent in this country." Certainly I have yet to learn that "a large number of employers merely monkey with competent men" because a really competent man would not take a position without knowing something about it beforehand.

The state of things mentioned by Mr. Liston were never paralleled in the South before the Civil War, and I must admit that I find it difficult to believe any estate owner would ask a colored.

much less a white, man to live under such,

My experience in this country has been fairly wide, both in connection with employers for whom I have worked and hundreds of others in all parts of the country who have come under my observation, and I have never known one case where the gardener did not have at least comfortable quarters, some, of course, with more modern improvements than others.

If the conditions enumerated by your correspondent exist anywhere in this country then it is entirely the fault of those who work under them. Any man with an ounce of work or spunk in him would do something else rather than live like that. There are plenty of jobs going on farms where man can get good quarters, good food and pay which is worth having in addition.

Failing better a man could do worse.

As regards conditions in Great Britain, it is true that a good deal of land has gone out of cultivation (as it has in the Eastern States here), but not for the reasons stated. It has been caused more by the difficulty in getting labor than anything else, and there has been no "influx of farm hands to invade the ranks of gardeners." The employment market as a whole is not more congested than here, and there are not half the number of unemployed in London as there are in New York. The fact is that a number of men come to this country with the idea that it is an El Dorado, and that it is easy to get a soft job with good pay and little work; when they find themselves mistaken they blame the country instead of themselves. The difference in pay between the two countries is only about enough to compensate for the difference in the cost of living. The highest paid head gardeners in England receive a larger amount than do the highest paid ones here, and the former frequently supplement their incomes by the premiums they receive from young man who wish to learn their profession under them.

Up to a recent date any man from the old country calling himself a gardener, who had some smattering of the profession. could easily get a job here who would not be looked at at home, as there the standard of competency is very much higher than here because employers there are mostly experts themselves, and this latter fact is another reason which would prevent any influx of cheap farm labor having any effect upon the real gardeners'

The statement that a gardener's wife's services as cook, etc., are very often included in a \$50 salary appears on the face of it to be incomplete, for in that case board for both as well as accommodation would necessarily be included, and the salary would in that case be nearly all profit.

The political and plutocratic oppression mentioned as existing in England must be merely a figment of Mr. Liston's imagina-

tion because they do not exist there.

I must not trespass further upon your space, and will conclude by expressing the hope that Mr. Liston has by this time obtained a position under more favorable conditions and can therefore take a more optimistic view of the situation.

ARTHUR SMITH.

Editor Gardeners' Chronicle:

Having read the articles on pages 86 and 87, July issue of The Gardeners' Chronicle, headed "Gardeners' Grievances," by Frederick Listor, there is one point in the second letter that I have had in my mind some time past.

In my opinion, it would be a benefit to the gardener to have an advertising column for positions wanted. Not exactly free, but at a minimum rate to cover expenses of same. I think it would be well circulated and give the gardeners more chance of securing suitable positions

Hoping you will give this your consideration. BRONXITE.

### From "Horticulture."

In reading the essay on "The Reason for Cheap Gardoners." written by an assistant, one can't help but realize that the author seems to think that even after fifteen years' experience an assistant isn't necessarily competent. Would that man ever be competent? We realize that in all branches of work there are men who never prove themselves a credit to their avocation. Where is the man who has spent a lifetime at gardening that can sit back and say I know it all? There is the monotony that dulls and deadens, and to start something is the only relief.

Surely after serving a lifteen years' apprenticeship an assistant must be worthy enough to strike out for himself. to test the matter is to make a beginning; to start. An extract from Stevenson that may fire our worthy friend with a little more ambition is this: "For God's sake give me the young man with brains enough to make a fool of himself." He wanted to see in the world young men with brains enough to start something, to make an essay of their powers. Most of our great men have made false starts and have been derided for their pains, but in every case they have had sense enough to see their mistakes and profit by them. Rather than blame the assistants for the existing conditions why not look the matter straight in the face and lay the blame in its proper quarters namely, your competent gardeners and your so-called horticultural societies?

We hear men shout, "have the interest of your profession heart." They seem to lose sight of the fact that for an emat heart." ployer to have the interest of anything at heart, he must also have the interest of his employees somewhere in that neighborhood. Who but your discredited assistant is to carry on the work of your competent gardeners of the present day after they have added their little page to history? For some of our so-For some of our socalled horticultural societies a more fitting name would be a monthly smoker. On visiting a few of them the fact is forced upon one that they are little more than a mere meeting place for the exchange of the latest stories, and the same are not always pertaining to gardening. On most occasions there are a 'ew exhibits. Mr. So and So is awarded a culture certificate for such a plant. On being asked to tell the members what he has done to raise the plant to that stage of perfection, he will give you a heart-breaker like this: "Oh, I don't know that I have given it any special treatment, watered when it needed it, gave it a bit of fertilizer now and again, etc." A lot of encouragement to the assistant who has been looking after that plant with all the care and attention he possessed very often in his own time, with the hope of getting something worth looking at. If your present day gardeners have gained success in this slip-shod manner what is to hinder the assistant from accomplishing the same ends? Arnold Bennett spoke wisely when he said "You cannot gain anything by merely thinking about it, for after the necessary period of consideration, of incubation, as it were, a start must be made."

ANOTHER ASSISTANT.

### From "Horticulture."

Summed up, the contention of "Another Assistant," in your issue of July 18, is that after fifteen years' experience a gardener should be qualified to assume the full responsibilities of his profession. Few will disagree with him on that point, and I believe that "An Assistant" who wrote in the previous issue will concur that if a man has had the opportunity of fifteen years of thorough training and is then incompetent, his competency as a gardener is never likely to prove of much. I infer from "An Assistant's" remarks that he had in mind a class of so-called assistants which exists within the profession, just as does the class of so-called gardeners, and that his grievance is directed against this class and not towards assistants that possess the ability that is manifested by the contributors in the arguments they present.

Assistants are no more to blame for the existing unfavorable condition than these gardeners who profess to be competent but who are no more so than the assistants who menace the profession by seeking to assume the charge of an establishment with no more knowledge of gardening than what was acquired through two or three years' service in greenhouses, and who will bid for a head gardener's position at a salary so low that no able gardener can compete; and whose action invariably results in another score against the profession by some inconsiderate estate owner who knows so little about horticulture himself that he cannot distinguish between a competent and an incompetent gar-

dener when it comes to selecting one.

This is the age of young men, and opportunity awaits the assistants who are thoroughly proficient in their profession, which must include executive ability as well as ability to produce; and such young men should not permit themselves to be held in the background, for if they do how is the good in them to be uncovered? We have an illustration right at hand in your two correspondents. Their articles have elicited favorable comment, but they conceal their identiay behind nom-de-plumes. Able men are continuously sought, and there is no teling what their signa-

tures, disclosing the authors, might have brought to them.
What "Another Assistant" states regarding the horticultural societies is unfortunately true to a considerable extent; but there is a growing tendency to make the meetings of local societies

more educational, and many of them now manage to have an essay or lecture at each meeting. Assistants are also being recognized: for one of these societies has inaugurated a plan to award a prize for exhibits made at each monthly meeting by assistant gardeners, and this is likely to be followed by other societies as the practice comes to their notice. The co-operative movement between various societies will bring about more serious consideration of the problems which confront the profession of gardening than has heretofore been given to them.

As an answer to the question, "If your present day gardener

has gained success in this slip-shod manner, what is to hinder the assistant from accomplishing the same end?"-let it be said that the day of the "rule of thumb" methods is a thing of the past. Efficiency now counts with those engaged in gardening just as it does with those engaged in any other vocation. If it has accomplished nothing more, the recent controversy on the gardeners' problems has been fruitful in stirring up discussion among those most vitally interested—the gardeners themselves. We should have more of it, and "Horticulture" is to be commended for the M. C. EBEL, Secretary, space it is giving up to it.

National Association of Gardeners.

### Editor Gardeners' Chronicle:

I feel disposed to say a few words in regard to the writings of various gardeners in the Chronicle and Horticulture. Mr. Liston evidently has met with a streak of hard luck, because when he compares conditions prevailing in England and America, his opinion is in favor of the former.

Now, as one who has had experience in England, Scotland, Wales, Canada and America, I cannot refrain from contributing my mite of thought and experience. When he says that in comparison wages here are nil compared with the old world, makes me think he is homesick or has not seen much of either countries.

Now, to compare both England and America. A journeyman receives from 12 to 18 shillings per week, both milk and vegetables. a total value of about \$5. What is that in comparison to our assistant of \$40 per month and board, or in English money £8 clear. He has had to pay a large premium to learn gardening in some important field of horticulture.

He has to work from 6 a. m. until 5:30 p. m., with half hour deducted for breakfast and an hour for dinner, and must work very hard and not think he is a necessary part of the establishment. In many places he has to work in fruit houses until dark. In my early days we used to rise at 4 a. m. in summer to thin Very rarely are any paid for overtime, but allowed 10 days vacation. If he wants to attain a head gardener's position, he has to serve as foreman in a noted place until he is over 30 years of age, being generally considered capable then, but it is generally useless to try for a head place previous to this.

He also attends science and art classes and is generally a fairly well educated journeyman. If he is successful in his desire he must get married, not to suit himself or his partner, but his boss. His wages are about £2 a week, with house, coal, milk, vegetables and requisites, worth altogether in American money about \$15 a week. Compare this with what many head gardeners are receiving in America. There are a few getting more in England, but I have tried to give an average of the best paid places. for many good men are receiving less.

He must attend the village church and associate himself with whatever political side his employer is on. He is not usually kept if his family amounts to more than two children, and at the same time his boss will go on a public platform and preach against "Race Suicide! ' and advise his tenants not to emigrate.

His family must dress neatly but not in any way to approach his boss' kids. I knew a countess in the Midlands who met her head gardener's two small girls going to Sunday school and they were nicely clothed. Her ladyship stopped them and asked whose children they were. They replied, Mr. Jones' children, my lady. Her retort was, that they were better clothed than her own, and the head gardener was dismissed. Now, this is a fact, I know of it personally. This could never happen in America. do as we choose.

Mr. Liston says a gardener is a necessity because he is a producer. I take issue with that. What a gardener produces are not necessities, but luxuriant flowers, fruits, etc. To be a necessary producer the product would have to pay for all expenses connected therewith, and no private gardener makes a place pay.

We cannot make a corner of our labor like the plumber, mason, or any mechanic. We can only do our best to please our employers, and if conditions do not suit us we must suit ourselves to the conditions, because we are unnecessary.

What then, we say, are the benefits to accrue from the N. A. G. and of what lasting benefit is to be derived from it? We all know it cannot act as a salve for the wounded feelings of gardener or employer.

Sometimes it seems to give prominence to some head gardeners who are more fortunate than the average in having a boss who

allows them the strings of his purse and where expense does not count in the least.

We read about men who are leaders in horticulture, and smile at the idea. It is easy to get a great name in America. is one of the privileges. But looking around the places of some of these so-called leaders sometimes, we-fail to see where they shine. Because a man is a large exhibitor does not say he is a successful gardener. Many excellent men are working as assis an s and making a great name for the man for whom they serve, an l without their assistance the head man would be helpless on many occasions. Now, what the N. A. G. can do, I think, is to protect those who are in the profession as assistants, and try to keep out those who are continually imported as head men.

This is one of the perils to face. I am aware that a man who points out faults and perils is as unpopular as the minister who speaks the truth to his flock each Sunday. Most societies are formed to protect the worker. Now, why does not the N. A. G. protect the gardener? is the cry of many, silently, but who have not the courage to express their views in writing. But various reasons compel many to maintain silence.

A gardeners association in which members are divided cannot

Mr. Liston speaks, I believe, about the benefits in England derived from the British Gardeners' Association. We are much better situated here. We also have in our worthy secretary a man who is very much alive and who is doing more for the gardener than any one in the world, and it is our duty to help him.

Trusting you will give this space in the Chronicle.

### MASSACHUSETTS HORTICULTURAL SOCIETY EXHIBITION. AUGUST 8 AND 9, 1914.

The exhibition in Horticultural Hall on August 8 and 9 was a truly magnificent one, and it is many years since Boston had so beautiful, varied and extensive a summer show. Of the many striking features the most noteworthy was that of James Marlborough, superintendent to Thomas E. Proctor, Topsfield, Mass. Mr. Marlborough has made many fine displays in the past, but his exhibit on this occasion of hundreds of colored caladiums in over 125 varieties, filling one-third of the main exhibition hall, was wonderful. He arranged his plants in beds to produce a garden-like effect. The pond of water within the central bed with a fountain playing made the exhibit very refreshing on a warm August day. A gold medal was awarded to Mr. Marlborough; also a silver medal for superior culture.

Gladioli were shown in great numbers and of fine quality. The leading exhibitors of these were: William Sim, Chamberlain & Gage, B. Hammond Tracy, John Lewis Childs and William Whit-The variety Myrtle won first prize for Chamberlain & Gage for the best hamper or basket. Child's new Whitest White received honorable mention.

The show of hardy perennials was a magnificent one. R. & J. Farquhar & Company had an immense display all set up, so had Eastern Nurseries, Bay State Nurseries, Frederick H. Rea. William Page and Mount Desert Nurseries.

E. F. Duve & Son had a fine collection of dahlias. P. J. Rooney was awarded a certificate of merit for peony flowered dahlia, Mrs. Fred Grinnell. William Nicholson had vases of the newer forms of Buddleia variabilis. A. M. Davenport had massive flower heads of heliotropes. H. Stewart, gardener to Miss C. Warren, showed a fine lot of greenhouse and outdoor cut flowers.

In the competitive classes F. J. Rea, T. C. Tharlow's Sons, M. Sullivan, gardener to William Whitman and Eastern Nurseries, secured the prizes for perennial phlox classes. For gladioli William Sim, Chamberlain & Gage and Geo. Page, gardener to Mrs. Frederick Ayer, were winners, and Martin Sullivan swept the deck in the aster classes. For one hundred vases of annuals, not less than thirty species, William Thatcher, gardener to Mrs. J. L. Gardner; George Melvin, gardener to Col. Charles Pfaff, and Martin Sullivan won in the order named.

There were splendid displays of fruits and vegetables. A cultural certificate was awarded to William Downs, gardener to E. S. Webster, for splendid Lord Napier nectarines. A certificate of merit was also awarded to the estate of W. C. Jennison for the finest cultivated blueberries I have ever seen, the fruit being nearly as large as cherries. For fifteen varieties of vegetables arranged for effect, Edward Parker, gardener to Oliver Ames, was first and E. L. Lewis, gardener to Col. Frederick Mason, second.

It was a thousand pities that this fine exhibition could not have been arranged for convention week, as it would have proved vastly more interesting from a horticultural standpoint than the stereotyped so-called "trade exhibitions" given by the S. A. F. W. N. CRAIG.

# QUERIES and ANSWERS

We believe the greatest good can be accomplished for the greatest

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.

Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

Nothing will tend to better followship that the contribution of the property of the property of the contribution of the contribu

Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

Can you furnish me with directions as to the methods employed for raising perennial and other plants from seed in the open air? What is the usual size of the seed bed; how is it prepared; what is the usual distance between rows; the most convenient length for the row; the manner of identifying the varieties; the size of the label if one is used, and any other helpful information that may occur to you in this connection? As perennial seeds are often slow in germinating what is done to control the weeds between and in the rows to reduce to a minimum the injury to seedling plants and dormant seeds wished to be retained?—C. H. P.

The usual methods employed by large nurserymen in seed raising outdoors is in beds running east and west for perennial seeds; in order to give them the greatest amount of sunshine when germinated.

The soil must be deeply dug, but not necessarily rich. In fact, no animal manures should be present for seed sowing of flowering plants.

A convenient length is 100 feet. Mark out beds 6 feet wide. Leave 6 inches each side, and it will leave a space of 1 foot for 5 rows in each bed.

Run a line along, and mark out a drill, not deep, one inch is sufficient, in fact, too much, and too much care cannot be exercised in this matter. The soil should be in a fairly dry condition at time of sowing. August is the best month for the operation; and after scattering seed fairly thick in the drill cover slightly with fine soil which has been screened through a 1/16-inch screen, tamp down gently with the back of a spade, sufficient to press the seed in contact with the soil. In about 10 days some of the seeds will be through and unless the weather is very dry no water is required, but do not allow to suffer when germinated but water gently with a fine nose on the

The rows should be marked at each end by a plant stake 1 foot long. A convenient label is the kind florists all supply, which are soaked in a chemical and are better and more permanent than the ordinary painted ones. A label 8 inches is a useful one for outdoor purposes.

The above methods will do for annuals for perennial and biennial flower seeds; also for Perennial Shrubs. They must be cultivated between rows by hand, and the Dutch Hoe. Experience is the only way of knowing the varieties as they break through the soil.

As soon as convenient to handle, the young plants must be transferred to other beds composed similar to the seed bed, but must be protected from the hot sunshine. An excellent shade is made with plaster laths, in the form of a trellis and these can be obtained from any florist's store by mentioning the size required.

Pansy seed germinates better in a dark frame, and if a few stout stakes are driven in and a sash placed over and shaded a few days, it will hasten the germination.

It is an easily accomplished matter to raise thousands of young plants from seed. Care being necessary; also buy the seed from a reliable source. Weeds must be picked by hand from among the slow-growing plants.

### LENOX HORTICULTURAL SOCIETY.

Excelling any previous exhibition in perennials and annuals, and the largest and most diversified showing of flowers and vegetables, the annual flower show of the Lenox Horticultural Society which opened ferior exhibits or on entries not made ac in the Town Hall at Lenox, Mass., July 23, cording to schedule rule. was conceded to be the most successful in every way in the history of the organiza- 11 o'clock on Thursday, the first day of the tion. Nothing so brilliant as the colorings exhibition, when indging will begin. of the flowers on display was ever shown before in Lenox.

An exhibit of 24 varieties of Sweet Peas was considered the premier display of the The leading competitors in this class were Mrs. Girand Foster of Bellefountaine Gardens and Mrs. William B. O. Field of Highlawn Gardens. Both exhibitors showed

new varieties, Mrs. Field having a cerise Spencer and a Marks Fey, a blue, while Mrs. Foster's double cream Floradell Fairy and a new cerise Illuminator, were splendid specimens.

One of the new flowers shown in Lenox for the first time was Begonia Alice Manning, Mrs. Carlos De Heredia exhibiting six

pots of this plant.

Miss Katherine L. Lawrence won the competition for the arrangement of out-ofdoor flowers and foliage in a centerpiece for table decorations, consisting of a 24-inch basket containing an oval arrangement of Lady Grizel Hamilton Sweet Peas set off with foliage of gypsophila (baby's breath), the dainty white contrasting perfectly with the deep lavender of the flower.

William E. S. Griswold showed a new variety of penstemon, which was greatly admired. Others exhibiting in this class were Mrs. Carlos De Heredia and Mrs. Robert Winthrop. In the class for delphini-ums, Arthur N. Cooley, of Pittsfield, had a very light blue flower. This was a long class, with the largest growers showing the blue flower in much profusion.

Mrs. Carlos De Heredia showed a fine collection of perennials, as did Mrs. John E. Alexandre and Joseph H. Choate. Smaller collections were exhibited by Mrs. William Hall Walker, of Great Barrington, Arthur N. Cooley, of Pittsfield, and Mrs. William E. S. Griswold.

Mrs. John E. Alexandre had a big showing of Asters, her Asters being quite the best that were shown. Charles Lanier made a big display of out-of-door Roses, as did Miss Adele Kneeland.

The judges were Walter Angus, superintendent of Mrs. Herbert Schoville's country place at Chapinville, Conn.: R. H. Schmidt, superintendent of Mrs. George Griswold Haven's country place, and John A. Donahue, superintendent of Belvoir Terrace, the country place of the late Morris K. Jessup.

### TARRYTOWN HORTICULTURAL SOCIETY.

The annual outing of the Tarrytown Horticultural Society took place at Rye Beach, Rye, N. Y., August 4. Dinner was served at Edwards' Hotel. Seventy-five members and friends of the society were present, and all enjoyed the dinner and the day's outing. The committee in charge,-James W. Smith, William Scott, John Brunger, George Wittlinger and Thomas A. Lee deserve much credit for the day's enjoyment. Games were indulged in. The hundred-yard dash for all was won by George Wittlinger; the hundred-yard dash for boys by Harold Gniff; potato race by Alfred Lee: three-legged race by Wm. Kastberg and George McIntosh; running broad jump by Wm. Kastberg; tug-of-war, Wm. Scott on one side and W. Melville Scott the other, Wm. Scott, winner,-Horticulture.

### SOUTHAMPTON (N. Y.) HORTICULTUR-AL SOCIETY.

The eighth annual exhibition of th's Society was the bes ever staged in Southampton. The postponement of the exhibition from the previous week proved to be a very wise move, for there was a wealth of flowers now in bloom that had not arrived

at maturity last week.

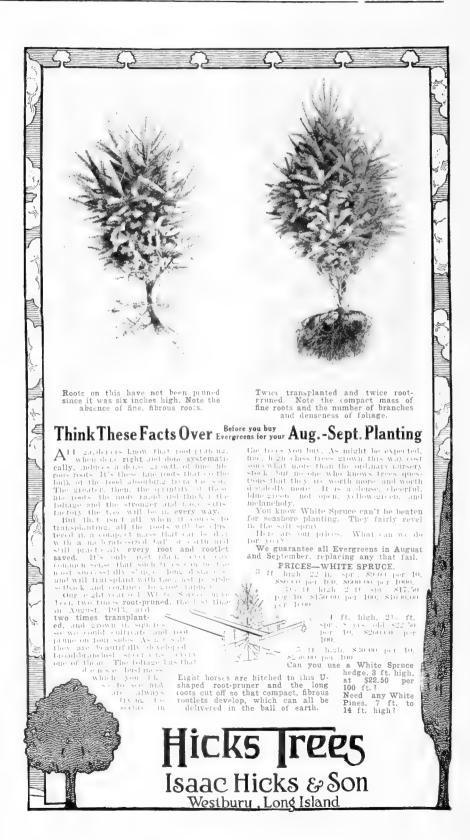

The exhibits were divided into five divisions. Division A included table decorations and decorative designs. Division B included cut perennials, annuals, etc. Division C included greenhouse and herbaceous plants in pots or tubs. Division D included ornamental stove and greenhouse plants. Division E included fruits and vegetables. The principal attraction was the exhibition of decorated luncheon and dinner tables, open to the women of the cottage colony only, the flowers and foliage used in the decorations to to grown by the exhibitor.

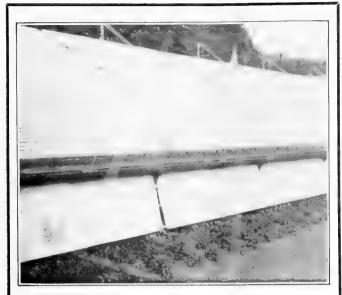

over 6 sprays in a vase-First, \$5; sec-| The judges of the exhibit: were G. W. | July 25 and 26. This exhibition was under Gilbert of Shelter Island, George Wiltinger of Tarrytown and Frank Niquet of Patchogue. One-half of the net proceeds will be donated to the Southampton Hospital.

# BAR HARBOR SWEET PEA SHOW.

The Bar Harbor Horticul aral Society held its second annual Sweet Pea Show on

the direction of the following committee: William T. Burton, chairman: Edward Kirk, Clarence E. Dow, John H. Stalford. John Renwick. The staging of the flowers was under the care of Arthur E. Thatcher. who had charge of the exhibits, and acted as manager for the show. William Sim and George Cruickshank acted as judges,

# Lathe Roller Blinds

Can be tassed droine it. Couldy pair of the day, and are now used on all the leading private estates for orchid, palm and stove houses. I have erected this patent shading on most of the leading private place in the country, and should be pleased to submit plans and estimates to any one interested. # Standard Cyclopedia of Horticulture

Title new Standard Cyclopedia of Horticulture has been freshly written in the light of the most recent research and experience. It is not merely an ordinary revision or corrected edition of the old Cyclopedia, but it is a new work from start to finish with enlarged boundaries geographically and practically; it supersedes and displaces all previous editions or reprints of every kind whatsoever.

It is the fullest, the newest, the most authoritative of all works of its kind and constitutes the most conscientious attempt that has ever been made to compress the whole story of our horticultural thought, learning and achievement into one set of books.

# Gardeners All Over the World Use

APHINE, for spraying against all sap-sucking insects, such as aphis, red spider, thrips, mealy bug and soft scale; and for cleansing palms and decorative stock generally.

\$2.50 Gal., \$1.00 Qt.

**SCALINE**, an oil and sulphur composition for spraying trees, shrubs and hardy stock against San Jose, oyster shell and other scale, red spider, etc. Readily soluble in water; mixes without agitation; does not clog.

\$1.50 Gal., 10 Gal., \$10.00, 50 Gal., \$37.50

FUNGINE, to control mildew. rust or bench rot in the greenhouse. a spraying material; an infallible remedy. It does not stain foliage as Bordeaux or lime and sulphur, but cleanses it.

\$2.00 Gal., 75c. Qt., 10 Gals., \$15.00

VERMINE, to rid the greenhouse soil of eel worm, root maggots and other soil vermin, will be found most effective. Used according to directions it is not injurious to vegetation.

\$3.00 Gal., \$1.00 Qt., 5 Gals., \$12.50

# DO YOU USE "NICOTINE"?

To meet the demand created by Agricultural Experimental Stations, favoring 40% nicotine solutions in their recommendations, we offer

# "40% NICOTINE"

SOLUTION

for fumigating, vaporizing and spraying, \$13.00 Gallon-\$3.75 Quart-\$2.00 Pint.

# **NIKOTIANA**

A 12% nicotine solution, properly diluted, for fumigating and vaporizing; most economical in using, \$4.50 Gallon—\$1.50 Quart.

Compare our prices with what you now pay. Then let us supply you.

THE RECOGNIZED STANDARD INSECTICIDE.

W. N. Claig writes in Florists' Review (March 5th, 1914): "Scale on greenlouse plants is not easy to get rid of, as doses which are sufficiently strong to kill the scale will usually disfigure the plants at the same time. I have found APHINE a first-class remedy for scale, and if you will apply it according to directions you will kill and loosen the scales, although they will not fall off, as will some other pests." It will only require the hose to wash off dead scale.

Our products are for sale by all up-to-date seedsmen. If your local dealer cannot supply you with our products, send us your order with remittance and we will ship immediately through our nearest agent.

### THE GARDENERS' CHRONICLE OF AMERICA.

OU look out the window some day and see two

men go past. One is of chunky, solid build, and he hustles perspiringly along with a great swinging of his arms. He impresses you as a man who is going to get there "if it takes a leg."

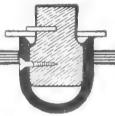

Man number two is of slighter build. He walks with a light springiness. He does not seem in a great hurry. There is no lost motion in his movements, however. No swinging of arms, but he is getting there just as the other fellow. In fact, he is actually as fast as the other fellow. In fact, he is actually walking faster.

If you and I could follow those two men throughout the day, man number two (the light, wiry man) would always be easily overtaking the thick set one. Always he would pass him.

It's exactly the same with greenhouse construction. The light, U-Bar constructed house beats all other constructions when it comes to actual growing results. Its slender strong frame of U-Bars has all the strength of the heavy framed houses, but none of the lost motion in actual results getting.

Some houses with curved eave attachments look like the U-Bar; but "looks are deceiving." If it's not built with U-Bars, it's not the U-Bar curved eave house.

To get a point by point pointing out, of the excelling points of the U-Bar house, send for the new catalog. Or send for us. Or both,

# Awakening Interest in Aquatic Gardening

By Wm. Tricker.

Aquatic gardening is apparently in its infancy, though aquatics are as old as the hills; but this class of plant now commands our attention. Aquatics are associated with the history of the ancient Egyptians, where mention is first made of the Egyptian lotus, Nelumbium speciosum, the worship of which was common with them. Sculptural representations of it are found among the ruins of Egyptian temples. It was not only known to the ancient Egyptians, but was common in olden times in East and West India, China, Japan, Persia, and Asiatic Russia. The Chinese have ever held it in sacred regard, but that character was not limited merely to ornamental purposes; the roots (or tubers) were used and still are as an article of diet. The American lotus, Nelumbium leteum, was well known to the Indians as an article of diet, but has of late been disregarded.

Nymphaeas are also widely diffused and are found in all parts of the world, each different country possessing species peculiarly its own. But of all the Nymphaeas no species can compare with Victoria Regia and although many species were known in England prior to the introduction of the latter, the cultivation of aquatics received a stimulus thereby, which extended to the United States, the effect of which is felt by us this day. The discovery of this wonderful plant by Mr. Bridges, an English traveler, in 1845. He successfully carried to England the seeds that produced the first plant which became so famous. This was in the year 1849, when a tank was built expressly for the new plant in the great conservatory at Chatsworth, under the man-

agement of Mr. Paxton.

It is interesting to note that there were progressive florists in the United States at this date, although neither rapid transit not ocean greyhounds were established. Yet, the result of such an achievement in floriculture was not only known here, but a similar tank and greenhouse were constructed, and the Victoria Regia was successfully grown by Mr. Caleb Cope, Philadelphia, Pa., in 1851. Considering the time when the Victoria flowered in England-November, 1849there was little time lost; and this act exhibited an enthusiasm and enterprise worthy of our day. The foregoing is the earliest record of aquatic gardening in this country. With the Victoria was also introduced Nelumbium Speciosum. The construction of the Victoria tank and house was such as to stimulate natural conditions. The warm water and tropical atmosphere were not enough; the water had to be kept in motion. A water wheel was constructed for this purpose and a stream of water constantly flowed which was conducted into a cistern or reservoir in the middle of the vegetable garden which was used for watering in those days before city water hydrants and hose were thought of. In this cistern the Nelumbium Speciosum was planted and was a great success. After this small aquariums and ponds were made out of doors by different people and aquatics were more or less grown.

It is sad to relate of this enterprising gentleman, as of many others since, that he died very shortly after this event and that the glory and pride of this horticultural establishment thereafter departed, and on this historical spot stands the Forrest Home for aged

actors.

Yet another and pleasing feature in connection with this first Victoria in the United States, and which makes this event most interesting. We had until recently at the head of the Department of Parks in the capital of the Union a man of singular ability, experience and judgment who was an employee in the gardens of Mr. Caleb Cope when the first Victoria and lotus were grown. I refer to Mr. Geo. H. Brown, now deceased.

The state of Massachusetts appears to have been the next in order of date where the cultivation of the Victoria Regia was engaged in. The earliest grower in that state being John Fisk Allen, of Salem, who on June, 1883, exhibited Victoria Regia at the rooms of the Massachusetts Horticultural Society. The Victoria still led the way and in the year 1856 it was grown in Cincinnati by Mr. Geo. Pentland, gardener to Nicholas Longworth, Esq., but its cultivation did not become general and would not now under such

expensive modes of culture.

Attempts to cultivate Nelumbium speciosum are reported prior to Mr. Cope's venture. The archives of the Pennsylvania Horticultural Society contain the following report: "At the meeting held on February, 1840, the committee on distribution of seeds submitted their report, from which it appears two parcels of seeds had been received, one from Calcutta, presented in 1838 by Dyllwyn Parrish, containing among other things seeds of Nelumbium Speciosum and N. Album, and Mr. R. Buist succeeded in raising plants of these species which were considered very rare in this country if indeed they existed, except from these Calcutta seeds."

From 1856 to 1876 very little was done in the way of aquatic gardening, but at the latter date Philadelphia was again to the front and a plant of Victoria Regia was a novel and attractive feature of the Centennial Exposition. In 1886 aquatics were introduced into Central Park, New York. Nelumbium Speciosum is there naturalized and is one of the most striking features of the park. In 1888 L. W. Goodell appeared on the scene with a tank of aquatic plants at the annual exhibition of the Massachusetts Horticultural Society. A year later H. H. Hunnewell exhibited a collection.

Amateurs now commenced to cultivate the aquatics and choice specimens were to be seen at Newport and in the neighborhood of Boston, Chicago and other cities. Mr. Chadwick, president of Chicago Horticultural Society, grew aquatics which undoubtedly led to the introduction of these plants into Lincoln Park in 1888, then under the able management of Supt. J. A. Pettigrew. The cultivation of Victoria Regia as well as all available Nymphaeas at that time has given Chicago and her parks a world-wide reputation. Other parks and gardens have introduced aquatics with surprising results and to-day they are the most popular plants. The Victoria has been grown in the Botanic Gardens, Washington, D. C., since Dr. Bahnson, after several attempts, succeeded in flowering the Victoria in the open at Salem, N. C., grown without artificial heat.

It must necessarily be late in the season before planting out or run the risk of losing all. In many cases where steam power is used in factory, pump or for other purposes, the waste steam can be used for the heating of the tank, but the safect and best method is to have an independent heating system. The introducing of Victorias into our gardens and parks opened up a wide field for the general cultivation of tropical Nymphaeas which has now become general in

most of our public parks, also by a large population of the wealthier class who own and maintain beautiful grounds. A few enthusiastic amateurs who grew aquatics for pleasure and recreation have done much for the advancement of this now popular class of plant, and it may safely be said that in no other country can such aquatic gardening be seen at the present day as in the United States. In England, where every known variety finds a home, few, if any, growers have venturned to cultivate Nymphaeas save in aquatic houses, hence it is very difficult to compare the same or to know the species by description of plants grown under glass with less light and solar heat, as given. The plants here are more vigorous, have more substance, and the color of the flower and foliage is intensified.

We are all familiar with the name water lilies, though a misnomer, and we all know that Nymphacaea is not Liliacea; we might rather call them water roses, as our friends do across the big pond. Any way we know them as water lilies and when we hear that word our minds at once carry us away back to our childhood years and places where the water fily grew, whether in this or any other country. But to the general mind it conveys the picture of a white flower, in all its purity, as white lilies predominate in the temperate zone. Our Eastern fragrant pond lily, otherwise known at Nymphaea odorata, is white; the pond lily of the middle and western states, N. tuberosa in numerous forms, is also white. The European lily, N. alba, N. candida, is also white, as are also the Japanese species, N. Pygmea. These species are the progenitors of a host of varieties, embracing all shades of color, save blue; yet including a most valuable color not mentioned before, that of vellow. This color was introduced through the admition of N. flava, the Florida or southern species. This species is not perfectly hardy in the eastern or western states, but it plays a most important part or place in the make-up of our magnificent collection of hardy water-lilies.

It was this species that first attracted the great hybridist, Latour Marliac, and by uniting or crossing the two species, N. tuberosa and N. flava, produced that magnificent variety, N. marliacea chromatella. The blood of N. flava is readily traced in all water-lilies that have yellow, if only faintly, in their make up; not only in their flower, but the foliage tells tales; there is the spotted or marbled foliage more or less in evidence.

Next in color comes pink and the only known pink variety was Odorata rosea, but here the curtain remains down. The dark colors did not come suddenly, and from my experience I find that color is intensified in the crossing, the pollen parent conveying both color and size. The only known species and the one that has played so much in this class is N. sphoerocarpa or Alba rosea, the Swedish lily. The first hybrid that appeared in the pink color was N. marliacea rosea, which was in 1887, parentage unknown, only to the hybridist. Next was N. laydekeri rosea in 1892,—I may here

Next was N. laydekeri rosea in 1892,—I may here say in passing that the group known by the prefix Marliacea are among the best of all Nymphaeas and will ever stand alone, distinct in color, form and symmetry. These are N. marliacea albida, carnea, chromatella, rosea, flammea, ignea, rubra-punctata,—this was sensational in color, form and floriferousness. It resembled N. alba rosea in color, but intensified, varying in color from a soft tender pink to rosy carmine and deep carmine. This was indeed novel, but the flower was undersized and as larger flowers made their appearance this almost vanished out of sight until it is now hardly ever seen. I know of but one section in this country where it was a success—northern New York State.

But as new and larger flowers came rapidly into the market, even at higher figures, this charming hybrid became scarcer and scarcer and few of this group ever existed. We have only Laydekeri rosea, fulgens, purpurata and lilacea. These are excellent varieties for tub culture and small basins. As a species I do not know of a darker pink than N. alba rosea or Sphoerocarpa, and less than three decades ago we had only a few species of the hardy water lilies, whereas at the present time we have over one hundred varieties, the progeny of these three cardinal colors, white, pink and yellow. It might be nice to include blue, but I am thankful it is not hardy and believe it never will be. But let us turn to the field of tender Nymphaeas. A few species have been known for a number of years: N. Rubra, the India species; N. Capensis, of South America, and N. Coerulea, of North Africa, and associated with Egyptian history, and N. Lotus.

The India species are night blooming and it is well they are, for they cannot endure our summer sunshine, let alone that of India. The first variety we are familiar with is N. Devoniensis, named in honor of the Duke of Devonshire, origin unknown, or questionable, but it is a form of N. Rubra; the latter species and N. Lotus or dentata are the species from whence came our selected group of night bloomers, embracing many of the choicest water lilies now in cultivation, also the largest flowers, these if not all are of American origin.

The blue water lilies all hail from Africa or nearby places. The N. Zanzibariensis comes from Zanzibar, and N. Gigantea from Australia. The latter is very difficult to cultivate, but it can be grown and I think it surpasses every known blue water lily in cultivation. Of late another species has made its appearance or has been brought into prominence, Micrantha. This is entirely distinct, being of a viviparous nature—producing a distinct and separate plant from the upper surface of the leaf just over the insertion of the petiole. Another characteristic is its wonderful floriferousness, perpetual flowering and producing extra sized flowers in the depth of winter, the color of which is not affected by the short and dull days.

In the early eighties an army doctor in Salem, N. C., turned his attention to water lilies and succeeded in growing several varieties and was tempted to try a Victoria Regia out of doors, and after a time succeeded in having a plant flower out of doors without artificial heat. This, I believe, was the first on record. Amongst his Nymphaeas, which were largely hardy kinds, appeared a fine pink variety, a natural cross, not a hybrid. This latter was put on the market as N. Odo Caroliniana. I regret this variety has disappeared, although the name still exists. About the same time John J. Gardner, brother of Richard Gardner, both enthusiasts, both specialists, was gardener for Jerry Lorillard, at Jobstown, N. J. He, too, grew some water lilies, and about this time they were introduced into Central Park, New York City, and the parks at St. Louis, where the veteran James Gurney is still at the helm, who has done so much for horticulture and has been a masterhand at aquatics and where the finest specimens of Victorias are annually grown, none better, if as good. I must mention right here in another opposite section of this vast country another doctor of medicine, Dr. Faunce, of Yarmouthport, Mass., who is an amateur, was a lover of horticulture and grew the newer up-todate water lilies as M. B. Latour-Marliae and put them on the market, for at this time these marvelous productions were arousing such an interest in England and France and, consequently, America. At the same time and in this same locality our lamented fellowworker James Beydon resided, who was gardener to

U. S. Simpkins. He was an expert, a mighty man, and any of you who have ever crossed swords with him at an exhibition knew you were up against it when you had to compete with him, in whatever line, not excluding Nymphaeas and other aquatic plants. To him I give the palm, not only as one of the best growers, but as one of our foremost hybridists. It was he who produced one of our grandest and best of hardy Nymphaeas and I am proud of having named that grand variety N. Jas. Brydon in honor of him.

I must again refer to our worthy chief who has crossed the great divide—John A. Pettigrew—who made for himself a name in Chicago. He moved on from there to Milwaukee and constructed lily ponds there. He eventually returned East and was superintendent of Prospect Park, Brooklyn, N. Y., where a system of ponds were constructed and are to this day the pride of Brooklynites and all lovers of horticulture. Mr. Pettigrew eventually moved on to Boston where he continued his active work in horticulture and he left these works as a monument to his memory.

I must not omit to mention another worthy amateur who also played his part in promoting the culture and spread of aquatic lore, S. C. Nash, of Clifton, N. J. He turned a swamp into a veritable paradise and in addition to this he constructed a tropical garden and here were grown some of the finest specimens of Victorias, the most beautiful of all water lilies, N. Gigantea and many other species. He was also a masterhand with the camera and many beautiful pictures and photographs of the water garden are his workmanship. George V. Nash, of the Bronx Botanical Gardens, is a son of S. C. Nash. These gardens are the pride of New Yorkers and the water gardens and pool are visited by thousands in the season and are not surpassed by others in the United States.

In the central states aquatic gardening has its devotee in the person of E. T. Harvey, of Cincinnati, Ohio, an artist who has for several years had a charming pool effectively planted and heated by a simple device, using gas for heating. Here are to be seen fine specimens of Victoria together with other tropical Nymphaeas and Nelumbiums.

I have left the name of one to the last to mention because I feel that through him we arrive at the pinnacle or climax of Nymphaeas. His name may be unknown to many of you, but it was my privilege to work side by side with him. He was a student in the University of Pennsylvania; he was fired with a love for the water lilies and it was his privilege and opportunity to visit the water gardens at their nurseries at Riverton, N. J., when I was in charge of the same. Here he could study the many species and forms which only added to the difficulty, as there was a maze of names so synonymous that it was chaotic. He was assisted by the University to visit Europe and with letters of introduction was admitted to Kew, the National Museum and similar institutions on the Continent and examined the ancient herbariums and manuscripts. Nothing like a complete synopsis of the water lilies had been put before the English speaking world until this working student, Henry S. Conard, returned from Europe and wrote his symposium or monograph of Genus Nymphaea and which was published by The Carnegie Institution of Washington in 1905. I regret very much that Dr. Conard has left this field of research and is now located at Grinnell, Iowa, in some other field of exploration. He is the author of the book "Water Lilies and How to Grow Them." He also contributed much on the Nymphaeas for Bailey's Cyclopedia of Horticulture.

# PELARGONIUM "CLORINDA."

BY CHARLES H. TOTTY.

The illustration shows a well-grown plant in an 8-inch pot of this little-known Pelargonium. The plant when photographed carried three hundred and twenty trusses of flowers, four feet across, and was three to three and one-half feet high, and had given a continuous succession of bloom from the first week of February to the middle of June. This plant was grown about eighteen months from the time the cutting was inserted in the sand until the picture was taken by James Fraser, superintendent of the Cedarcourt Estate at Morristown, N. J.

In addition to the bright rosy cerise flowers which

PILARGONIUM "CLORINDA"

made a wonderfully attractive plant, the deep green foliage has a delightful fragrance when crushed in the hand. I feel sure if more of your readers were acquainted with this Pelargonium they would make it a point of having at least half a dozen plants for cutting and conservatory decoration. It cannot in any sense be called new, and yet it has almost disappeared from cultivation. With the general broadening of horticulture many varieties of plants such as this Pelargonium will come to the surface and eventually be recognized at their true worth.

# THE PLANT THAT COUGHS.

That there are meat eating plants is generally known, but that there are also plants that cough—not figuratively, but in the true, literal sense of the word—will be surprising to most readers. Indeed, to the researches of a French botanist we owe the description of a plant growing in certain tropical regions which obviously "coughs" like a human being. The plant externally is in many respects related to our common bean. It is very sensitive, and shows a strange dislike of every kind of dust. No sooner do a few grains of dust settle on its leaves, and thereby irritate the air chambers of the sheath scale, which represent the organs of breathing, than these organs fill with a kind of gas, swell up and then explosively reject the gas, whereby the dust is expulsed. But this explosion produces a sound that has a striking resemblance to the cough of a child that has caught a cold. The stranger who, in the midst of the wilderness, hears the sound, involuntarily looks about for some man or animal, and discovering, of course, nowhere a living being that might have coughed, will be seized with the uncanny feeling of the presence of some spook.

# JAPANESE BLOODLEAVED MAPLE.

The great beauty of the Japanese Blood-leaved Maple is sufficient reason for its general presence in so many of our gardens. We refer to the one known as Acer polymorphum atropurpurem, writes Joseph Meeham in Florists' Exchange. It is in Spring, when its lovely bloodcolored leaves are in their full expansion, that its great beauty is presented, the rich red foliage being then at its best. This color is held without much change until Summer is well advanced. It changes with the heat of the season, becoming dulled by the sun, but until Autumn there is a distinct red color to the foliage. There is no other red foliaged small tree or shrub its equal in its way, and of its general hardiness there is no question.

Because of its appearance as a shrub on our lawns many do not know it grows to the height of a small tree, but it does. There are some of them about Philadelphia 18ft. to 20ft., having a spreading, bushy habit, not unlike bushy forms of Acer campestre that one sometimes sees. But these large ones are, some of them, perhaps 40 years old, as it is from 40 to 50 years since plants of it were introduced to Philadelphia gardens. Some have supposed them as first appearing here together with the Japanese who represented their country at the Centennial Exposition at Philadelphia in 1876, but this is a mistake, as there were plants of it in the Meeham nurseries before that, coming, it is now believed, from a German nursery from

which importations were then made.

Those who plant this blood-leaved Maple in a shaded place make a great mistake, as it will not take on its rich red color in such a situation; instead the foliage will be almost green. Nurservmen often are charged with having supplied a spurious bush in cases like this, the owners, knowing nothing of the requirements of the bush, placing it under the shade of large trees or in other shaded positions. Even when a bush is in a proper open position, should the upper branches closely press on those below them, it will be the upper ones only that will be of the blood color of best type as are the leaf stems as well. The whole appearance of the tree is so unlike any other that to have a specimen of it on a lawn is considered a great acquisition. It is of Japanese origin, and but the one species, Japonicum, is known, and, fortunately, it proves hardy with us in our severest Winters. It cannot be praised as a flowering plant, for its flowers are so small and colorless—save for its stamens, which make some display—that to many it passes as producing none. Then, being of a directions nature, the male and female flowers are on separate trees, so it is only when two trees of an opposite character are near each other that seeds are produced. These seeds come in short pods, are very small, but vegetate well, hence there is no trouble in getting a stock of seedlings rapidly when seeds are procured.

Besides propagation in this way, there is that of layers, and cutting of young shoots in Summer, to help along

in adding to one's stock.

This tree presents its best appearance when growing in deep, moist ground. Then its foliage is presented at its best, much superior to what it is when in positions lacking moisture. Botanists tell us the Cercidiphyllum is closely allied to the Magnolias, but there is nothing in the general appearance of the tree to indicate this.

# WE ARE ALL ALIKE.

"We're all alike, it seems to me No matter what our stations; For we all prune the family tree By cutting poor relations."

# WINTER-FLOWERING GREENHOUSE HEATHS.

At one time collections of greenhouse Heaths formed a prominent feature of many gardens, but with the decline in popularity of hard-wooded plants in general, many of the Heaths disappeared from cultivation. A few kinds, however, are still grown, and as a rule in very large quantities, for some of the nurserymen who make a specialty of them generally devote the greater part of their energies to these greenhouse Heaths and similar plants, such as Boronias and Epacrises. Delightful little specimens of these may frequently be seen in the florists' shops, especially during the autumn, winter and early spring months, the summerflowering kinds being, naturally, not so much in demand, though of them the attractive Erica ventricosa is still grown. After the summer is over, the Heath season may be said to begin with E. gracilis, a dense, twiggy little bush, whose tiny rosy purple flowers are borne in great profusion. Several varieties of this Heath are in cultivation, namely, rosea, in which the purple tinge of the flower is almost wanting, it being of a pleasing rosy shade; and vernalis, of more sturdy growth than gracilis itself, and much later in flowering. There are two white or pale flowered kinds, namely, alba, the oldest, in which the blossoms often have a pinkish tinge. They are decidedly less pure than those of nivalis, which is now extensively grown.

After E. gracilis comes E. hyemalis, a great favorite, and always in considerable demand about Christmas There is a variety of this known as superba, whose flowers are deeper colored than those of the type, also a variety alba, in which they are pure white.

Another winter-flowering Heath that has come prominently forward within the last decade or so is E. melanthera, which may be grown into larger specimens than any of the others. The flowers of this, which are borne in great profusion, are small and of a distinct mauve color, with blackish anthers. The lowgrowing, white-flowered E. caffra is also grown to a limited extent.

Of those that as a rule bloom somewhat later than the preceding, but yet may well be included with winter-flowering Heaths, are E. wilmoreana, somewhat in the way of E. hyemalis, but of a more robust, spreading habit; and E. persoluta alba, with a profusion of

tiny white bells, gracefully disposed.

All the different winter-flowering kinds alluded to belong to what are termed soft-wooded Heaths, from the fact that they are readily propagated by cuttings of the soft-growing shoots; whereas many of those that used to be grown as large specimens could only be increased by cuttings of a firmer nature. soft-wooded cuttings are, as might be supposed, very delicate subjects to handle; hence everything should be prepared before they are taken in hand. They are best covered with a bell-glass, so that the size of the pots or pans will depend upon that of the bell-glasses available. Whether pots or pans, they must be filled to within an inch of the rim with broken crocks, coarse at the bottom and very fine on the top. The soil should consist of peat and sand passed through a sieve with one eighth of an inch mesh, and made very firm and smooth. In inserting the cuttings, each one must be made quite firm, and though space should not be wasted, overcrowding must be avoided. A length of about an inch is a suitable one for the cuttings, in preparing which a very sharp knife is essential. When a pot is filled, it should be watered through a very fine rose, allowed to drain, and then be placed in a snug part of a warm greenhouse, taking care that the outtings are shaded from all direct sunshine. When rooted they must be potted off, the subsequent treatment being a matter of detail. It must, however, be borne in mind that it takes nearly three years to obtain

a good plant.

Where it is intended to keep the old plants after flowering and grow them on another season, they should, when the blossoms are past, be cut back hard, and as soon as the young shoots make their appearance the plants must be repotted, giving them in most cases a pot one size larger than before. The soil should be peat and sand, pressed down very firmly, and especial care must be taken when repotting that the ball of earth is not dry, otherwise it will be almost impossible to moisten it in a satisfactory manner.—The Garden.

### HARDY PERENNIALS FROM SEEDS.

Attention may be directed during the present month to the sowing of any hardy perennials not on hand that are likely to be in request for another season. Such sowing may be recommended from a double standpoint. In the first pace, seedlings of good things thus acquired may take the place in prominent borders of more common plants; and in the second, because a batch planted in some outlying part of the garden is always acceptable for cutting. A portion of a narrow slip garden, especially if the soil is naturally deep and moist, will be found useful for the purpose, and the species and varieties of the same can be planted here in beds of 4 feet, 5 feet, or 6 feet, as may be deemed advisable, with intervening alleys of 2 feet to admit of cutting the flowers without too much treading on the beds. To the lover of hardy plants, propagation of this kind is peculiarly interesting, and the seedlings are watched with keen interest right away from their first appearance above ground until the flower is clearly defined. I prefer boxes to the open ground for sowing, the double advantage being that while yet in a young stage there is better opportunity of warding off the attacks of insects, and, in the case of seed-sowing, the chance to particularize in the covering given to different seeds. The seeds are sometimes very tiny, and, naturally, only require the least bit of soil on the top. The strips of wood at the bottom of the boxes should be fairly close together, not more than 1/4 inch apart. A few small crocks may first be placed, followed by 1 inch of rough leaf-soil, the remainder of the compost consisting mainly of old potting soil, not too dry, to which have been added a bit of fresh leaf-mould and a little sand; the surface should be even throughout, and pressed fairly firm. Prepare the boxes as it might be to-day, give a soaking of water, and sow to-morrow, taking care the seed is evenly covered, and, as hinted above, discriminating as to the depth of covering according to the size of seed. Place the boxes in a frame facing north, and shade in bright weather. Be careful the squares of glass are intact, as water running in on the soil will wash out the smaller seeds, and, as germination takes place at various periods, the boxes must be carefully watched.

It is not necessary to occupy space with a list of things, because the majority of herbaceous plants can be raised in this way, and the list would naturally be a long one. It may, however, be pointed out that, with the demand for cut flowers ever on the increase, preference should be given to those things that can be utilized for this purpose as well as to make a display in the garden. The selection should also be comprehensive so far as the different seasons are concerned. I noted above that a planting to furnish cut bloom might

find a place in a slip garden. If there are trees it may not be advisable to plant close up to them, but many of the things that can be selected will be benefited by partial shade. It is hardly necessary to add that not the least interesting point in this propagation of hardy flowers is that it is within the reach of all flower-lovers who can command a small cold-frame to receive the seed-boxes, and one of somewhat larger size for pricking out the seedlings until they can be consigned to permanent quarters.—*Exchange*.

### DASYLIRION GLANCOPHYLLUM.

The accompanying photograph of Dasylirion Glancophyllum is one of a pair which flowered the past month at Pembroke, the country estate of Captain J. R. De Lamar, Glen Cove, L. I., over which Robert Marshall presides as superintendent.

It is a Mexican plant and belongs to the Ord Liliace. Flower spikes were about 10 feet high with Catkin like flowers of a creamy color covering four or five weeks

luration.

They winter it in the cool greenhouse and being evergreen it makes a very interesting subject. In Summer they use it out doors as shown in picture.

Ordinary Carnation soil with 1 third leaf mold seems to suit their requirements with plenty of water during Summer.

DASYLIRION GLANCOPHYLLUM.

# History of the Gardening Profession—Its Progress

By Arthur Smith

It is with some diffidence that I venture to address you upon this subject, more especially in Boston, in a state containing perhaps more thoroughly well-managed private estates than any other in the Union. But as our association is a national one, I consider myself as speaking not only to those present, but to all private gardeners

through the country.

There are no doubt several ways in which this subject could be dealt with, but the point of view taken by myself is that our work in its real and highest sense requires an education as wide, as deep and as scientific as that which is necessary to fit a man to be, for instance, a qualified physician. A large number of gardeners have this education and are therefore entitled to be looked upon and treated in the fullest sense as professional men. Unfortunately, however, a much larger number of us have it not and are deficient in that thorough, all-round knowledge of, what may be called, the technique of our work.

Most of us, I imagine, wish to see our profession advance and this idea causes me to propose taking most of the time given me in dealing with some of our faults, for I believe that there will never be any real advancement if we only meet to pat one another on the back and resolve ourselves into a mutual admiration society, which is too often the practice of horticultural societies.

If my method proves to be unpopular it cannot be helped, and in that case I must ask you to blame the facts

rather than myself.

At the outset I would suggest that a much wider meaning be attached to the word gardener; in fact, some have thought that a more official recognition be made of the scope of our work, which, in the majority of cases, includes every phase of estate management. Of course, the word itself is good enough for any one; but there are many gardeners, however, who not only refuse to give themselves much trouble about anything outside what is strictly a garden, but seek to narrow it down still more within itself, causing estate owners to complain of the difficulty in getting men to take an interest in their This matter will be alluded to more at length later on.

The statement that the first man was a gardener has often been made as evidence of the antiquity of our profe-sion, and even those who look upon the story of Eden as an allegory must admit that the writer of it could not conceive a happier condition upon earth than that of living in a garden nor imagine a higher calling than that

of caring for it.

Casting our eyes down through the ages there is any amount of evidence to show that a garden has always been one of the adjuncts to man's abode where conditions

of settled government permitted.

Time does not allow me to multiply examples, but the wonderful terraced-sometimes wrongly called "hanging"-gardens of Babylon may be instanced as showing to what a remote period artistic genius in creating landscape effects and love of the beautiful existed.

Another striking example is the amazing engineering skill shown upwards of four thousand years ago in planning and creating the wonderful irrigated gardens of Egypt whereby veritable Gardens of Allah were made

in the desert.

In China, India and Persia gardening was a universally practised art in times before the dawn of history. The Greeks, among whom public gardens were a great feature, copied their style from Persia, and when the

Roman Empire was at the height of its prosperity two thousand years ago horticulture was classed among the most honored callings. Many of the most noted senators of that period went to the Senate literally from the plowbandles. Flowers in the greatest profusion were always in evidence at public and private festivals, and the Goddess Flora held one of the highest positions in the religion of those times. Among the most noted writers of the period were those who used their literary ability in advancing the art of soil cultivation and plant growing. and although they did not know anything about the scientific principles underlying their practice, yet the most advanced methods of that day were in many respects no way behind those of the present; in fact, the majority of farmers in this country today do not farm so well as did those ancient Romans, and many of the precepts advocated by those writers could with great advantage be put into practice upon gardens and farms at the present moment.

In all times man has, in his desire for the beautiful, added a flower garden to his house and even in the interior of South Africa I have seen Kaffir huts with a garden around them planted with flowers; a striking contrast to thousands of houses in this country today with ground around them but no garden.

There is ample evidence to show that from immemorial times there have existed private estates with elaborate ornamental grounds, and public parks and gardens which required skilled men for their management and upkeep, and apart from this obvious fact ancient writings bristle with statements showing that our calling as a distinct

ARTHUR SMITH, READING, PA.

profession has been throughout all the times of the ancient civilizations most highly thought of.

So far as I am aware the first attempt to form our profession into an association was in the year 1345, at which date the City of London Guild of Gardeners was established, about which the courtesy of the secretary, Mr. E. A. Ebblewhite, has enabled me to learn many interesting historical details which time will not permit being fully mentioned.

At that period guilds were common both in England and the northwestern part of Europe, this guild of gardeners being the sixty-sixth that was formed in London, each of them being for a different craft. guilds were established for the one and all-embracing object of securing the highest possible efficiency in the respective craftsmen, and also to see that no inefficient, unskilled men practiced a craft. As these objects were undoubtedly for the public interest, the guilds had the support of the law, and the guild of gardeners had the power under their royal charter of causing the arrest of all persons carrying on the trade (as they called it) of a gardener without the consent of the guild; that is, of men who were not skilled craftsmen. At the present day a body with that power would be kept fairly busy in this country.

Although some of these guilds still exist, the march of time has caused their power to become obsolete. This guild of gardeners now confines itself to giving a scholar-ship tenable for two years for the purpose of assisting young gardeners in their horticultural studies. Its members also take an annual outing, which this year was spent in visiting some of the fine old gardens still to be found in France, which managed to escape the vandalism of mob law.

Some people have been ignorant to state that these guilds were practically the same as trade unions. As a matter of fact, the similarity between the two is like that of chalk and cheese.

Guilds were formed and supported by men of the highest principles, by men whose probity was unquestionable, who possessed wide and high ideals and who sought in every way possible to elevate the standard of craftsmanship to the loftiest plane. So far at least as the guild of gardeners was concerned, and there is no reason to suppose any difference in the case of others, the question of remuneration was never once made the subject of even discussion, much less action.

One of the objects of our association is to obtain the recognition of gardening and estate management generally as a profession. A clause in article 1 of our constitution reads, "To uplift the profession of gardening by endeavoring to improve conditions within it." Some think that one of the best ways of obtaining improved conditions is to secure higher salaries. In the first place it must be borne in mind that a man who is receiving all the pay he is worth is on the down grade; and secondly I venture to think that if every gardener's salary were raised 50 per cent, tomorrow, it would not have the effect of uplifting the profession by a hair's breadth. If we really wish to benefit ourselves we must go deeper than this.

The failure of our profession as a whole to reach the position to which it has the right to aspire is caused by the fact that the rank and file of it do not fully satisfy estate owners' requirements; in other words, the profession is being held back by the number of incompetent within its ranks.

You probably think this a very strong statement, and I do not for a moment expect it to be a popular one, but it is one which is certainly warranted by facts within my own knowledge, and as regards its popularity I am not

in the position of a demagogue on the stump for votes, but in that of a man thoroughly convinced of the seriousness of the disease from which our profession is suffering which requires the infliction of pain to place it on the road to convalescence and to cause it to open its eyes to the obstacles in the way of reaching a healthy condition. To know the cause is the first step towards a cure.

It has happened that during the past twelve years my work has principally been that of starting private estates in various parts of the country from Long Island to as far west as Washington State, and during this period circumstances have given me many opportunities of meeting estate owners other than those for whom I have worked upon what may be termed neutral ground. It has thus been possible to learn something of the employers' point of view and to hear statements regarding their difficulties in respect of men whom they have put in charge of their estates, which, together with numerous incidents that have come under my own observation, has placed in my possession many facts which go to support the assertion I have made.

It is, I think, a pity that the word gardener is too often taken in its narrowest, instead of the widest, sense. It should be looked upon as including all phases of estate management, not, as is the extreme position taken by some, that anything outside a greenhouse as being outside either their interest or study.

A resident in Boston said to me a year or so ago that it is lamentable how comparatively few men there are seeking positions to take charge of private estates who know anything about hardy plants. A few years ago an estate owner had all his glass pulled down so as to take away any excuse for the continual neglect of his shrubbery, herbaceous borders and other outside work. In another case the estate was shut down entirely on account of the owner becoming disgusted. On an estate, which there is no harm in saying is in Massachusetts, the owner told me that he had been trying for years to get a gardener who was interested in botany and the natural flora of the country with a view to encouraging the growth of native plants in the wilder parts of the grounds surrounding the house, but without success. He remarked how strange it seemed that the average gardener should take practically no interest in hardy plants and wild flowers.

I do not in any way belittle the value of the florist's side of our profession. Those of us who visited the New York Show last spring must have felt great pride in the splendid exhibits which private gardeners made there, and which, by causing private estate owners to take great interest in it, contributed much to the show's success.

But why should a professional gardener who is an expert florist stop at that? Why cannot he be as expert in all other branches of estate management?

Most estate owners have a different conception of what constitutes gardening than they had even ten years ago. Things horticultural are upon a much higher and more artistic level and will become more so as the teachings of Nature and nature study bear fruit. Employers today require something more than the artificial production of the greenhouse and the profession must keep pace with the march of these newer ideas.

It appears to me to be unreasonable to expect an estate owner to pay a large salary to a one-sided man, however expert he may be in one thing, more especially if the employer requires more of something else that the manager understands little or nothing about, and does not even show himself willing to take the trouble to learn.

Of course one is not blind to the fact that there are many first class men, men possessing wide and deep pro-

fessional education, who are not receiving the appreciation nor remuneration they deserve. To the average professional man in the fullest sense of the term his work is a labor of love to which he gives his entire self. Many men are discouraged and prevented putting forth their best by reason of want of encouragement on the part of their employers. A man takes up his work day by day with renewed vigor if he knows that he is appreciated; that his constant striving after more and better results—frequently under difficulties which his emplover could remove—is recognized and that his position as a professional man is acknowledged. This goes further than an increase in salary. Not that an increase in one's income is unwelcome to any one, but no amount of salary will compensate for want of appreciation, especially when coupled with a policy of petty pinpricks and a constant inculcation of the idea that a professional gardener is nothing more than a servant.

Referring to the men who will take a position as gardener for the wages of an ordinary laborer, I do not think we need worry ourselves about the competition of these mongrel gardeners, for the competition is more likely to

come from another and higher direction.

It is no doubt a truism that lookers on see most of the game, and a man whose position enables him to see very clearly facts both inside and surrounding our profession, said to me early this year, "If you gardeners don't wake up you'll find your occupation gone." He alluded to the fact that men are graduating every year from colleges who have taken the course in agriculture and kindred subjects and who for that reason consider themselves fitted to take charge of private estates. This is the direction from which the competition is coming. If we wish to hold our own and obtain that full recognition and remuneration to which the requirements of our profession entitles us, we must take steps to put ourselves really in the professional class by acknowledging the value and necessity of scientific knowledge.

Employers are in many cases under the impression that a college man is necessarily better than one without college education. The college man lacks practical experience and until he gets this he will be as onesided as the practical man is without the scientific knowledge. In the latter part of July an advertisement for an estate manager contained the words, "No college graduate

need apply.'

Unfortunately the average practical man ignores the value of science. This has probably been caused by his confusing the facts of science with the mere theories of scientists. It is not necessary to attend a college to get a working knowledge of the scientific principles of our profession, for by attending the Fireside University we can place ourselves in the position of having a far wider and deeper professional knowledge than the man who goes through college before he has had any practical experience.

The best of us must realize that we do not know it all We must give more time to the reading of high-class technical publications and scientific text books. I have always thought it a great pity that a publication like *Garden and Forest* ceased to exist because it did not receive sufficient support from us. It was a thousand times ahead of anything published in this country both before and since; that it had to be given up was the reverse of creditable to the profession and proves how little is the general desire for greater technical knowledge.

At any rate we must open our eyes to the fact that scientific education in our profession has come to stay. Universities all over the world are placing farming, gardening and forestry in a position of greater prominence. Those who know what Oxford and Cambridge universi-

ties have stood for during many hundreds of years will realize this when they know that these have now placed our profession upon the same footing as all the other learned professions have previously stood. The importance of a wider education along these lines is now recognized in Britain by the fact that the possession of a diploma by those seeking positions as head gardeners is becoming imperative there. This will, I hope, be the case in this country before many years.

I am afraid my time has more than expired, but to sum up the matter we must realize that our future depends upon ourselves, and the first step in uplifting our profession must be that of rallying together and forming a strong association. We must grasp the fact that our position in the horticultural world is totally distinct and different from that of the other interests within it, we

shall have to stand or fall by ourselves.

Horticulture supports numerous societies, which it is unnecessary to recapitulate. Each of these societies have been formed for dealing with the special interests involved and for no other. All these societies can, and it is desirable that they should, cooperate with each other and with all in the interests of horticulture as a whole. But we must not forget that while cooperation is one thing amalgamation is something entirely different. Take, for instance, what the Rose Society has accomplished during he past few years. Supposing that roses, sweet peas, and all the other flowers having their own societies had all been in one society what progress would have been accomplished in connection with each of them? I venture to think very little.

Then take ourselves. The commercial florist has no more knowledge of our distinctive problems than we have of his. He has his own troubles which are obviously upon an entirely different plane to our own. If at any

nt our interests touch that is the place where we can cooperate. But no society has anything to gain, in fact, everything to lose, by amalgamating with any other whose work is upon an entirely distinct basis.

We desire neither patronage nor charity, and I should hope we have not yet reached the low stage of seeking people to do something for us. If a profession like ours, after existing for many thousands of years has not sufficient backbone to do things for itself, then the time has arrived when it might as well cease to exist altogether.

However strong any individual organization may become among those connected with its special interests, I do not see how that fact can do harm to any of the others

One is, however, led to think that there are persons within the bounds of horticulture who consider a strong and virile National Association of Gardeners a thing to be deplored. They appear to be jealous of the progress we are making, as if our growth were their misfortune.

If there are some who object to our "playing in their yard" it is of little consequence. Our yard extends from Maine to California, and no one need care a continental, so far as our professional interests are concerned, whether Boston, New York, Philadelphia, or any other city, is the Hub of the Universe; in this matter every one has a right to his opinion, but he must be manly enough to concede to others the right to theirs.

Taking horticulture as a whole, we occupy a far more important position than any other section of that industry. According to the census returns for 1900 (those for 1910 not being yet complete) gardeners numbered thirty-eight thousand and commercial florists seventeen thousand. Of course, the numbers are in both cases greater today, but there is no reason for supposing that there is any proportionate difference. No two distinct fields of work can possibly be served by one organization,

and if this were attempted the result could be nothing but barrenness in both.

To obtain any real and lasting benefit to our profession we must be loyal to our association, the national character of which is something more than a name, for we could hold a meeting in most any state in the Union and muster a good showing of local members.

Our secretary has been giving us a large amount of his time and money and has spared no effort on our behalf. Is all this to go for nothing? Are we so blind to our own interests as not to realize the immense good that a strong association, devoted solely and entirely to ourselves, can do us? I cannot believe that we are. On the contrary, I am convinced that our members have every confidence in the possibilities which await us if we are firm in our allegiance to our association. Opposition should only have the effect of increasing our determination to make the N. A. G. the strongest society in the horticultural world, and so to shape its policy that it will stand for everything calculated to make us proud of ourselves and of each other.

We must as individuals spare no effort to increase our membership, for, although we are receiving accessions every day, there are still a large number in our profession who do not fully realize all we stand for. Our duty to ourselves is to bring all fit persons into the fold we pos-

The hall has been set rolling to obtain the co-operation of estate owners and I venture to think that we shall secure this in a measure greater than even the most sanguine of us expect. If this is desirable then we must work together for the general uplift of our profession, and above all things we must keep clear of entanglements likely to retard our efforts and which will only have the effect of putting sand into the bearings of our car which we intend driving up the hill of progress.

Let our motto consist of one word—Excelsior.

Read before the National Association of Gordeness et Reston Misser, August 19, 1914

### PROPAGATING THE DAHLIA.

As the dahlia is deservedly a popular flower, and as the newer types bid fair to surpass the older ones in popularity, a few cultural and descriptive remarks pertaining to the various groups will perhaps interest lovers of the plant, and elucidate many mistaken ideas which in practice are injurious, and are, therefore, detrimental to the production of flowers, writes H. J. Moore in Canadian Florist. Ignorance of the proper methods of propagation is a deterrent factor as growers, with few exceptions, recognize but one method, viz., by division of the tuberous root stock. Plants so raised are not so vigorous as those propagated by means of cuttings or seeds, as they deteriorate more quickly, and in the garden or on the show bench their flowers are inferior, a fact which is evident at a glance.

Plants of any rare or valuable kind may be increased by cuttings during August or September. By this method it is possible to multiply the stock and so preclude the possibility of losing it during winter storage, which often happens where but one or two tubers of each variety exist. The cuttings should be lateral growths from the stem, not those bearing flower buds, and be prepared in the usual way by cutting below a node (joint) and removing the leaves at the base. When prepared they should be inserted singly in two-inch pots, containing sand, mixed with leaf soil, finely sieved, or inserted directly in sand in the bench, and after rooting be potted into three inch pots. If placed in a cool shaded greenhouse they will quickly form "pot roots" (small tubers), and when the

these should be stored away until spring.

In the case of the general stock spring is the time to propagate. The old tubers may, during March, be removed from their storage and placed in a gentle heat of 60 to 65 degrees F., under the influence of which young growths will be produced. Any or all of those may be removed from the parent tuber, and as cuttings he inserted in the propagating bench, or in boxes filled with sand. Shaded from sunlight they will quickly root and after potting will, by the planting season, form sturdy plants. Propagation by division should not be tolerated where first-class flowers are required, or where the facilities of a small greenhouse or window conservatory allow of propagation by cuttings or seeds.

The dahlia is capricious in that it does not always reproduce itself true from seed. As by this means new varieties occur, this method of propagation is most fascinating, and merits a trial by the grower. Plants from seed sown in a greenhouse, in April or early May, develop rapidly, are equal in every way to those raised from cuttings, and if the practice were annually adopted by those whose storage facilities are not good, much worry would be precluded. There is, however, one objection to the method, there is no certainty that a desirable variety will reproduce itself, but the anticipation, as every plant gradually approaches the flowering stage and the pleasure, as they individually unfold their petals, more than compensates for the time spent on their culture.

The dahlia requires a moderately heavy soil, with plenty of humus. A very heavy soil is not conducive to success, as the succulent roots are naturally unable to penetrate hard, stony or clay soils. Heavy soils, however, may, by the addition of humus, be improved to such an extent as to render successful culture possible.

Do not plant out of doors until danger from frost is past. Old tubers which have not started into growth may be planted and escape injury as long as growth does not appear above ground. It is, however, best in all cases to start tubers, whether young or old, in boxes or in pots some weeks prior to planting.

While the methods of storing the tubers differ somewhat there are two conditions which are essential to success, viz., a fairly dry atmosphere, and an average temperature of 50 degrees F. in the storage room. As dahlia tubers are especially susceptible to the attacks of fungus, which cause them to rot, the atmosphere should not be humid, and being tropical in nature, the plants must have a certain heat even when dormant. Under ideal conditions it is unnecessary to cover the tubers when stored away, but if the atmosphere is excessively dry it is good practice to afford a light covering of dry leaves or straw to prevent evaporation of the moisture from their cells. Do not place the tubers on cold concrete floors, or on damp earth, a laver of boards will afford protection from these. Water should not be given during winter, as it either excites growth, or causes disease. All plants should be examined at least every month, and diseased ones be destroyed.

### OUR COVER ILLUSTRATION.

The illustration on our cover page, reproduced from a photograph of the Palace of Horticulture, was taken at a point 125 feet above the ground, the photographer being stationed on the huge Tower of Jewels, which is 135 feet in height. The Horticultural Palace is one of the most remarkable and beautiful structures upon the exposition grounds. The building is 600 feet long and 300 feet wide. The huge dome in the center is 186 feet high and 152 feet in diameter. The architecture of the domes and minarets resembles that of the mosque of the Sultan Ahmed I. at Constantinople, while the details of plants have finished their growth the pots containing the facades, spires and other decorations reproduce the Eighteenth Century French Renaissance.

### CULTIVATION OF ENGLISH WALNUT TREES.

By Hollister Sagt

Cultivation of the English wannut is not only one of the newest but one of the most rapidly growing industries in the United States; and of course the reason for this is readily traced to the fact that this country is producing only about one-half enough of these

nuts to supply the demand.

The Persian walnut, commonly called the English walnut, was named "Nut of the Gods," nineteen hundred years ago, by the Romans, and by them was distributed throughout southern Europe, where descendants of these original trees are now standing—some of them more than a thousand years old-lasting monuments to the men who conquered these countries. In many places these same trees are producing a large part of the total income; in truth, the United States alone is importing more than five million dollars' worth of nuts from these trees every year, and about half a million dollars' worth of their timber. English walnut timber is very valuable, having a handsome grain and being unusually heavy, so heavy, in fact, that the green wood will not float in water. The wood is used in the manufacture of gunstocks and furniture, having a greater value than mahogany. Single trees have been known to sell for more than \$3,000.

Realizing the importance of having a home supply of English walnut trees, France passed a law in 1720 prohibiting the exportation of the timber. How well advised was this move may be appreciated now when it is known that the United States is importing yearly from southern France a large percentage of our total consumption of 50,000,000 pounds of English walnuts.

The Romans did not neglect England; for as a result of their invasion, many of these fine trees, hundreds of years old, are scattered along the roads and drives in every part of the islands. Some are nearly a hundred feet high with a spread of more than a hundred feet and bearing thousands of nuts for their owners every year. One tree is reported to be more than a thousand years old and to produce more than 100,000 nuts a year, being a chief factor in the support of five families. In England, by the way, it is customary to eat the fresh nuts, after the removal of the outer skin, with wine, the two dainties being served together.

The Germans, also, were quick to discover the great intrinsic value to their country of these trees, and very early formed the habit of planting a young English walnut tree to take the place of one which for any reason had been cut down. The Germans were also said to have promulgated in certain localities a law which required every young farmer intent on marriage to show proof that he was the father of a stated num-

ber of English walnut trees.

It is believed the first English walnut tree in this country was planted by Roger Morris in 1758 at what is now known as Washington Heights, New York City. George Washington must have found that tree in 1776. Just one hundred years later, Norma Pomeroy, of Lockport, N. Y., father of E. C. Pomeroy of the English Walnut Farms, found a tree in Philadelphia, possibly a descendant of the original Morris tree. Mr. Pomeroy's tree was loaded with an exceptionally fine variety of sweet-flavored nuts, thin-shelled and with a very full meat. That very tree, with Mr. Pomeroy's help, was the progenitor of all the English walnut groves in western New York, as well as of the many fruitful and ornamental trees now growing in all parts of the North and East.

Experts say there is no good reason why this coun-

try should not raise, at least, enough English walnuts for our own needs, and even export a few million dollars' worth. We are now importing more dollars' worth of these nuts than both Canada and the United States are exporting in apples—and this, too, when Canada and the United States are known as apple countries.

California is producing about 12,000 tons a year. That State's crop last year would have been more than 13,000 tons had there not been three days of extremely hot weather about the middle of September, the thermometer registering 115 in many of the walnut sections. This torrid period seriously burned about 2,200 tons of nuts.

The California growers do not have the frosts to open the outer shucks which we have here in the East, but they overcome this drawback in a great measure by irrigating a few days before the nuts are ripe. They begin the harvest the last of September, gathering the nuts which have fallen, drying them in trays for a few days, then taking them to the Association packing houses, where they are bleached and sacked. The Association does the shipping and marketing, the grower gets his check on delivery at the warehouse. For there is no waste and the nuts are all sold before the harvest begins; in fact, often oversold.

In some of the old missions of California there are English walnut trees more than one hundred and forty years old, with trunks four feet in diameter. There are many of these individual ancient trees throughout the State, but the oldest of the orchards are from thirty-five to forty years. Some of these trees have a spread of eighty feet or more and the growers consider that an English walnut orchard will bear

profitably for at least two hundred years.

If trees will do this in irrigated sections, they will live and grow much longer in unirrigated places, for it is well known that the roots of trees not irrigated go much deeper into the sub-soil and get the moisture and nourishment which this sub-soil furnishes. The roots of irrigated trees remain nearer the surface and are not

so long lived.

As an ornamental tree the English walnut is unsurpassed. It has a light bark and dark green foliage which remains until late in the Fall, being shed with the nuts in October and never during the Summer. It is also an exceptionally clean tree and beautifully shaped, and so far as known, has never been preyed upon by the San Jose scale or any other insect pest. This freedom from scale is attributed to the peculiar alkali sap of the tree.

The demand for this nut is increasing rapidly, as its great food value is constantly becoming better known. Its meat contains many times more nutriment than

the same amount of beef steak.

The price is keeping pace with the demand, the growers now receiving three times as much for a pound of nuts as they got a few years ago, when they were producing only a tenth of the present output.

Thus it may be seen that the planting of English walnut trees not only is an exceedingly lucrative venture for the present generation, but it means the conferring of a priceless boon upon the generations to come. Some States are considering the advisability of planting these trees along the new State roads, after the custom in England and Germany, where practically all the walnuts are distributed along the drives or serve as ornamental shade trees upon the lawns. There is one avenue in Germany which is bordered on both sides for ten miles by enormous English walnut trees.

which meet in the center, thus forming a beautiful cov-

ered lane and at the same time yielding hundreds of dollars' worth of nuts each season.

It is the custom in England and Germany to lease the trees to companies which pay so much for the privilege of harvesting the nuts, thus attaching to the trees a value similar to that of gilt-edged bonds, yielding a steady income to the owners with no work involved.

Besides the demand for the English walnut as a table and confectionery delicacy, they are often used for pickles, catsup and preserves, and in France, many tons a year are made into oil, furnishing a splendid substitute for olive oil.

### EDGING MATERIAL FOR THE PLANT HOUSE.

As with the outdoor department so is it indoors, suitable and well kept edgings to stages and groups of ornamental plants add to their general effect and manifest the taste and care of the grower. A window box or hanging basket is a crude affair without its hanging material, similar to the conservatory or show house with elevated benches, that present a show of piping underneath and other unsightly obstacles. Cement too, is playing an important part where some ferns or other green material not fit for pot room could be planted out under benches. Loads of cement is used in many a small garden to make broad walks and clean yards where flowers and grass could be utilized just a trifle more.

Edging plants are like taking full advantage of the fuel, as the plants themselves are out of the way, hanging down the sides of the bench, writes A. V. Main. When May arrives it is generally the scarcest plant around, as it is wanted so much for baskets, verandahs and boxes. For indoor purposes it is hard to beat Panicum Variegatum, and it lasts longer than most of them. The various variegated forms of Tradescantia are worthy edging plants. Their use is preferable to a display of rusty pipes and rickety piers, supporting a fine show of orchids, begonias or cyclamen. The lovely Abutilon Megapotamicum, with beautiful green and mottled leaves, likes the stove temperature. Ficus Repens and F. Radicans and Ruellia Portellae are but a few of the plants that have a tendency to droop. These are all so easily rooted in four or three-inch pots that frequent renewals are but right to replace old material that gets shabby and root-bound twice over. Vincas, Japanese Honeysuckle, Campanula Isophylla, Ghechoma Hederacea Variegata and Lobelia come more into prominence and general utility for summer baskets and window boxes. In winter these hardy common trailers when used for decorating the fireplace, facing up bare palms, brightening up some corner in the mansion or conservatory, add a final touch to decorations.—Canadian Florist.

# EUPHORBIA (POINSETTIA) PULCHERRIMA.

For bright color the Poinsettia has no rival during the Christmas season, and when the weather is mild, as it has been this season, it may be used with advantage either cut or as a pot plant. For the latter purpose, however, it is not all growers who succeed in having plants with good foliage down to the pots. In many instances the plants are propagated too early in the season, and before the time of developing the bright red bracts they have become too tall and also have lost their foliage, or at least all of the lower leaves, leaving a length of bare stem. I like to commence to propa-

gate as soon as good strong cuttings can be obtained, and then take the tops from these later on. Strong tops taken any time during August will, with care, root freely; they must be kept quite close where there is a good bottom-heat. Either a hotbed or the stove propagating-pit will answer, but at the season when the fires are not kept up it is perhaps better to rely on a hotbed. Shading is essential until the cuttings have taken root, and I should mention that as the strong tops are hollow between the joints, they must be cut quite close below a joint. These late-struck plants should be kept in heat throughout, but must be as close to the glass as possible, and exposed to all the sunshine. As soon as the bracts are beginning to develop manure may be used freely. It is only where careful treatment can be given that these late cuttings succeed. Those propagated early may be grown in pits, or during the summer they may be placed in a sheltered, sunny position. They will show no sign of losing the foliage if left out until the nights get cold, but they will, when placed in heat, lose nearly all their leaves, and the bracts will not develop properly. As soon as they begin to show color the more heat and light that can be given the better, and after they are well developed they may be gradually hardened off. When cut they should have the base of the stem dipped in nearly boiling water, which will drive the sap up and prevent bleeding. Thus treated they will last in a room for several weeks, even longer than on the plants.

−Exchange.

### ENGLISH IVY AS A COVER PLANT

The advantages of the English Ivy as a cover plant have not been fully appreciated and when known it will be planted more.

Its freedom from insect pests together with the ease with which it can be grown will appeal to every one who wishes to grow something that does not require much care, and which always looks green. The shade of green is very restful to the eyes and with the clean foliage makes it very desirable.

For shady places and among trees, where it is so hard to get anything to grow without large amounts of water, the ivy is very satisfactory. In such places it makes a heavy mat of green, which is very useful on sloping ground where the soil is liable to wash.

On parkings to take the place of lawn, it fills a long felt need. Outside of an occasional watering, and trimming where the runners creep over the edge it

requires no attention.

The English Ivy does best in a moist shady place, but will grow anywhere if it gets enough water to give it a good start. Plants grow readily from cuttings, but it is better to get plants already rooted. After planting cover the ground with a thick cover of well rotted horse manure (care being taken not to cover the leaves) and then water thoroughly. If the mulch is thick enough watering once in ten days is sufficient, providing the soil is level. Where the ground slopes, dig a trench above each row of plants. Do this before planting, as the young plants must not be disturbed once they begin to grow. Do not cultivate around the young plants as it keeps the runners from taking root. The Ivy will take root any place it touches the ground. If these rootlets are continually broken off the runners become sunburned and hardened. Every place a runner takes root serves as a new means to gather food and moisture, so the plant is able to grow more rapidly. —The Pacific Gardon.

# WHAT BULBS TO PLANT.

Not every person who calls himself a botanist is interested in the cultivated pets of the gardener, but everyone ought to have more than a passing interest in the spring flowering bulbs which hint of the coming of a milder season long before the wild species of field and wood confirm the fact. Still earlier than the flowers comes the bulb catalogue; in fact, if the weather is good it should appear in the early autumn along with the crocuses which, impatient for spring, are so early as to appear late. It is not impatience but necessity, however, that actuates the bulb catalogue, for if spring-flowering bulbs are not planted in autumn there will be no spring flowers. The bulbs of this kind need the autumn and early winter in which to make roots and get things ready for an early start. The old bulb grower needs no instructions regarding the selection of bulbs but the novice may be glad to have a few hints at the beginning. To such it may be said that while all the different kinds of bulbs offered by the dealer will grow and bloom, there are some that are much better for the beginner than others because they yield their flowers with a minimum of attention on the part of the cultivator. The best bulbs to begin with, then, are the tulips and narcissi. Crocuses are cheap and make a fine show against a background of bare earth or withered leaves but they are not available for cutting and are easily run out by stronger plants. Hyacinths are fine when in bloom but they, too, are not very persistent and often fail to bloom properly. The tulip is always on the job. Its large and brilliant flowers light up the grounds as those of no other early flowering bulbs can do, and they serve admirably for bouquets indoors. Tulips may be had in all colors except blue, with flowers either single or double. If the plants are set in beds, one may have two entirely different crops of flowers from the same area by sowing the tulip beds, while yet the tulips are blooming, with seeds of petunia, portulaca, poppy or annual phlox, which will give brilliant masses of color all summer. The tulips may be left in the ground after they have died down, and the next spring will come up stronger and brighter than ever. In recent years a new race of late tulips, called Darwin tulips, have come into the market. These have stems a foot or more long with flowers of many delicate shades. They are as easily grown as the commoner sorts. The narcissi are fully equal to tulips as satisfactory garden flowers. They multiply rapidly and a single bulb soon develops into a clump. None of the narcissi are difficult to cultivate, though the single varieties will doubtless give greater satisfaction than the double ones. The poet's narcissus is a favorite with many, and the Emperor and Empress are magnificent varieties. Among smaller bulbs the glory of the snow (Chionodoxa gigantea) with fine clusters of lavenderblue flowers is well worth a trial, and a curious little plant from Syria, Puschkinia libanotica, with white and blue-striped flowers, will make an interesting addition to the bulb bed. Any catalogue will list many other kinds of bulbs, but the ones here mentioned are least likely to disappoint the beginner without previous experience to guide him. Though the bleeding heart (Dicentra spectabilis) is not a bulb, attention may be called to the fact that autumn is the proper time to set speciments of it in some sheltered corner. This plant is a spring blooming species, but its smaller relative, Dicentra eximia, will produce its small pink hearts throughout the summer. In planting bulbs, they should be set in a light, well drained soil in a spot where the spring sun will find them. It will be well, also, if they have some protection from the cold north winds of early spring, though this is not a necessity. During the winter the bulb bed should be covered several inches deep with dead leaves, coarse stable manure or other litter and this covering should not be removed in spring until the bulbs insist on pushing up through it.—The American Botanist.

### THE TREES.

They are gone! O! implacable City,
'Twixt a night and a night,
With no pang of regret or of pity,
You have slain them outright.

Though their beauty besought you to spare it,

To keep it forever and wear it

For your own and your children's delight, You have fattened your greed and your merit The squalor your streets shall inherit. In their innocent glory and grace, They, the primeval lords of the place, Ere your earliest highway was trod, Had grown old in the service of God; And with arms lifted up as in prayer, Gave Him thanks for the sunlight and air, For the nourishing moss at their feet, And the thrushes that made their retreat In the heart of this Eden so long, For their lodging gave tribute of song. E'en the violets, dotting the sward, Breathing perfume of prayer to the Lord, Paid in full for their leasehold; but you— In the service of Mammon, you grew To a huddle of houses and mills, Spreading squalor through hollows and hills, Till your grimy arms reached through your smoke To this grove of the Poplar and Oak. They are gone! O! implacable City, Twixt a night and a night, With no pang of regret or of pity,

### \$206,000,000 SPENT ON ROADS IN 1913.

Though their beauty besought you to spare it.

You have slain them outright,

In 1913 there was a total expenditure of State funds for roads of approximately \$38,750,000. The local road expenditures, if a 10 per cent, increase over 1912 is correct, would amount to \$151,250,000. In addition, there must be counted approximately \$15,000,000 as the value of statute labor in working out the road tax. This makes a total outlay for roads in 1913 of about \$206,000,000.

In 1904 the total expenditures for labor aggregated a little less than \$80,000,000, so that the present annual expenditure for roads is more than two and a half times

as great as it was nine years ago.

The fact that the States for 1914 have appropriated nearly \$43,000,000, or an increase of more than \$4,000,000 over the 1913 appropriation, and an increase of nearly \$13,000,000 over the 1912 State appropriation, indicates an increased interest in the State development of good roads. The mileage of roads built with the aid of State funds to the close of 1913 aggregated nearly 21,000 miles, or only about 2,000 miles less than the famous national road system of France.

It is interesting to note that there are now but nine States that set aside no State funds for road building, and there are only seven States which now have no State

highway law.

Automobile owners paid in licenses and fees in 1913, \$7,820,895, nearly all of which was applied to road work. This sum is about one-thirtieth of the total State and local expenditure for roads.

# Park Department Organization

By Frederick Law Olmstead.

There are three sound principles of administrative organization which need to be more strongly emphasized and more effectively enforced in many Park Departments. These principles are: (1) To fix clearly the duties and responsibilities of each agent; (2) to make it unmistakable to whom he is responsible for the satisfactory performance of his duties, and (3) to give him enough discretionary authority to develop his own sense of personal responsibility for getting the desired results.

These principles are, of course, truisms. No administrative organization which ignored them could do business at all, and I do not mean to suggest that they are not more or less generally recognized in the work of our park departments; but certainly they are not always applied with the thoroughness and consistency characteristic of a first-class organization. In many park managements, the difficult and somewhat chaotic conditions incident to the beginning of organization and construction have doubtless led to the adoption of emergency measures for getting necessary work done by any means available, regardless of the requirements for permanently efficient organization. What is now often greatly needed is a steady insistence on these principles all along the line from the commissioners down.

As regards the commission itself, I believe that the prime function and duty of a park commission, indeed the only adequate justification for the existence of a multiple commission instead of a single-headed park executive, is to provide that broader and sounder wisdom in regard to the large problems and general policies which is to be had from the united deliberation of several minds brought to bear from different points of view. As an executive, one man unhampered by fellow commissioners but provided with adequate assistants is undoubtedly more efficient than a commission of five men, and the only valid reason for not putting a park system under the charge of a single-headed executive is that there is serious danger of his doing, no matter how efficiently, some very unwise things. The purposes to be accomplished in park work are so difficult of definition. so varied in character, and sometimes so conflicting, as to be very debatable matters of judgment, in regard to which any one man's views are more likely to be mistaken than is the joint opinion of five men of equal or even of inferior ability.

I feel very strongly, therefore, that what a park commission chiefly exists for is the *joint* exercise of deliberate judgment, controlling in wise directions the executive activity of its employees; and that the individual activities of the commissioners should be directed, not to the doing of any chores which employees could be hired to do for them, but mainly toward equipping themselves, personally, in knowledge of the conditions and otherwise, for taking the most effective possible part in the joint deliberations of the board. It almost inevitably happens that each commissioner is most familiar with conditions affecting the parks in that part of the city where he lives. and such familiarity is a useful part of his equipment. But the natural tendency to regard each commissioner as a representative of his own district, in the sense of a special pleader for the interests as against those of the rest of the city, is most deplorable. And, even though the character of the commissioners be such as to prevent anything like log-rolling, there is grave danger in permitting each commissioner to specialize as an authority upon the parks of his own district. In so doing, he is apt to remain rather superficially informed about the other districts, and, when a matter comes up that does not affect his own district, he is disposed to waive his own personal judgment and courteously to accept without question the authoritative opinion of the commissioner representing the district particularly affected. This attitude vitiates the essential deliberative function of the board, and imperils the unified development of the park system as a whole.

These dangers are not in the least fanciful. I have seen the work of many park boards suffering severely as a result of them. I am convinced, therefore, that, so far as practicable, the division of committee work among the members of the board should be made not on the basis of locality, but of kind of work. There may well be a standing committee upon music and amusements; a committee on playground work, presumably including the subjects of bathing, neighborhood recreation buildings, and kindred social services. Other groups of functions which suggest themselves as appropriate for standing committees are: finance, accounting, and acquirements of land; buildings and engineering structures; grounds. Different functional groupings of the subject matter might fit the personal interests and capacities of the several members of a given commission better than the above, but the principle would remain the same, each committeeman gaining a familiarity with and a sense of responsibility for the entire park system, and being in a position to contribute authoritatively from his special point of view to the discussion of nearly every problem, regardless of locality.

Because the board needs all the time and energy which its members can spare for keeping itself thoroughly informed, and for reaching wise, deliberate, unhurried decisions upon questions of policy, no executive responsibilities ought to be placed upon the individual members

which can possibly be avoided.

Unpaid commissioners can hardly be expected to give enough time to the work of the board or to acquire sufficient training in technical details to make it fair to place upon them as individuals the entire and absolute personal responsibility for executing the decisions of the board, even though each be provided with competent paid assistants, and even though each be relieved of personal executive responsibility for those parts of the work assigned to other commissioners. Commissioners in charge of a city government occupy a different position in relation to that work from the normal position of unpaid park commissioners in respect to park work. The city commissioners are expected to give substantially their whole time to the work, they are paid for their services, and each of them is required not only to take part in the deliberations of the commission as a unified controlling body, but to assume personal responsibility. as the executive head of his own department, for the efficient performance in the minutest detail of every duty assigned to that department. It is, of course, possible to organize the work of a park commission on the same theory; but my experience leads me to believe that it is seldom expedient, not only because it makes an unfair demand upon officers who are asked to serve without any pay, and is therefore likely to break down in practice and result in more or less shirking of duties and inefficiency, but still more because the pressure of executive routine and of personal responsibility for innumerable details makes it exceedingly difficult for a park commissioner who is subjected to such pressure to find the leisure and the detachment which is necessary for reaching wise conclusions upon the larger questions of park policy, and upon the general trend of results of the various operations of the department.

The peculiar difficulty in defining and keeping clearly in view the controlling purposes to be served by the various park areas, and the enormously large percentage of waste which is apt to occur in park work (without arousing general notice) through vacillation of purpose and through failure to keep any one consistent aim clearly in view from year to year in expending moneys for the maintenance and improvement of each piece of park land, make the above considerations more strongly applicable in park work than in most other departments of city government. In no other class of municipal work, I believe, is it so important that the commissioners in charge should free themselves to the utmost possible degree from the worry and tedium of executive detail, should place upon their subordinates the burden of settling the innumerable petty questions that arise from week to week, so as to be able to concentrate their own attention upon the larger aspects and tendencies of the work. In no other class of work is it so important that the board should act as a really unified deliberative body, and not as so many separate individual executives.

If this is not done attractive ideas for improvements and for changes in maintenance methods, whether originating with individual commissioners, or with employees, or whether urged upon the commission by outsiders, will be too easily adopted on their face value without sufficiently deliberate consideration of their relation to other ideas, and to the probable net results during the next twenty or thirty years or more. Important questions will be too frequently settled at the eleventh hour, under duress as it were, instead of being anticipated and settled right, because settled after mature delibera-

In other words, proposals which in essence involve changes of policy, changes in the plan of given park areas. changes in the kind of use to which given areas are devoted, and for which they may have been gradually perfected by laborious and costly maintenance work extending over many years, changes in the *character* of park areas which may involve greatly increased burdens of future maintenance cost—such proposals are too often authorized and put into effect at the instance of individuals without deliberate study of the probable consequences by the members of the board as a whole: while, on the other hand, the time and energies of the commissioners are too often occupied in settling details of method, for which the board's employees ought to be held responsible.

Of course, the commissioners must keep themselves informed as to the methods used by their employees, both for the purpose of judging whether the employees are really directing their energies toward the ends approved by the board and for the purpose of judging their efficiency. But keeping in close touch with the methods of an employee is one thing, and doing his work for him, or tying his hands by detailed orders, is another.

It is an excellent general rule that a commissioner is not to give orders to foremen and other subordinates except through the superintendent. To do otherwise is obviously subversive to discipline. But this rule ought to be carried a step further, and no member of the board should, as an individual, give orders even to the superintendent. Every member should be at liberty-indeed it should be his duty, especially in regard to the subject matter of his standing committee—to put to any employee suggestive questions calculated to bring out the reason or

the lack of reason for any course of action about the expediency of which there is any doubt; but it should always be made clear that the responsibility for accepting or rejecting any such suggestion rests entirely upon the personal judgment of the executive employee, within the limits of discretion allowed to him by his immediate superior; and it should be made clear also that the immediate superior of the general superintendent is not any one of the members who may choose to give him orders, but the board as a whole. Thus no one could weaken the absolute responsibility of the superintendent for getting the best possible results within the limitations fixed upon him by the votes of the board. He would have every benefit of the best counsel and advice which each member of the board could give him; but in taking such advice he would do so on his own responsibility, unless specifically directed by a vote of the board, and he could hide behind no one else's skirts if the entire results were

not just what he thought they ought to be.

Theoretically at least, the entire executive business should be carried on under a single responsible head, through whom all employees would be responsible to the board, and through whom they would receive their orders. It is of secondary consequence whether this administrative head bears the name and has the special technical equipment of a park superintendent or a secretary, or otherwise. In particular cases, there may be personal reasons which make it inexpedient to place all the executive employees under any one of their number as chief; but I hardly think an organization can be said to be in the best of shape without any recognized chief executive at all. In some cities it is necessary for the chairman of the board to act in this capacity. Sometimes the office of chief executive is made a nearly colorless means of transmitting instructions and reports between the board and its various executive employees, in which case there are obvious advantages in assigning the duty, along with other central clerical work, to the secretary. But commonly the superintendent is the most effective general executive. As such, it would be his duty to throw upon the head of each division under him as much of the entire discretion and responsibility and labor connected with the duties of that division as each could be made to carry with reasonable success. In his dealings with each of these divisions, he would constantly have the special counsel and supervision of a standing committee of the board. As previously stated, such a committee should not be empowered to issue orders, because to do so would weaken the responsibility of the general executive for the harmonious working of all the divisions, and also the responsibility delegated to each of the heads of divisions and through him to his subordinates; but whenever any committee felt it to be important that certain orders be issued and its suggestions to that effect were not accepted by the responsible executive officer, the committee would take the matter before the board, which would as a whole consider the wisdom of overruling the executive officer, and in so far curtailing his discretion and his responsibility for the results of the work.

Taking up now the question of fixing the limits of responsibility and of authority for the various parts of the executive force, I suppose the only lines of division which can be defined in such a manner as to preclude conflict through overlapping jurisdiction, and at the same time ensure that nothing shall fall between two divisions and thus escape from the responsibility of everyone, are territorial lines.

The lines separating one district from another can be defined beyond the possibility of doubt, and if the person in charge of each district is made responsible for everything and anything affecting the successful and economical

(Continued on page 186)

# Notes By the Way

By Wm. H. Waite.

Through the courtesy of my friend Mr. J. Brock, I spent a very pleasant afternoon recently visiting the estate of E. T. Bedford, Greens Farms, Conn., over which Mr. Brock presides as superintendent, and, having my camera along, I was allowed the privilege of making a few pictures, three of which, I think, might interest some of the readers of the Chronicle.

This magnificent estate is comparatively new, and is, I think, the best kept that I have ever had the pleasure of seeing. The photos will give an idea of the character of the place.

are few but large are filled solidly with Begonias Luminosa and Erfordi, and at the time of my visit made a most brilliant display. A fine boxwood hedge surrounds this garden and the dwarf box is used for edging the beds, while the banks are clothed with English ivy. In the centre of each half of this garden are beautiful beds of the choicest evergreens splendidly arranged and remarkable in coloring and growth to be so near the sea.

Photo No. 3 is a view taken from the public road, looking down on the herbaceous garden. This is a

HOME OF E. T. BEDFORD, ON HIS MAGNIFICENT ESTATE, GREEN FARMS, CONN.

Photo, No. 1 shows the house, with its handsome bay trees and with the sunken garden in front. The house is located only a few hundred feet from the Long Island Sound.

Photo No. 2 shows part of sunken garden; this is indeed a very pretty feature; the flower beds which

splendid exhibit of perennials harmoniously grouped, the building on the top of the hill being the garage, and superintendent's house. There are many features in this garden that are not noticeable in the picture, for this was taken as a bird's-eye view. A charming lily pool with the best varieties of aquatics is near the

SUNKEN GARDENS, E. T. BEDFORD ESTATE, SHOWING BEDS OF BEGONIAS AND EVERGREENS.

center. This pool is banked with Japanese iris, thousands of hardy lilies and other suitable plants. A miniature avenue, lined with standard geraniums, was another unusual feature. In this garden we noticed large masses of all of the best hardy plants available, the idea being to keep as fine a show as possible throughout the whole season.

Leading from the herbaceous garden to the greenhouses, we go through a spacious rose garden with a long pergola covered with all the best climbers. The range of glass is very compact and neat, and the stock was in fine shape; a house of melons being particularly fine. Around the greenhouses are large blocks near them and take note of the changing day. They seem to know every tiny sign of the varying seasons. All these things point to close observation, and must mean pleasure in the surroundings; for most people do thoroughly enjoy what they observe or study carefully. The discontent with any form of work is half knowledge or worse, a slatternly habit of thought about it. The country life has opportunities which many city people long for and which make the success of the famous naturalist. It is a limited existence only to the limited man or woman who neglects to take opportunity by both hands and find beauty and blessing.

— Exchange.

VIEW OF HERBACEOUS GARDENS, FROM THE PUBLIC ROAD E. T. BEDFORD ESTATE GARAGE IN THE DISTANCE.

of flowers such as Asters, Dahlias, Gladioli Antirrhinium, etc., grown for cut flower purposes. Here I saw the finest show of Antirrhinium that I have ever seen in this country.

After viewing the horticultural department, Mr. Brock took us in his car over the farm, over which he also presides. Here we found everything in splendid shape. The dairy is a modern building, most up-to-date in every detail. Everything on the estate is of the highest quality, and the splendid condition found everywhere on it reflects the highest credit on the able superintendent, Mr. J. Brock.

#### OPPORTUNITY IN THE COUNTRY.

Published among the alleged jokes in a recent magazine the reply of a farmer to his city boarder has more poetry than humor in it. The guest asked if the farm were not lonely in winter. The host, sweeping his hand abroad over the hills and valleys of New Hampshire, said in astonishment, "Lonesome? No! Why, on a clear day we can see Mount Washington." There is a popular belief that those who live in the daily presence of scenes like this grow indifferent to them, or perhaps have never felt the companionship of woods and mountains. But actual experience often brings one in contact with country dwellers who understand and love the beauty around them, though they may not be always ready to put their feeling about it into words. Farmers know the splendid points of view

#### GIVE OLD MOTHER NATURE A CHANCE.

Escape from the shop for a little,
No matter just where it may be.
Go out in the green woods and whittle
Or wander along by the sea.
Fly forth from the turbulent city
And all of its clangerous ills,
And list to the jovial ditty
Or birds on the burgeoning hills.

No matter how much you enjoy it,
Drop work for a moment and dance.
Go out for a little and "boy it"—
Give Old Mother Nature a Chance.
Be noisy and fresh, and be jolly;
Build castles of nothing but air;
Drop worry and blank melancholy—
Escape from vexation and care.

Go lie on the grass and just holler;
Go laze by the babbling streams.
Forget there's a thing called the dollar,
And live in your visions and dreams.
Like mist of the night, like a bubble,
Will vanish unquiet and fear;
And out of the sea of your trouble
Will rise the warm sunlight and cheer.
—John Keedrich Care.

SEPTEMBER, 1914.

No. 5.

The incomparable opportunity which now confronts the American business man, in almost every line of effort. should act as a tremendous stimulant to our national prosperity, says Col. George Pope, president of the National Association of Manufacturers, the most important body of its kind in the United States, in the New York Times.

There are the markets which Europe has supplied and there is the market in Europe itself left vacant by the withdrawal from industry of millions of men and billions of capital. If we accept the gift of fate we can be prosperous beyond our dreams. Why not welcome it instead of fearing shadows? he asks.

The first thing to be done must be the mission of the press, lay and technical, to call the attention of the public to the fact that the United States is the only nation in the world today which has no excuse for business pessimism.

We must become optimists at a time when everything justifies it. We must do away with public worry. There is no excuse for it. We have been frightened by the other fellow's peril. That is not good judgment. It is the worst of judgment.

The alleged excuses for it are hard to discover and difficult of definition, says Col. Pope. They may be summed up in the words, poor business. That is, the public are not buying goods. With a public afraid to buy the merchant is afraid to lay in stocks, and the manufacturer is afraid to manufacture goods. Each one of these fears results in unemployment and thus unfortunately tends to transform the imaginary into fact.

No general depression can exist as the result of a disturbance local to one section or one line of activity. No unfavorable conditions which are general in any industry can fail to react in some measure upon other industries. Nothing is more contagious than doubt, nothing is so

enervating as fear.

We must be careful to be cheerful and hopeful if we want to be happy, and our own happiness will react upon unfavorable surroundings, tending to make them favorable. In other words, happiness will beget cause for happiness, and this is truer in business than in anything else.

Only when we are happy do we feel like spending money upon ourselves and families; only when we are happy does our happiness react on other people and make them feel like spending money. And unhappiness is a tremendous bar to man's efficiency in earning money. When we are not nationally happy we are not nationally prosperous, for we are not doin business one with another.

We are confronted with the certainty of a tremendously enlarged and highly profitable European trade, Asiatic trade is beckoning to us, there is every logical reason why we should assume control of South American trade. In the meantime, at home we have a year of bumper crops, we are the one great nation of the world not involved in the great war.

For us at this moment, when we are logically called upon to put forth our best efforts, and when we can gain much from so doing, to hang back, sulking and frightened by a bugaboo conjured up in our own imaginations and not elsewhere existent, would be for us to commit a national foolishness of unprecedented proportions and seriousness.

At the summer meeting of the National Association of Gardeners, held in Boston, August 19, 1914, a committee was appointed to draft a resolution conveying the sympathies of the members of the organization to the European horticulturists on the terrible calamity which has befallen them.

The committee reports its resolution as follows:

"Whereas, Our fellowmen engaged in the pursuit of horticulture in its various phases in the European countries are now surrounded by the horrors of a terrible war, many of whom may be suffering from sorrowing anguish for loss of kin on the battlefields.

"Be it Resolved, That the members of the National Association of Gardeners convey to their brother horticulturists in Europe afflicted by the war, their heartfelt sympathies on the catastrophe which has so suddenly overtaken them; and that our prayer be that the Almighty God in His infinite wisdom will guide the instigators of the appalling conflict now raging to a speedy termina-

tion of it and to everlasting peace.
"Be it Further Resolved, That copies of these resolutions be forwarded to the various national horticultural bodies in the several countries now at war, and spread on the records of the National Association of Gardeners."

#### OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### PROCEEDINGS OF MIDSUMMER MEETING NATIONAL ASSOCIATION OF GARDENERS.

The mid-unaner meeting of the National Association of Gar deners was held in Paul Revere Hall, Mechanics Building, Boston. Mass., at 1 o'clock p. m. Wednesday, August 19, 1914, under the presidency of G. W. Waite, Yonkers, N. Y., Martin C. Ebel, Madi son, N. J., officiating as Secretary.

Mr. William Kennedy, of Boston, Mass., 're ident of the Gardeners' and Flor'sts' Club of Boston, eally, the meeting to order

and addressed the convention as follows:

#### Address by William Kennedy, President, Gardeners' and Plevists' Club, Boston, Mass.

Gentlemen of the National Association of Gardeners: We well come you to the city or Boston in behalf of the Gardeners' and Florists' Club. I sincerely trust, gentlemen, that your visit today, and for the next few days that you are here, will be both educational and instructive to you in your line of business

Great stress has been laid on the fact that the so-called Canvention Garden in the Back Bay Fens has been put there by the Society of American Florists and Ornamental Horticulturists. Gentlemen, I assure you that without the co-operation of the gardeners who planted that stuff, the Convention Garden and I speak knowingly, as I am one of the Executive Committee of the Boston Horticultural interests-would not be the success that it is today. It is true that the trade send their goods there to be planted, but they send no instructions how they should be planted or where they should be planted, but simply to plant them. With the able assistance of one of the best gardeners in this country, Mr. Trenneth Finlayson, that garden today is what we term, or what you might term, a success, inasmuch as it looks well from the gardener's standpoint; but I have no doubt but that all of you might go through there and improve the Convention Garden. This, of course, could not be said anywhere else. The general impression of the public in Boston today is that the garden is a beautiful piece of work. It is for the time that the committee had to do it in. There is no use of anyone criticising at this time the work of the gardener.

Gentlemen, the thought has often occurred to me as to how long the National Association of Gardeners is going to be a parasite of the Society of American Florists. The time has come, gentlemen, when we have got to break away from these kindred bodies and hold conventions of our own. There is absolutely no reason why the gardeners of this country cannot get together and have just as interesting if not more interesting conventions than the Society of American Florists. There are thousands of thousands of gardeners that would be only too pleased to build up this organization if we could get them in through the distribution of some proper literature whereby we could induce them to become members, and in that way we could get delegations from different States so that we would be able to run a convention equal to if not better than those of the S. A. F. It is pretty nearly time. gentlemen, that something should be done along that line. intelligence of this body is superior to the intelligence of any body connected with this business. It is true that the Society of American Florists takes in the gardeners inasmuch as they add to the membership of the S. A. F. For the past six months in Boston the matter of affiliation has been up, the question was whether or not you were going to try affliation.

There is no need of affiliation. As far as affiliation goes the two departments of the business, to my mind, are separate. One grows flowers commercially in order to make a living; the other grows flowers to please his ladyship, or the man he works for. The gardener takes care of a large estate, and he buys from the members of the so-called Society of American Florists, and he

sells nothing; he has nothing to sell.

It is not my intention, gentlemen, to keep you very long this afternoon. I know you have a business meeting to carry on, and you have other things to attend to, and it is not the desire of the Gardeners' and Florists' Club of the City of Boston and the kindred interests to interfere with the regular conduct of your meeting; so I now take great pleasure in introducing your President, Mr. Waite.

President Waite addressed the meeting as follows:

#### Opening Remarks by President Waite.

Mr. Kennedy and Gentlemen: I am very much indebted to Mr. Kennedy for his very kind remarks. I am pleased to see so many

here. Very important business can be transacted even without large numbers present, but I am much pleased that so many have turned out.

Mr. Kennedy is a little at tault in implying that we have never had a convention, ior is you all know we have held several conventions entirely apart from the S. A. F., and wholly under

our own responsibility.

We had a very successful convention last year in November in New York, and the Executive Board this morning passed a resolution to hold the next convention at Philadelphia in Decem-This convention will be under our own auspices entirely without any connection with the S. A. F. or anyone else. The convention this year will last for two days, and Mr. Logan promises us a very good time in Philadelphia.

I hope the convention there will be largely attended. I hope to see as many of the New England, and particularly the Massa-

chusetts, men as we can get.

I have great pleasure in presenting to you a man who has come all the way from California to attend this meeting Mr. Daniel MacRoric. Applarse.)

#### Remarks by Daniel MacRorie, of San Francisco, Cal.

Mr. President and Members of the National Association of Gardeners: The Panama Pacific and International Exposition of San Francisco, Cal., sends you its greetings and invites you to convene in San Francisco in 1915, when we celebrate the opening of the great canal. We have a number of things to show you out there that will interest and entertain you, especially along horticultural lines and agricultural lines, such as our big trees and the great agricultural pursuits of that State. I will say that Pacific Coast Horticultural Society will be glad to have you come there next season. We hope you will all come. We will give you all a good time, and there is no doubt but that we will add at least fitty people to your ranks. I thank you, gentlemen. (Applause.)

MR. W. N. CRAIG, Brookline, Mass.: I think it is but due Mr. MacRorie that we take this action, and I move that the National Association of Gardeners hold its 1915 mid-summer

meeting in San Francisco next year.

Motion seconded by Mr. Ebel, carried and so ordered.

MR. MACRORIE: We have a fine lot of gardens out there and

a fine lot of fellows

PRESIDENT WAITE: Mr. Aithur Smith, of Reading, Pa., was to be here this afternoon to read a paper. He sends a letter expressing his regret at his inability to attend the convention to which he has been looking forward with pleasure. He encloses a copy of his address, and trusts that the convention will have a good attendance and an increased membership. If it is the wish of the meeting, while we await the arrival of some of the other gentlemen who are to address us, Mr. Ebel will kindly read this paper. Is it the wish of the meeting that this paper be

There being no objection, it was so ordered, and Secretary Ebel read the paper by Mr. Arthur Smith on the subject of "The Profession of Gardening." (This paper is printed in full elsewhere in the columns of THE CHRONICLE.)

PRESIDENT WAITE: You have heard this very interesting paper by Mr. Arthur Smith. We will be glad to hear any remarks that any of the members may have to offer.

MR. THOMAS W. LOGAN, Jenkentown, Pa.: I move that this very able paper be received and that a vote of thanks be tendered Mr. Smith.

Motion carried and so ordered.

PRESIDENT WAITE: I think that Mr. Ebel also deserves a vote of thanks for reading the paper. It was rather serious work. SECRETARY EBEL: We will pass that up. That is the Secretary's duty.

Mr. Theodore Wirth, President of the S. A. F. & O. H., now came into the hall and was introduced by President Waite.

President Wirth was received with applause.

MR. W. N. CRAIG, Brookline, Mass.: At the present time, and as we are all aware, the nations of Europe, or at least most of them, are waging a tremendous war which cannot but have a disastrous effect upon horticultural interests there. I have a resolution drawn up which I wished to present here this afternoon, but I unfortunately left it at home. It was worded in substance as follows:

Resolved, That we, National Association of Gardeners, convey to the national horticultural bodies of Europe our good wishes. good cheer and our sympathy in the present distressful times. I move that a committee of three be appointed to draw up a resolution along those lines and forward it to the several horticultural societies on the other side.

The motion was seconded with applause and duly carried.

PRESIDENT WAITE: I will appoint as that committee W. N. Craig, Brookline, Mass.; Duncan Finlayson, Brookline, Mass., and Martin C. Ebel, Madison, N. J.

President Theodore Wirth, of the Society of American Florasts, will favor us with a few words.

### Address by Theodore Wirth, Minneapolis, Minn., President of the S. A. F. & O. H.

Mr. President, Fellow Members of the National Association of Gardeners: I want to tell you that I am exceedingly glad indeed to be with you. You are, so to speak, an Eastern association, because you have very few members, if I am not mistaken, out in the West; but in that you are somewhat in the very same position with the American Society of Florists and Ornamental Horticulturists, although the latter society is of thirty years standing. So I want to tell you that that you need not feel discouraged that you have not very many members yet in the Far West. You all understand that the Far West is away behind, in a good many respects, the Far East. It is a newer country. the West you have to travel hundreds of miles before you find a private estate which would anywhere near compare with such estates as we find right around here near Boston, or elsewhere in the New England States. But that simply means that the time is coming when there will be a great opportunity for we gardeners to help to build up that great Western country; and I want to tell you, my friends from the East, that if you get too crowded out here, do not hesitate to come out West. You may not find places all laid out for you, but you will have the pleasure and the privilege of laying them out. I have not listened to any great part of the paper written by Mr. Smith, but from some discussion that I have noticed in the trade papers and a few remarks that I have listened to, I believe I know what the gentleman had to say to you; and I want to say that I believe I know-and I talk from experience-that if the gardener of today is underpaid, and if his labors, his knowledge and his experience are not appreciated, it is to a certain extent at least the fault of the gardener himself.

I want to tell you that the Far West offers a fine opportunity for the gardener to go out there and build up places and make a demand for positions for good gardeners to fill.

Now the National Association of Gardeners, I think, should make it a point to help gardeners out all it can; but it should not try to help a man that cannot help himself. A man must be able to help himself. If he can help himself, the Lord will help him, there is no question about it. (Applause.)

Some twenty years ago I was what they called a greenhorn in this country. I am glad that I was a greenhorn, and that I was brought up on the other side, and had to serve a good hard apprenticeship. And what is more, I had to work for three years for nothing, and my father had to pay for my board. I have always been glad that I had that hard work to do when I first

decided to become a gardener.

I came over to this country, and I was directed to go out to Long Island some place—I will not mention the place. I have told this little story once before in Boston. It was one of the finest places in Long Island at that time. I went out to the gentleman on Saturday afternoon, and we walked around the place all afternoon. I was delighted with the work that had to be done there. When we got all through the gentleman was ready to go back to town, and he asked his head man or manager there to show me my room. He took me up above the horse barn to a little bit of a room with a window in it not any bigger than that ventilator over there—no light. no air, no anything. I said, "What is this?" The manager said, "That is your room." I said, "You go and tell the gentleman that unless I get a decent room to live in I will go right back to town and stay there;" and the gentleman said to his manager, "Give him the best room you have in the house and I will pay for it." that gentleman thought much more of me because of the stand that I took than if I had submitted to that kind of treatment. All you have to do, my brothers, in your business is to stand by your guns. If you demand proper recognition, you will get it. As long as you submit to everything you will not get it. There is nobody to blame but yourself.

And now I want to say a few words in regard to the S. A. F. You know that the S. A. F. is a commercial organization. It is the strongest organization that we have today in the States; and I am personally of opinion that we ought to branch out to a great extent in the work that we are doing; but I do not believe that the majority of the members see it that way. When you have a horticultural society that you can make use of, which has existed for thirty years, has a national charter, and is recognized all over the country as a progressive association, I would like to see that association made use of by every branch of

horticulture.

I believe that affiliation ought to be brought about, not necessarily by a large membership, but by giving every organization that is progressive and has a good active membership representation on the Board of Directors of the S. A. F. Each of the affiliating organizations can through its membership on the Board of Directors express its own views and obtain recognition for whatever objects it has in view. So I hope that your Association will take this matter under careful consideration and send a director to our S. A. F. Board of Directors in due time.

I do not want to make use of my present position as President of the S. A. F. & O. H. to try and unduly influence you here; yet I ask this of you, that you learn what we are trying to accomplish and whether you can see your way clear to help us to accomplish what I have in mind, namely, a national association ultimately which will represent and minister to the needs of every branch of horticulture. If you can help us to bring that about, then I will feel that I have been amply recompensed for my appearance and efforts before you here today.

Now, gentlemen. I do not want to take up any more of your time. I thank you very kindly for listening to me so long.

(Applause.)

#### Response by Secretary Martin C. Ebel, Madison, N. J.

Mr. President and Fellow Members: I want to say a few words in answer to President Wirth, of the S. A. F., who is also a director of the National Association of Gardeners.

would suggest to him that when he goes back to his home in the West he will not forget that in the National Association of Gardeners we have competent men who are willing to go West if the opportunity offers. I believe that the estate owners are willing to pay fair prices, but they have not yet been fully educated up to it, and many do not know the difference between a garden laborer and a gardener. In the National Association of Gardeners' Service Bureau we have had three instances recently where estate owners have called for men for \$75 or \$80 a month. In each case we refused to recommend a man unless they would pay \$100. And they replied, "Find the man such as you describe and I will be glad to pay such a man \$100, but I have never come across such a man." The men that were recommended by the Service Bureau, I am glad to say, are all giving satisfaction, and one has already had his pay increased. The great difficulty is that when a position is in the market and gardeners find out about it, their applications pile in and they compete with each other, offering their services for a low price in order to get the position. There was an instance in New York this year where a man had been engaged on the recommendation of a landscape architect to take charge of a large estate. The owner offered the applicant \$125. He would not accept less than \$150, and was engaged at that figure. The vacancy about that time became noised about, and within three days there were 65 applications, none of them asking higher than \$75. One man wrote that if he could get "the job" he would be willing to take it at \$40 per month, and show the owner how he could make some money out of his place. Then the owner went to the landscape man and asked, "Don't you think I am paying too much; don't you think I can get gardeners at a lower price than you thought I could?" And so the trouble often rests with the gardeners themselves. They compete with one another.

I want to say to Mr. Wirth that we are going to San Francisco next year, and that we are spreading out. I move that we tender a rising vote of thanks to Mr. Wirth for his address to us

this afternoon

Without waiting to have the question put to vote, the entire meeting rose and greeted Mr. Wirth with applause.

MR. WIRTH: I want to thank you gentlemen, and I want to say just one more word, and that is this, that I am very glad to hear that you are coming to San Francisco. The S. A. F. voted to go there. The election was carried by one vote. I believe we could have gotten more votes if we had wanted to. If you people want to get acquainted with the florists it is absolutely necessary for you to go there. The S. A. F. calls itself a national association. If we are a national association we will have to try and cover the entire country. In the same way, you call yourselves a national association, and if you are going to call yourselves national, you will have to go all over the country. I am very glad that you as a very young organization have the courage to do what an association of thirty years standing seems to have been a little timid about doing. (Applause.)

have been a little timid about doing. (Applause.)
PRESIDENT WAITE: Professor E. A. White, of Cornell, has just entered the room. He will have a few words to say to the

boys present here.

#### Remarks by Professor E. A. White.

Mr. President and Gentlemen: I did not expect to say anything, having just come in here a moment ago. I wanted to know what was going on. I asked of Mr. Ebel what I should say, and he said, "Just give us a few words of good cheer." I presume that you know that I am located at Cornell, and that we are trying to do something in the way of promoting horticultural

interests there, and more especially in my line of floriculture. We are trying to give our gardeners as well as florists there an all-round education. We lay out our course so that we can include a course in professional floriculture. We also aim to give a good training in garden flowers and general plant work. need the help of not only the New York men, but of all the men interested in the gardening profession, so that we can build up as we plan to do there at Cornell the strongest course in floriculture and gardening given anywhere in the country.

I said that I had not expected to say anything; but I am very glad to extend the greetings of New York State, and especially of Cornell University, to the National Association of Gardeners.

MR. JOHN YOUNG, Secretary of the S. A. F. & O. H., next read an essay by Mr. Arthur E. Thatcher on the subject of "What Should the Society of American Florists Do for the Private Gar-

Reverting directly to the gardener, Mr. Thatcher writes:

Although we are at the moment chiefly concerned with what the S. A. F. can do for the private gardener, we might also for a moment see what the society has done for him. no doubt that the exhibitions held by the S. A. F. in various parts of the country during the last few years have been the finest the country has ever seen; and these have been produced by the cooperation of the commercial and private growers. How much ther they could have been had the private gardeners been more enthusiastic can only be imagined. Certain it is that they have been of great educational value, and are yearly growing more so. Cannot the private gardener learn much from them?

Our president, though he may be the foremost park superintendent in the country, will not be offended if I class him as a private gardener. What shall we say of the rose garden he has constructed at Hartford? Is it not the finest example of its kind in the world? And what of the out-door garden he made at Minneapolis? Are such things not of the highest educational value, and calculated to be of the greatest assistance to the private gardener, if he will only profit by them? . . . It may seem strange to some, but it is nevertheless true, that some of the men who have been most prominent in the society's affairs are, or have been, private gardeners. I have only to mention such names as Farquhar, Roland, Fisher or Totty, who are well able to tell us what advantages have accrued to them by their association with this society. No one will imagine for a minute that the society has made them what they are today. This has been accomplished entirely by their own efforts; and I believe this is the crux of the whole question regarding the private gardener. For the society to be of use to him he must endeavor to become an important factor in the society. .

I cannot help thinking that the question of helping the private gardener very largely depends upon the private gardener himself; and to be of any assistance to him, any small feeling which may exist must be forgotten so that we may all, commercial and private gardeners alike, pull together for the common good. It seems to me this powerful organization is fully equipped and fully capable of looking after all classes of the profession if we all work harmoniously together. Can we not do this and help forward the good work of this society and the grand old profes-

sion of horticulture?

PRESIDENT WAITE: Gentlemen, we will now throw the meeting open to general discussion.

The papers by Mr. Smith and Mr. Thatcher were now thrown

open for discussion.

MR. JOHN BURNS, New Canaan, Conn.: In my opinion the future gardener is the one that starts at the stoke-hole and climbs up for eight or nine years in a first-class place under a

first-class man, and then takes a course in college.

MR. WIRTH: I think that is a very good point. That brings out something that I am very glad to have you bring out, because it involves the question of what benefit colleges are to us, how do they help us? I believe that the good they are doing is underestimated. My personal belief is that if a man could serve an apprenticeship the way one has to serve in the old country, when he arrives at the age of 20 or 21 he will begin to realize that education will help him; and if then he goes to college he will get practice and theory properly combined. I have three boys, and they all hate to go to school. They like to be out in the open. I let them go now, but when they get to be 20 or 21 they will realize that they have to have education, and they will be glad to go to school and get the advantage of school training.

MR. BURNS: The reason that I placed practical experience before the college is that if they go to college first when they get through going to college they do not feel like settling down to shoveling coal. They do not feel like going out and taking care of frames; they do not feel like shoveling cow manure, if you please; but let them get the hard work first, and then take a little course in college. Then they will have both experience and theory. In fifteen years from now there will be a lot of college fellows coming out, and those fellows will be stepping

into our shoes.

MR. WILLIAM DOWNS, Chestnut Hill, Mass.: I believe that that is quite true and that the speaker's point is well taken; but I do not think that that is the American spirit as I have seen it in the last twenty years. We shall not always get our gardeners from across the water, and I think there is no question but college men will enter into the profession. My employer is a college man, and he invariably brings that up. But we have had more than one sad experience with college men. He says that we want a college man provided he is a good man, but if he is not a good man the college man is all the worse for being a college man. Now, you will find it very difficult to find a man that has gone through the stoke-hole and the rest of it making up his mind to spending two or three years in college. That is not the American spirit. The American spirit is to "get there" without any apprenticeship, and we must give them credit that they do "get there," not only in our profession but among all workmen. They do not make the finished workmen that the old country apprenticeship system does, but they "get there" just the same. And it is that spirit that we have to look to. We are living under the Stars and Stripes, and no matter where we were born we have got to "get there."

The average young man after he has been in the stoke-hole for 7 or 8 years wants to be superintendent. The average greenhouse man that we get today from the other side who takes an interest in the green-house stays right there; he will not go across the lawn to see what is going on. I had a job two or three years ago where a very difficult piece of work was being accomplished not more than 200 or 300 feet from my green-house. I said to my men, "Have you seen what they are doing there?" They said they had not. Now, that is the kind of men that are going out to fill positions. We have had to put up a lot of buildings since I have been on the place, and my men knew nothing more about building after the building was done than they did before it started. That is the trouble with the average gardener. He does not look out for himself. He takes no interest in what is going on around him. If you want to advance you must get knowledge; you must get information. There are lots of things that I did not know when I went into the work, and there are lots of things that I do not know today; but a general man on an estate must know a little bit about electricity. He must know when a painting job is done thoroughly. My employer came to me not long ago and said, "Go into my house and do what you think is necessary." If he thought that I did not make myself familiar with the general run of work, he would not have trusted me to do that. He would have brought in someone else.

Make yourselves familiar, gentlemen, with what is going on about you; make yourselves worth just a little bit more than your employer is paying you. There are too many crooked men in this business, and too much crooked work going on. When I got my present employment I went to my employer and said, "I want so much a month, and when we make a bargain if I get tired of the job I will come right to you and say so." He said, "That is fair." When I got to the point where I thought I was worth a little more money I said, "I think now your place is worth a little more to take care of." He said, "How much?" I told him, and he said, "That is all right; I will date that back two months." Give your employer a square deal every time. I want to tell you gardeners that that is the point I make, that you should be perfectly straight with your employer. Put confidence in your employer and he will do what is right by you. The man who does the straight and right thing has nothing to fear. Do not be afraid to ask for what you want. As President Wirth said, they will give you what you want if they get a square deal. Too many men try to see how little they can do. Two or three years ago I was in Florida, and I found that the first idea of the negro is how little he can do and get away with it. Do not be in that class; make yourself worth something. I have never had any thoruble in getting anything that I wanted in reason. If you make yourselves worth it, the average employer will appreciate you. (Applause.)

PRESIDENT WAITE: This is a very profitable discussion, gentlemen, and I hope you will continue it.

MR. N. Y. PAYNE, Philadelphia, Pa.: I believe that honesty should count above everything else. The next thing is to keep on the job. The next thing is to make all the inquiries you can possibly make and learn all you can. Good college men with practical experience are like good seed, in that you cannot keep them down.

MR. P. W. POPP, Mamaroneck, N. Y.: Gentlemen, I am also believer in the gardener giving his employer a square deal. I believe, as Mr. Downs said, that if you make yourself worth the money the employer will recognize it. Of course, there are isolated cases where it is the other way; but a man that can make good generally has the option of going elsewhere. I have had my employer come to me and say, "Your work is very satis-That is a whole lot for an employer to say. That is my own experience. I believe that a man must know something about the stoke-hole, for if you delegate all of your work to some

one else you will not know whether they are firing right or wrong. It I live near by green-house I can see how the firing is being done; but a man who does not know how the firing should be done will not keep that sort of a watch on it. The gardener should know about many little details that mean much to the comfort of the owner.

#### Remarks of W. F. Gude, Washington, D. C.

Mr. President and Fellow Gardeners and Florists: I do not happen to be one of the college boys, and I do not happen to be a private gardener, but just one of the boys who started in the

stoke-hole and went all the way through.

I want to say to you, gentlemen, that we are employing on an average of eighty men commercially, and we have not a man or boy, no matter what his pay is, that we would ask to do anything that we are not willing to do ourselves. It is all how you take your work as to whether you make a pleasure out of it. I have been much impressed by some of the remarks made here as to the importance of knowing just how things should be done. In most every instance it will be found that people who are fond of flowers and can afford to hire private gardeners have nice homes and have at least a fair endowment of the humane instinct, and they will treat their men fairly. We had at the National Capitol for upwards of fifty years a private gardener, if you please, as superintendent of the United States Botanic Gardens, a gentleman who was born a poor Scotch boy, entirely too poor to go to school. As he grew up he educated himself, and with the first sixpence of his own that he had to spend he bought a copy of the works of the poet Burns. You will all remember that Bobby Burns was a gardener, and he drew the inspiration for many of his poems from nature. Mr. Smith finally came to Washington, and for the fifty odd years that he was superintendent of the United States Botanic Garden he did more in the halls of Congress and at the National Capitol in the way of disseminating knowledge of our work and ennobling our profession than any other one man that I ever knew anything at all about. And even up to the time when he passed to his Heavenly reward he was still the same plain man that he had always been, yet he was privileged to share the invimacy of such men as Andrew Carnegie at Skibo Castle and with other distinguished men; yet he never wished to be known as anything more than a gardener, and he was mighty proud of it. There was not a man or women living that was too proud to speak to Mr. Smith, or that he was too poor to associate with. His life presents an example that fits in nicely with Mr. Smith's paper that we have had.

Although I am not a private gardener or a horticulturist, but simply a plain ordinary florist who has grown from the ground up to my position, everything I have got I owe to my own endeavors, yet I like to feel that if duty calls me, or if I can do some good for my fellow-man, I thank God that He gives me strength to do all I can to help the other fellow along. (Ap-

plause.)

Now, even if Mr. Smith has passed to his Heavenly reward, I am not through working for him. While there might be many who can take up the proposition better than I can do and do what I am trying to do, yet I received in the last two or three weeks letters from California, from Maine, from New York, from the South, and all over, euclosing contributions to erect at the National Capitol a memorial to the late William R. Smith, which shall not only be a magnificent tribute to one of the best private gardeners, if you please, and horticulturists that I ever knew, but I believe one that did more to elevate the horticulture profession and the gardeners' profession, the tree men's profession, if I might use that term -because he is largely responsible at the National Capitol for the finest treed city on the face of the globe, in which his work lives after him.

So my mission today is to do all I possibly can to the end that within a few years there shall be erected at the National Capitol a memorial to the late William R. Smith, Superintendent of the United States Botanic Garden, that will be a fitting tribute to the man who did so magnificently for his country. While he was a true Scotchman, he was a thorough American, and we want this memorial to not only be a tribute to him but one in which every gardener of the United States and every member of any organization of florists or horticulturists can take pride; a memorial that when you look upon it you will say, "That was a grand man. I am proud of my profession for recognizing and rewarding such a man."

Let us not forget that Mr. Smith always took greatest pride in the fact that he was only a gardener, a member of one of the grandest professions on the face of the earth, because, as he used to say, it linked the finite and infinite and tends continually to uplift mankind and make man purer and better.

In thinking over the life of Mr. Smith it was borne in upon me that he more than any man I have ever known exemplified the lines of his favorite poet. Bobby Burns, that are so well known to all of you "The rank is but the guinea's stamp. A man's a man for a' that."

You know the rest of it.

Gentlemen, let us get together, and whether we can give little or much, contribute to the memorial at the National Capitol; and it is my hope that in the near future we shall have at the National Capitol there a magnificent memorial of that representative gardener. William R. Smith—a memorial that shall be an education for future generations and a tribute to the plain, simple and homely virtues of William R. Smith. I thank you. (Applause.)

MR. EBEL: Mr. Chairman, I move that the National Association of Gardeners open a subscription list and permit those of its members who may desire to subscribe to the William R. Smith memorial fund to do so. In this way we will aid the Society of American Florists in providing a suitable memorial for Mr. Smith.

The motion carried unanimously.

PRESIDENT WAITE: Is there any further business?

Mr. Vernon T. Sherwood, Charlestown, N. H., brought up the subject of a big white worm about two inches long that was doing some damage in his section, and proposed remedies for this and other worms were discussed by Messis. Sherwood, Craig. Downs O'Brien, Popp and others.

MR. O'BRIEN: I think that if the members of the National Gardeners' Association had a badge or button of some kind to wear it would increase the national spirit. It would indicate to other members that he belonged to the organization, and he would receive recognition the same as the Masons or Odd Fellows or something like that.

MR. WM COLLINS, Boston, Mass.: One of the gentlemen over here spoke of a National button. Personally, I think a little button would not be a bad idea at all of a suitable design, to be worn by every member of the Association. We are doing all we can to popularize this society, and the button is one way of doing it. It is a cheap method. For instance, some of us are wearing the S. A. F. button, which indicates that we are members of that Association; but if you meet a gardener you do not know whether he is a member of the National Association or not. If we had some identifying badge, we would know each other, and when we met a member we could talk with him on subjects congenial to both. On motion the subject of an Association button was referred to

On motion the meeting now adjourned without day.

the Executive Committee.

The following were among those in attendance: W. H. Waite, Yonkers, N. Y.; Martin C. Ebel, Madison, N. J.; Thomas W. Logan, Jenkintown, Pa.; William Anderson, South Laneaster, Mass.; J. Canning, Ardsley, N. Y.; Daniel MacRorie, San Francisco, Cal.; Theodore Wirth, Minneapolis, Minn.; R. Williamson, Greenwich, Conn.; E. J. Norman, Lenox, Mass.; Robert Johnson, Smithborough, Mass.; George Westland, North Andover, Mass.; C. B. Turner, Roxbury, Mass.; John S. Hay, Philadelphia, Pa.; Trenneth Finlayson, Boston, Mass.; George F. Stewart, Medford, Mass.; Robert Dougherty, West Medway, Mass.; Vernon T. Sherwood, Charleston, N. H.; Andrew Wilson, Springfield, N. J.; William E. Picthall, Dover, Mass.; William Angus, Buzzard's Bay, Mass.; Andrew Keith, Chestnut Hill, Mass.; J. Smith, Swampscot, Mass.; P. M. Miller, Boston, Mass.; James Marlborough, Topsfield, Mass.; James Stuart, Mamaroneck, N. Y.; Luther Webb, Dedham, Mass.; David Weir, Rosendall, Mass.; W. N. Cruig, Brookline, Mass.; John Dugnid, Wellesley, Mass.; C. H. Hallier, Hopedale, Mass.; A. J. Newell, Hopedale, Mass.; E. M. Ross, Morristown, N. J.; George W. Hess, Washington, D. C.; George Mason, Elberon, N. J.; P. W. Popp, Mamaroneck, N. Y.; William Downs, Chestnut Hill, Mass.; Alexander Michie, Plymouth, Mass.; James Hamilton, Warwick, R. I.; N. Y. Payne, Philadelphia, Pa.; John T. Burns, New Canaan, Conn.; John J. O'Brien, William Powns, Chestnut Hill, Mass.; Alexander Michie, Plymouth, Mass.; Luke O'Reilly, Madison, N. J.; John F. Huss, Hartford, Conn.; William Plath, San Francisco, Cal.; William Collins, Boston, Mass.; Luke O'Reilly, Madison, N. J.; John F. Huss, Hartford, Conn.; C. N. Tolin, Colorado Springs, Colo.; William F. Gude, Washington, D. C.; John Young, New York, N. Y.; Prof. E. A. White, Ithaca, N. Y.; Oscar Carlson, Fairfield, Conn.; William De Bree, Rutherford, Conn.; William Cruickshank, Boston, Mass.; William Kennedy, Chestnut Hill, Mass.; William Plumb, New York.

# ANNUAL CONVENTION, PHILADELPHIA, DECEMBER, 1914.

At the executive meeting of the board of trustees and directors held at the Copley Square Hotel, Boston, Wednesday morning, August 19, it was unanimously voted to hold the next annual convention in the city of Philadelphia during the first week in December. The convention will be of two days' duration; the business meeting to be held on the first day, followed by a banquet in the evening; a bowling contest in the morning and seeing Philadelphia in the afternoon of the second day.

# MIDSUMMER MEETING IN SAN FRANCISCO,

At the mid-summer meeting of the association Daniel MacRorie, of San Francisco, Cal., presented an invitation from the Panama-Pacific Exposition Company and from the Pacific Coast Horticultural Society, of which H. Plath, of San Francisco, who also attended the meeting, is president, to have the National Association of Gardeners meet in San Francisco next year. Mr. MacRorie, among other things, urged that favorable action would result in material increase in membership on the Pacific Coast and that as the association is a national one it should not confine itself to sectional limits in holding its meetings. It was voted unanimously that the association hold its mid-summer meeting in San Francisco in August, 1915.

#### NEW MEMBERS.

The following new members have been added to the roll during the past month: Carl N. Fohn, Colorado Springs, Colo.; James A. Wilson, Lake Forest, Ill.; William Anderson, North Adams, Mass.; Gustave Hamerin, Glen Cove, L. I.; George Willis, Stockbridge, Mass.; James Davidson, Tuxedo Park, N. Y.; Henry J. Watson, Tuxedo Park, N. Y.; Robert Cameron, Cambridge, Mass.; John G. Duguid, Natick, Mass.; M. J. Pope, Naugatuck, Conn.; William H. Robinson, Norfolk, Conn.; John L. Smith, Swampscott, Mass.; Albert J. Newell, Hopedale, Mass.; William Angus, Buzzards' Bay, Mass.; J. L. Porter, Villa Nova, Pa.; David Fraser, Pittsburgh, Pa.; James Marlborough, Topsfield, Mass.; Edgar A. Slote, Middletown, N. J.

#### BRITISH GARDENERS' ASSOCIATION.

The most representative meeting the association has ever held took place at the Thatched House Hotel, Manchester, on July 25. Delegates and members were present from New, North London, Leannington, Blackburn, Leeds, Sheffield, Altrincham, Central London, Birmingham, Dublin, Manchester, Accrington, Oxton, Liverpool, Bolton, Northampton, Bradford, Nantwich Hampton, and other places.

The Chairman, Mr. Gerald W. Butcher, had a good reception when he rose to open the conference, and wel-

come the delegates.

Great enthusiasm was evoked by the reading of the following message from comrades abroad:

Madison, New Jersey, July 17th, 1914.

To the Members of the British Gardeners' Association. The members of the National Association of Gardeners (of Imerica) greet you at your Innual Conference, and as brother gardeners extend to you the right hand of fellowship in the cause for which we are all striving—the elevation of the oldest profession on earth—that of gardening.

As there is strength in unity, all gardeners should unite in an effort to uplift their profession and to gain for it the recognition to which it is justly entitled. While the conditions which govern the gardeners in the United Kingdom and in America are not alike, there are, however, many opportunities for co-operation between the gardeners' national associations for the general betterment of gardening; so we extend to you an invitation to join us in the co-operative movement which we are about to inaugurate in the United States. Your co-operation would make it international.

WILLIAM H. WAITE, President, M. C. EBEL, Secretary.

Journal of B. G. A.

### AMONG THE GARDENERS

Peter Duff, of "Brighthurst," Orange, N. J., who was on a visit to Scotland at the outbreak of the European war, arrived home safely a fortnight ago. Mr. Duff intended to return in time for the summer meeting of the National Association, but was delayed by the war and consequently could not get back in time.

Arthur Griffin, who was reported in the last issue of THE CHRONICLE as having accepted an appointment as superintendent of a New London, Conn., estate, is in charge of the Landers Estate, of that place. Extensive alterations are contemplated, which will include a new range of glass.

Joseph Robinson has resigned his position as superintendent of the estate of Colgate Hoyt, Oyster Bay, L. I., to take effect October 1, when Mr. Robinson will assume the superintendency of the Coe Estate, of the same place.

John Dodds, of the Wanamaker Estate, Wyncote, Pa., arrived home from Europe on the 13th. Mr. Dodds was accompanied on his vacation by his daughter, Isabelle. Their pleasure was, of course, marred by the breaking out of the war.

Advices received from William Kleinheinz, of the Widener Estate, Ogontz, Pa., who was in Germany when the hostilities broke out, state that he expected to leave for Philadelphia on the 5th inst. via Rotterdam.

George H. Penson has resigned his position as foreman in charge of the fruit growing department of Duke's Farm, Somerville, N. J., to take charge of the Johnson Estate, New Brunswick, N. J., on October 1. Some important improvements are to be instituted on this place. A. W. King succeeds Mr. Person in his position at Duke's Farm.

Alfred E. T. Rogers, has been appointed superintendent of Judge William H. Moore's estate, at Pride's Crossing, Mass. Mr. Rogers was formerly on the estate of the late Ex-Governor Draper at Hopedale, Mass.

George Wyness, who was erroneously reported in the last issue of THE CHRONICLE as in charge of the Moore Estate, still holds forth as superintendent of the Henry C. Frick Estate, Pride's Crossing, Mass., which is famous for its beautiful lawns and rock gardens.

A postal recently received from A. A. Macdonald, superintendent of Duke's Farm, Somerville, N. J., stated that he expected to sail from England for home on the 14th inst.

William Westland, for the last five years with C. H. Parker, Cotiut, Mass., and previous to that with Francis Blake, of Auburndale, Mass., will on October 1 take charge of Mrs. Wadsworth's estate at Genesco, N. Y. Mrs. Wadsworth is a sister to Mrs. Parker, his former employer.

The employees on the estates of E. D. Brandegee and Larz Anderson, Brookline, Mass., played a game of baseball on August 29. The weather was disagreeable and damp, but a good game resulted in a victory for the Anderson team of 27 to 14. A football game which was to have followed the baseball game was forfeited by the Anderson team who refused to play on damp ground.

### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. S. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

By the action of the Executive Committee at a special session held in New York City on August 27, the matter of the selection of an official organ for the association, which matter had been by action of the convention, referred to the Executive Committee with power to act, was settled by the acceptance of a very attractive proposition made by the representative of the *Gardeners Chronicle* and by unanimous vote this publication was selected as the organ of the association.

By action of the convention, the official organ hereafter will be sent only to those members who are in good standing, so those who are in arrears should remit promptly if they expect to receive the official organ.

Through the courtesy of the publishers, the September number of this publication is without expense to the association, being sent to every name on the membership roll whether in good standing or not, also to all persons who attended the convention. However, beginning with the October number, the magazine will be sent only to those who are in good standing as certified by the secretary.

Our department in the magazine this month will be given over to a review of the Newburgh and New York convention, but beginning with October the secretary hopes with the assistance of correspondence and contributions from members, to maintain a section of the magazine which will be of general interest.

ROLAND W. COTTERILL, Secretary-Treasurer.

Seattle, Washington.

SIXTEENTH ANNUAL CONVENTION, AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS, NEWBURGH, N. Y., AND NEW YORK CITY, AUG. 24-27, 1914.

Lie sixteenth annual convention of the American Association of Pari, Si perimendents opened at Newburgh, N. Y., on Monday

afternoon, August 24, and concluded in New York City on Thursday night, August 27.

The executive board met at the headquarters. The Palatine Hotel, on Monday afternoon and disposed of the business before it. In the evening the general meeting was called in the Young Men's Christian Association Building. President H. S. Richards presided. Mayor Corwin, of Newburgh, welcomed the members to his city, referring to it as the home of Downing, for it was there that he was born and made his home. At the conclusion of Mayor Corwin's remarks, that the members may find where Downing lived and worked and found inspiration, an atmosphere so congenial to the work of the convention that it might accomplish much of profit and benefit and that they may take with them when they leave no memories but pleasant ones, he was heartily applauded.

heartily applauded.

Mr. William Cook Belknap, representing the Newburgh Board of Park Commissioners, was the next speaker. He referred to his pleasant meeting with the members of the association at their convention in Boston two years ago and of his seventeen years' association with the Newburgh parks system, which has led to intimate acquaintances with men engaged and interested in park development.

President Richards briefly responded to the addresses of welcome, saying "it is quite evident that the good citizens of Newburgh will entertain us royally while we are in their midst and will give us an occasion to remember for some time to come the happy hours spent among them. The members of the association will, I am sure, unite with me in expressing our appreciation of the efforts of these good people to make our convention a notable success and in extending our gratitude for the hospitality shown us during our stay here." With the greetings ended the actual business of the convention was then taken up.

Secretary Levison submitted his annual reports and reported that the association was in better condition financially than it had been for years. Some discussion arose regarding the expenditures incurred in the publication of special bulletins, and it was voted that the matter be referred to the Executive Committee. The Auditing Committee reported that it had approved the accounts of the secretary and treasurer, which were voted to be received and placed on file.

W. S. Manning, chairman of the Committee to Revise the Constitution and By-laws, submitted his report on the revision of Section 11, Article 11, of the Constitution concerning qualification for membership in the several branches and duties of the members. This led to a lively discussion, pro and con. the question being finally put to a vote and the recommendations of the committee to revise the by-laws were adopted.

CONVENTION OF AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS AT TUNEDO CLUB, TUNEDO PARK, N. Y

The secretary reported that the Executive Committee had recommended the following candidates for membership: Arthur P. Perley, South Bend, Ind.; Warren H. Manning, Harrisburg, Pa.; R. H. Huntington, Council Bluffs, Iowa; M. C. Ebel, Madison, N. J.; John B. Corwin, Newburgh, N. Y.; Henry H. Eckert, Niagara Falls, N. Y.; James O. Howard, Castile, N. Y.; E. S. Letts, Denver, Col.; Arthur A. Deischgald, Chisholm, Minn.; David Campbell, Syracuse, N. Y.; Nelson Crist, Atlanta, Ga.; Edward A, Philbrick, Detroit, Mich.; Robert L. Parker, Hartford, Conn.; Frank Hamilton, New York, N. Y.; George W. Hess, Washington, D. C. The applicants were elected to membership by unanimous yote.

President Richards named William J. Zartmann, New York City; Theodore Wirth, Minneapolis, Minn.; Emil T. Mische, Portland, Ore., a Committee on Nominations for the selection of can-

didates for officers for the ensuing year.

Prof. Frank A. Waugh, professor of laudscape architecture of the Massachusetts Agricultural College, Amherst, Mass., was next introduced and presented a brief sketch of the life and works of Andrew Jackson Downing. He paid a glowing tribute to the great master of landscape gardening. Referring to the life of Downing, Prof. Waugh said: "Andrew Jackson Downing must be remembered to us first of all as a nurseryman. It was in this field that his life began. In this field he learned great lessons which yielded him the most substantial and obvious help in other lines of work. Moreover it was through his nursery work that he reached and profoundly influenced hundreds of men in other parts of the country. It is probably true that Downing's stanchest personal disciples were the men who formed their attachment to him at this point. His architectural work was of very considerable consequence. While undoubtedly it represented that part of his thought which has proved of least worth to us in our generation, yet it was credited in its time with far-reaching influence for good. In any study of his intellect and character it is obligatory to take into the account the wide, serious and fruitful study which he gave to this subject.

"His literary fame rests upon a most substantial basis, seeing his product had both matter and style. He had real first hand information to communicate. Much more than that he had sound personal opinions a product of careful personal study by a most extraordinary mind. This information and these opinions were offered to the world in the best literary dress of the times in a

style clear, finished and distinguished.

"The feature of his services to us, and one which seems to have been widely overlooked, was his practical establishment in America of the profession of landscape architecture as it is now fashionably called, though he always spoke of it under the good old English terms of landscape gardening. Other men had undoubtedly practiced this art in America before him, but his genius soared so far above all else that had ever heen done as to put the whole profession upon a new plane.

Out of this story which we necessarily trace with much difficulty of the personal influence of Downing in the beginnings of the profession there emerges, however, one conspicuous incident. Calvert Vaux has already been mentioned as coming to America in 1850 to be associated with Downing in his professional work. This very able and well-trained young architect doubtless had a considerable influence upon his acute and impressionable partner; but it is quite certain that the strong qualities of Downing left their imprint upon Vaux. The professional work undertaken by them jointly was continued by Vaux after Downing's death. And then, a few years later another most fortunate juncture occurred when Vaux in his turn became professionally associated with the late Frederick Law Olmsted. With the long and notable career of Olmsted landscape architecture became an established and recognized profession and one in which the highest ideals were so firmly fixed as to never again be lost or obscured. The triple association of Downing, Vaux and Olmsted forever formed the great opening chapter in the history of the landscape profession in America.

Mr. Oglesby Paul, landscape gardener at Fairmount Park, Philadelphia, Pa., was on the program to deliver a lecture on "The Preservation of Natural Woodland Under Park Conditions." Owing to illness Mr. Paul was enable to be present, but he had sent his paper and views, which were projected on a curtain from a stereopticon, to Mr. Herman Merkle, of the New York Zoological Gardens, and who read the paper. Mr. Paul's paper entered into the various phases which surround the upkeep of the woodland, saying, "To preserve natural woodlands under city conditions is a costly and difficult work, perhaps the most difficult of all park maintenance. And," speaking of conditions in Philadelphia, "the funds are far too small to handle the situation properly, but interest in it is steadily growing to all departments of the city government so that now we find the city engineers deflecting streets and sewers to save forest growth on areas likely to be acquired for park purposes. No artificial park landscape, even though planned by a forester, has ever approached the noble dignity and infinite loveliness of our Eastern forests, and surely none of these is fairer than our Wissahickon, so we feel that they are worth all and more than they cost to preserve.

SHOWROOMS OF COLDWELL LAWY MOWER COMPANY, CONVERTED INTO BALLROOM FOR SAMERICAN ASSOCIATION OF SUPERINTENDENTS, CONVENTION

Mr. J. J. Levison supplemented this fecture with another illustrated talk in which he described briefly the methods employed in other cities in carring tor park lands.

other cities in caring for park lands.

Owing to the lateness of the hour, much time having been taken up in the discussions and the reading of papers, it was decided to postpone the election of officers until Wednesday morning when another husiness session was called on the steamer which took the members to Bear Mountain Park. The meeting adjourned to convene again on Wednesday morning.

#### Tuesday, Trip to Tuxedo Park and Harriman Estate.

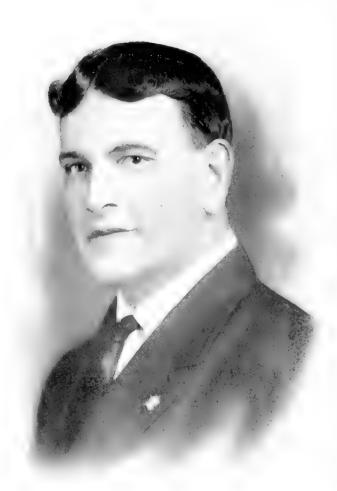

Tuesday, August 25, was given over entirely to pleasure by the visiting members. A visit to Mt. Beacon, one of the highest points in the vicinity of Newburgh and famous from Revolutionary times was enjoyed by the early risers. The trip was made at 7 a. m., in order to return in time for the automobile trip which was scheduled for 10 a. m. Shortly after that hour some lifty-odd automobiles, provided by the citizens of Newburgh, left the association's headquarters, The Palatine Hotel, for a tour of the city, visiting the home of Andrew J. Downing, Downing Park, Washington's headquarters, and many of the historic places for which Newburgh is famed. En route through the city the visitors were entertained by citizens, who threw open their gardens and homes for inspection.

At noon the pilgrimage to Tuxedo Park began through Tuxedo valley. There was no prescribed route, each chanffein using his evar judgment, the only requirement being that all should arrive at the club grounds as near 1 o'clock as possible. The day was an ideal one ter an outing of this sort. Arriving it Tuxedo Club the guests were escorted to the dining room, where an excellent lunch was served. Following the luncheon the members and friends assembled in front of the clubhouse for a photo of the party, after which they returned to the automobiles for an inspection of Tuxedo Park. The passage around the lake was a series of surprises to all. Along the lake are located some of the linest private estates in this section of the country. Leaving the Park the trip was continued to Mrs. E. H. Harriman's private estate, at Arden. This place is located on top of one of the

G > AMRYHN, SUPERINTENDENT OF PARKS, NEW HAVEN, CONN.

1 lected President America, Association of Park Superintendents,

R. W. COTTERILL, SECY PARK COMMISSION, SEATTLE, WASH, Elected Section 1 (Superintendents). Superintendents.

mountains and the winding roads leading to it required some ability on the part of the drivers of the automobiles, especially on the return. From the Harriman estate a magnificent view of the surrounding country was obtainable. The party arrived back at Newburgh early in the evening.

#### Reception at Coldwell Lawn Mower Building.

The visit to Newburgh culminated in the reception given in the spacious factory building of the Coldwell Lawn Mower Company on Tuesday evening. It is estimated that some fifteen hundred people attended, this including many of Newburgh's residents. The salesroom was beautifully decorated with bunting and plants. An orchestra furnished music for the dancing, while those preferring cards found the offices prepared for them with card tables arranged about the spacious floors. During the evening those who desired were escorted through the building to inspect the plant. A military band was located on the park grounds surrounding the factory on the river side, which was beautifully illuminated. An open air concert was provided and some of the guests enjoyed dancing on the green sward.

While the reception was at its height the Newburgh Yacht Club surprised the visitors by honoring them with an illuminated naval parade. The club's fleet sailed past the plant shortly after 9 o'clock, each boat elaborately decorated, and in passing whistles were sounded and salutes fired, concluding with a fireworks display from some of the floats on the river.

Messrs. W. H. Coldwell, H. W. Marshall, H. P. Coldwell and E. C. Ross received the guests as they arrived at the building and after their arrival left nothing undone to make them feel at home.

President Richards, in speaking to the press of the meeting at Newburgh, said; "We expected considerable from the character of the people we have met at our conventions from your city, but the greatest of our expectations were not up to what you have done for us. You have shown us people with hearts so large that they seemingly fill the entire body; you have shown us buildings of local and national historical legends; we

have traversed grounds sacred to every American heart; we have visited a park that was apparently designed by Nature's God as a fitting ornament to the crown of the queenly city in which you live. We have been entertained, dimed, amused and made to feel that we were in reality brothers and sisters of the 'Newburgh burch,' and best or all we have had the largest meeting in the history of our association. Much is due to the enthusiasm aroused by your local park hoard and our associate, the superintendent of Downing Park. There has not been a minute of the time that we have not had some one of the members at our beck and call, each desirous of offering some kindness, or doing something that would lighten our labors or make our visit more pleasant. To your mayor, Mr. Corwin, to your Park Board, Messrs, Belknap, Smith, Leonard and Coldwell, to Mr. Haible and to the local press the thanks of the association are justly due. I appreciate all that has been done, and I voice at the same time the appreciation of the American Association of Park Superintendents."

#### Wednesday, Trip to Bear Mountain Park.

On Wednesday morning the association became the guest of the Hon. George W. Perkins, president of the Inter-State Park Commissioners. The steamer "Albion" was boarded at Newburgh

at 10 o'clock and proceeded down the Hudson River.

Immediately after leaving Newburgh the business session was called to order and the election of officers took place. The nominating committee reported its ticket as follows; For president, Gustave II—Amthyn. New Haven, Conn.; G. W. Burke, Pittsburgh, Pa.; for secretary and treasurer, J. J. Levison, Brooklyn, N. Y.; R. W. Cotterill, Seattle, Wash.; for vice-presidents, John W. McLaren, San Francisco, Cal.; Herman Merkel. New York, N. Y.; Carl M. Fohn, Colorado Springs, Colo.; Charles Hable, Newburgh, N. Y.; Charles B. Carpenter, Milwankee, Wis.; F. L. Mulford, Washington, D. C.; J. H. Prost, Chicago, Ill.; M. A. Moore, Toledo, Ohio: E. P. Griflith, St. Louis, Mo.; John Henderson, Montreal, Canada; E. R. Mack, Wilmington, Del.

The following officers were elected: Gustave H. Amrhyn, president; H. W. Cotterill, secretary and treasurer: Herman Merkel, John W. McLaren, John Henderson, Carl M. Fohn, and

J. H. Prost, vice-presidents.

Invitations for the next meeting place were called for, and Secretary Levison reported that he had several invitations from Chambers of Commerce and Boards of Trade from various cities. Daniel MacRorie, of San Francisco, Cal., presented an invitation from the President of the Panama-Pacific Exposition Company and from John McLaren, Superintendent of Parks, San Francisco. inviting the association to convene in San Francisco next year. After several members spoke in favor of going to the Pacific Coast next year, it was unanimously voted to hold the next convention of the American Association of Park Superintendents in San Francisco in 1915.

A hearty vote of thanks was tendered J. J. Levison for his untiring services rendered to the association while serving as its secretary during the past two years, following which the meet-

ing was adjourned.

The first stop was at West Point, where the party had an bour to visit the various points of interest at the famous U. S. Military Acidemy. From these the steamer proceeded directly

to Bear Mountain Pick where the party was received by Mr. Perkins and entertained at bunch by him. Following the lunch Mr. Perkins briefly outlined the work of the commission, of which he is chairman. The Inter-State Park comprises land in the he is chairman. The Inter-State Park comprises land in the State of New York and New Jersey, ten thousand acres of which being the gift of Mrs. E. H. Harriman, who has also generously contributed \$1,000,000 for development work. Some 18,000 acres have been given by the States of New York and New Jersey. A grand boulevard to be known as the Hendrick Hudson Boulevard is now under course of construction from a point on the New Jersey shore opposite New York City to Newburgh, N. Y., a distance of about sixty miles. Bear Mountain Park is maintained for the people of New York City, a regular line of steamers being operated between the city and the park, which is about forty miles up the river. Mr. Perkins explained that it is the purpose of the commission to provide an outing place for New York City people where they may spend a day at a nominal cost. The restaurant is maintained by the commission, where food is provided at nominal prices, as is also the fare on the steamers. Sites are laid out for camping purposes, for which there is no charge, though a permit is required from the secretary of the commission.

From Bear Mountain Park the steamer proceeded down the Hudson River to New York City, where the members disembarked to meet again the following morning.

#### Thursday, Meeting in New York.

The members assembled at the Hotel Astor, the headquarters of the convention in New York City, at 10 o'clock on Thursday morning. In the absence of Mayor Mitchel of New York, Hon. Henry Bruere, City Chamberlain, welcomed the gathering to New York City. He was followed by the Hon. Cabot Ward, president of the New York Park Board. Mr. Ward in his remarks urged closer co-operation between the practical men of the parks, the park superintendents and the executive staff, the commissioners. President Richards responded fittingly to the addresses of Messrs. Bruere and Ward, after which the members adjourned to the hotel entrance where automobiles were in waiting to convey the party on a sight-seeing trip through the park system of New York City. Proceeding up Broadway to Central Park, through it to Riverside Drive, Van Cortlandt Park, Mosholu Parkway to New York Botanical Gardens, the Zoological Gardens were reached at noon. After viewing the Zoological Gardens the party became the guests of the New York Zoological Society at luncheon.

The newly elected officers, constituting the executive board of the association, met during the stay at the Zoological Gardens for the purpose of organizing. It voted to adopt the Gardeners' Chronicle of America as the official organ of the association in

place of the publication heretofore representing it.

Following the luncheen the party re-entered the automobiles and, passing many of the smaller parks and playgrounds of New York City, proceeded to Brooklyn and Prospect Park. After stopping at several points of interest in Brooklyn's famous park, they continued by way of the Eastern Parkway to Coney Island, where the evening was spent visiting the various places of amusement. This concluded the 1914 convention, one of the most successful in the history of the association.

(Continued from page 173.)

maintenance and operation of that district in all respects, nothing is left uncovered. Of course, the districts will be altered, combined, subdivided, and otherwise changed from time to time as circumstances render advisable, just as the foreman in charge will be occasionally shifted from district to district; but at any one time the responsibility of each foreman should be complete and exclusive as to his own district and the limits of the district absolutely definite. His discretionary power must be limited by instructions from the superintendent, but it should be made clear to him that it is his duty to call the attention of the superintendent specifically to any limitation or adverse condition which in his opinion needlessly and unreasonably interferes with his getting the best possible results. If there is anything in his district which is not as it should be, and which is beyond his power to correct, either through lack of means or lack of authority. he must put the question squarely up to the superintendent or it will remain up to him.

. It is obvious, however, that where such a large variety of technical questions are involved as in park work, such a simple territorial division of duties and responsibilities is not in itself sufficient. It would imply a range of specialized technical skill within each division which it is impracticable to secure. Such specialized skill must be concentrated in centralized staff departments, each specializing on a certain class of functions, regardless of locality, but all working through or in collaboration with the foremen of the local districts. In so far as any staff department works through a local foreman, it transmits to that foreman all the necessary orders concerning the functions under its charge, and inspects his execution of the same; thus the engineering department transmits to a local foreman the instructions of the superintendent as to the building of a road, in the form of stakes set in the proper locations and at the proper grades, and inspects his work to see that it conforms to the instructions. In so far as any staff-department works not through a local foreman, but in collaboration with him, it relieves him of the direct performance of a part of the work of his district; thus the engineering department not only sets stakes for a pipe line in a park as the local foreman is not equipped to do the work but the engineering department may also furnish a special pipe gang working entirely under its orders, and transferred by it from one district to another as occasion requires.

In thus superimposing a functional division of duties and responsibilities upon the basic territorial division with which we started, there is a real danger of confusion and of weakening the clear sense of personal responsibility on the part of the local division foreman necessarv to efficient service. This danger is the more obvious when we consider that, in addition to the engineeringstaff department, there must be departments specializing on other subjects, such as the improvement and care of lawns, plantations, etc., the repair of buildings, etc.; and that it is impossible to define the scope of such functional departments exactly, as can be done with a territorial division, so that there is always more or less overlapping and conflict of authority between them. In order to minimize this danger, it should be made absolutely clear that, while the local division foreman must presume any instructions received from a staff-department to be a proper interpretation of the intention of the chief executive, vet, if it appears to him that any instructions in regard to his territory issued by any staff-department tend to conflict with those issued by another staff-department or lead toward results for which he is unwilling to accept responsibility, then it is his duty to report the situation to the superintendent. In the absence of such report, he should be held responsible for anything going wrong in his division.

The general responsibility for all classes of work in his entire district which is thus recentralized upon each local division foreman provides a means for insuring in each locality the proper coordination of the work of the several staff-departments without assuming a superhuman personal watchfulness on the part of the general superintendent. The inevitable vagueness of the limits which separate the duties and responsibilities of staffdepartments in charge of different classes of operations in the same territory will lead, in spite of the best intentions, to conflicts of jurisdiction, to action by one department in ignorance of or in disregard of the conflicting purposes of another department; and, what is perhaps more serious, there are bound to be matters which are ignored by every department on the assumption that it is the business of some other department to look after them. The responsibility for finding these defects and bridging these lapses can be carried personally by the general superintendent for a small or concentrated territory, but for a widely scattered system of parks it must be delegated by him and squarely placed upon the shoulders of the division foremen.

In order to bring home these responsibilities definitely, and also as a desirable check upon the propriety of all expenditures, the charging up of the cost of any work done and supplies or materials furnished for a local division under the instruction or supervision of any staff-department should be approved both by the local division foreman and by the head of the staff-department in question. The charging up of such of the expenses of a staff-department as are not chargeable against any local division, but are properly overhead charges against the whole park system, should be approved by the head of the department. The charging up of expense for a local division not incurred under the supervision of any staff-department should be approved by the foremen of the division.

Nothing can be done without incurring cost, and the approval of cost entries involves assumption of responsibility for having the work done, and for its reasonable efficiency. The approval of both the local division foreman and a staff-department to each cost entry, or the refusal of either of them to give such approval, brings home the responsibility more definitely and more universally than anything else can.

I believe that a division foreman, instead of being kept in ignorance of the state of the appropriation for his work, instead of being required to execute blindly from week to week the detailed orders of the superintendent without knowing when his force may have to be cut down, should be required to know how the accounts of his division stand, and should be encouraged up to the limit of his capacity to plan his work ahead for himself with a view to accomplishing the utmost possible with the available funds and saving on all the unessentials for the sake of the more important things. To repose this confidence in the foremen and place this responsibility upon them not only tends to relieve the strain upon the superintendent but develops the self-respect and self-reliance of the foremen, increases their intelligent interest in their work and makes for efficiency all along the line.

Under a proper budget system of estimates and accounts, the superintendent, well in advance of the first of the year, would direct the preparation of detailed estimates of the cost of all the contemplated operations, both of maintenance and improvement, for each park. So far as practicable, these would be made by the responsible foremen in consultation with the several staff-departments. These estimates, together with those for

general and overhead expenses, and with proper allowances for contingencies, would be presented to the board, and would form the basis for a systematic, deliberate and well-balanced apportionment of funds for the entire year, subject only to such changes and transfers during the year as the board might, with equal deliberation, find expedient. The estimates, revised to conform to the decisions of the board, would show what each foreman expected to spend in each park on each class of work, and what he expected to accomplish by such expenditure. His time-sheets would be provided in advance with headings corresponding exactly with the subdivisions of his estimate, under which he would merely have to enter the time. The name of each subdivision of each account would be fixed and constant in form, its meaning would be clearly understood by the foremen who had made up the estimates, and the distribution of costs in the books would be practically automatic. Transfer charges and charges for supplies, materials, etc., would be allowed to stand against any subdivision of the account only with the knowledge of the foreman responsible for the work and for the estimate of its cost. He would be watchful of the correctness of the charges, and eager to accomplish within the appropriation what he had estimated that he could accomplish. Most of the charges, both for time and materials, being for work done under a staff-department, would be checked also by a department head.

Such methods are well known, and in those cases where they have been fairly tried have abundantly proved their value.—From Landscape Architecture.

(To be continued in October issue.)

#### SUMMER MEETING OF THE AMERICAN ROSE SOCIETY.

#### The Presentation of Medals to Messrs. Walsh and Cook.

The awarding of the Mis, Gertrude M. Hubbard Gold Medal for the best rose of American origin within five years was carried out at the Boston meeting of the American Rose Society. fine medal went for the rose "Excelsa" to Mr. M. H. Walsh, of Woods Hole, Mass. The rose "Radiance" was designated by the judges at the Hartford Rose Gardens and a silver medal was especially awarded for its excellence to Mr. John Cook, of Baltimore, The presentation teatures were as follows:

PRESIDENT PIERSON: Gentlemen, we have with us today two of the old men in the business. I am going to ask Mr. E. G. Hill, a gentleman that you all know, and you know is connected with the rose business, to present to our good old friend and good rosarian, Mr. Walsh, the Gertinde M. Hubbard Gold Medal, awarded to Mr. Walsh in recognition of raising the rose "Excelsa," I would like to introduce Mr. Hill.

#### Presentation of Hubbard Gold Medal to Mr. M. H. Walsh.

E. G. HILL, Richmond, Ind.: Mr. President and Gentlemen, I am sure that this is a pleasant duty. This splendid medal has been given to this society through the gracious kindness of woman who was interested in roses and rose growing. I think that we rosarians and others assembled here greatly appreciate the thoughtfulness of Mrs. Hubbard in thus providing this fine testimonial to be given to the one who should produce the finest and most useful rose in the last five years. Now, I understand that this modal has been given for the most splendid rose raised by Mr. Walsh, the name of which is "Excelsa." I want to say something about the "Excelsa" rose. When I went to London some years ago Mr. Walsh had sent there a specimen of the "Excelsa" and some of his other roses; and do you know, the British public at once pronounced this "Excelsa" rose as one of magnificent value. I saw plants here eight or nine feet high. clothed from top to bottom with beautifully colored flowers, and I was delighted and charmed. I have wondered a great many times whether we in America have ever fully appreciated the great work done by Mr. Walsh. He certainly has given us varieties which adorn, and will continue to adorn, great numbers of our gardens in this country; and I think it is very fitting and proper that this medal should go to him. Now, another thought. I hope some day that this medal will go to some man who will take up our native species, and from some of our best and hardiest hybrid teas produce roses which shall be free from what we call black spot and which will flourish in our American gardens. I believe that that can be accomplished. I believe some day it will be done. But let me tell you, some one will have to do it

who is disinterested, who is not always looking at the dollar at the end of the accomplishment; for up to this date there has been but very little money to any man who has raised a rose for the embellishment of our gardens. Is not that the fact, Mr. Walsh,

to a very great extent?

I would like to have this society take this matter into careful and serious consideration, and see if we could not give this medal in the future to some man or woman who will take our native species and give us hybrids from the teas, because I believe through that medium we are to secure roses that will grow and flourish in our climate. Climatic conditions to a great extent are against the beautiful roses that grow and thrive so finely in England, France and Ireland. We have got to have some material in our roses that will enable them to withstand the heat of our summer and to withstand the terrible disease of black stock as we call it. They will have to have different blood in them, I thoroughly believe. Now, Mr. Walsh, I have the very great pleasure of presenting to you this beautiful medal. (Presenting medal to Mr. Walsh).

PRESIDENT PIERSON: May I be the first to congratulate

you, Mr. Walsh?

#### Response by M. H. Walsh, Woods Hole, Mass.

Mr. President and Mr. Hall, I can assure you it gives me great pleasure today to receive this beautiful token of what I have accomplished. I consider it an honor. Of course, I have accomplished nothing but what other people could have done and probably done it better; but it has been an encouragement and an inducement to strive to do better and to take up other species, as Mr. Hill has suggested, to see if we could not improve the roses that we shall grow in this country to be true American roses such as will withstand our winters and summers. I shall continue in the future as I have in the past, if I am spared, to strive to improve the rose in American gardens. Mr. Hill and gentle-

men, I thank you for your kindness. (Applause.)
PRESIDENT PIERSON: Gentlemen, I want to read to you a letter that carries with it a tone of sadness and will be received by you with regret, and the Hubbard Medal has had a good deal to do with it. There were two roses, and there was a difference of opinion. The other rose was the "Radiance," a hybrid tea. In making their decision the committee went back to the introduction of the Crimson Rambler and what the Crimon Rambler has done for America, and the brilliant red flower masses that carried them beyond the hybrid tea for a man's garden. When your committee and your society went to Elizabeth Park this summer the beauty of that same rose "Radiance" as it stood in the garden was practically beyond description. I believe candidly that the "Radiance" is one of the most beautiful hybrid tea bedding roses; and the society then and there voted to Mr. John Cook, one of the finest old men of the business, a silver medal in recognition of his having raised the "Radiance." We asked Mr. Cook to be here. He wrote us this letter, which shows that the old gentleman would have been here if he could, viz.: "I would dearly love to be there, but I am eighty-seven years of age and subject to neuritis, and it is impossible for me to risk a journey, as every little bit of cold affects me. I attended the conventions from the beginning up to six years ago; but I have got to ask you to be kind enough to send it to me." message, and we have sent the medal to Mr. Cook. Those are his regrets to us.

# Work for the Month of October

By Henry Gibson.

THE FLOWER GARDEN.

As the notes are penned, the flower garden is in the height of its glory. The geraniums were never brighter, the begonias have become miniature forests, and the salinas are lines and circles of fire amid the sombre colors of approaching autumn. Tonight, Jack Frost may throw the first line of his advance guard across the land, and tomorrow there will be left only black ruin. When this occurs no time should be lost in cleaning off the old plants and bulbs planted for making a display next Spring. No manure is needed when preparing the beds for the bulbs, in fact it is detrimental to their future welfare. In heavy soils a layer of sand placed beneath the bulbs would be beneficial. If the soil is very dry when planting is done a good watering will greatly assist, the bulbs making roots and becoming established.

THE PERENNIAL BORDER,

The work of rearranging and dividing the occupants of the hardy border should be proceded with apace, so that the plants may re-establish themselves before severe weather arrives. When dividing the old plants it is a good plan to force them apart by placing two digging forks back to back and forming a sort of lever. Less damage is liable to be done to the roots by this method than when they are severed with a spade. While on this subject it might be well to mention a late flowering perennial that is not seen as much as it merits. This is Salina Azuna Grandiflora, a plant growing five or six feet tall and certainly of a pleasing shade of blue. When massed and properly staked up, as the writer saw it last fall, it certainly is worthy of a place in any collection.

Dahlias and Cannas should be lifted as soon as frost has blackened the foliage. The former keeps well when wrapped in old newspapers and placed in barrels and stored in a cool cellar. Canna roots should be lifted with a nice ball of soil adhering and stored on shelves in a frostproof shed or cellar. Under the bench of a carnation house is a good place if one is available where there are

no heating pipes and free from drip.

#### LAWNS.

There is a marked difference in the growth of the lawn at this writing, compared to what it has been all through the summer. Mowing need not be so frequent now, and ere the month is out should be discontinued. The weather, however, will be a deciding factor in this, should a warm spell occur the grass may take on a secondary growth, which if neglected will have to be paid for with interest next spring. Grass that has been allowed to stand over winter takes on a wire-like texture and is very difficult to cut. Moreover, it leaves a yellow unhealthy appearance behind it. Edges of bed and walks should be neatly trimmed before operations cease for the season. The present is a good time to relay turf. If the work is pushed ahead the edges of the sods will have a chance to knit together before the winter overtakes us.

#### THE VEGETABLE GARDEN.

Now that severe frost is inevitable it would be well to draw the soil well up round the stems of late cabbage and cauliflowers. This will help to keep them quite late. Cauliflowers should have the leaves drawn over the heads, to protect them from frost and rains.

#### CELERY.

Just how to keep celery through the winter in the best possible condition is a problem that nearly all gardeners have to contend with. One of the best methods that we have seen is to dig a trench about two feet deep, four feet wide and long enough to accommodate the quantity of celery to be lifted and stored. Over this trench is erected a span roof, of boards, with air vents here and there. The root covered with straw and then a foot or more of earth placed on top. Celery lifted and stored in a structure like this is kept well all winter.

#### LIFTING AND STORING ROOT CROPS.

Carrots, beets and parsnips, should be lifted during favorable weather and stored away for the winter. Do not let them lay round on the garden to the drying influence of sun and winds for any length of time. The quality is not improved by such treatment.

#### THE GREENHOUSES.

A close watch should be kept on the night temperature of the rose house. Though the nights are considerably cooler now, the sun during the day is still strong and the thermometer is bound to run up. Have the night temperature just a few degrees above what it should be in mid-winter. Too great a difference between night and day temperatures is not conducive to the welfare of the roses. Turn on the heat to offset the difference that the cooler nights make and gradually work the night temperature down to a normal one.

A weakened condition of carnation plants caused by too high a temperature is hard to overcome with the short dark days of winter drawing near. In spring it wouldn't matter so much, but at this time of the year keep them as cool as possible, a little too low is better than too high. As long as the mercury plays round the 50 mark at night one isn't far wrong. Cleaning off yellow leaves should be attended to as should disbudding and removing the small side shoots. Watering should be done carefully and only when really needed. Syringing should be done as early in the morning as possible to allow the

plants to get dry before night.

Feeding of chrysantheniums should be discontinued as soon as the buds show color. No good purpose is served by giving stimulants when this occurs. In fact we believe that when carried on too long feeding has a tendency to cause damping of the blooms at an early stage. Watering should be no slip shod operation in the Mum house at this time of the year. Let it be done as early as possible and only as required for as the plants finish less water is taken up. All superfluous water should be dried up before nightfall. A heavy humid atmosphere is not what is wanted as the moisture will condense on the petals of the expanding flowers and cause them to damp off. In the event of a spell of dull, wet, heavy weather, a little heat in the hot water pipes with a crack air on all night will help to carry away surplus moisture. On the other hand a light covering of whitewash on the glass will prevent scorching in case the sun should be unusually strong during the day.

Cinerasias are now in vigorous growth and should have every attention from this on. A low temperature and fullest light at this season is what cinerasias delight in. Particular attention should be given to ventilation on warm dull days to prevent soft flabby growth. Give them a shift into larger pots before they become pot bound. Regular fumigation is necessary to keep down queen fly.

Cyclamen, which have been grown in cold frames all summer, should now be brought indoors. A light, airy position near the glass, with a temperature around 56 degrees at night's, suit cyclamen admirably. Alternate applications at root and weak liquid manure water is very beneficial, especially if the pots are full of roots.

#### QUERIES and ANSWERS

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.
You are invited to contribute questions, and answer others.
Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.
We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.
Nothing will tend to better fellowship than helping each other.

Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

Has any reader of the Chronicle ever grown the Princess of Wales Violet or any other single flowering kind in a cold frame successfully? If so, would they please give their methods?—S L., Penn.

There is a wet place in one of our roads, which we cannot seem to repair. Can you suggest the cause and remedy?-H. C., Conn.

Undoubtedly there is a spring hole or something of the sort which is causing the trouble. The only and best way to remedy such a condition is to dig up the road where you notice the moisture; dig down until you are sure that you are at the seat of the trouble; then la ya tile drain to your catch basin line. If you do not have catch basins, run the tile out to where it will give you no trouble. In filling up the hole use plenty of rock and sand; the sand must be clean and free of all organic matter, for if it is not it will cause the road to settle.-W. W. Smith.

How is run-of-the-crusher, for road building?—H. C., Conn.

Run of the crusher is very good if it does not contain too much fine powder, especially for a middle or top layer of macadam roads. You have a very good binding material here, and it often is quite a saving, as it is much cheaper than No 1 or 2 stones, and answers the purpose just s well.—W. W. Smith.

#### ORCHIDS

We are Specialists in Orchids, we collect, grow, import, export and sell orchids exclusively. If you are in the market for Orchids we solicit your inquiries and orders. Catalogues and special lists on application.

#### NEWPORT FLOWER SHOW.

The flower show of the Newport Garden Club and Newport Horticultural Society, which was held August 13, 14 and 15 at "Belcourt," was a decided social success. and goes on record as being the best conducted affair of its kind ever held in Newport.

"Belcourt" is the residence of Mrs. O. H. P. Belmont, and its spacious carriage house. court yards and the lawn with its shady nooks, proved to be an ideal place for the affair. The Garden Club, which is composed of the summer colony, financed the layout of the grounds and employed experts for the various branches of the work, with Arthur Herrington, of Madison, N. J., as manager, aided by a committee from the Horticultural Society.

premium list, gladoli were most extensively exhibited, B. Hammond Tracy making a grand exhibit, which was judged the best feature of the show and winning a silver cup from the Garden Club, also a silver medal from the Horticultural Society.

A silver cup for the second best exhibit was awarded to J. Lewis Childs for an unusually attractive display of gladioli.

The Stumpp & Walter Company cup, for a collection of vegetables, was won by J. B. Urquhart, gardener for R. L. Beeckman. Another cup, offered by R. & J. Farquhar & Co., for best display of hardy perennials, went to the Palisades Nurseries.

The best competed class was one for six vases of outdoor flowers tastefully arranged, there being nine competitors making an excellent showing. James Bond, gardener for Mrs. H. M. Brooks, was the first in this class, and Daniel Hay, gardener for Mrs. French Vanderbilt, was second.

In other important classes the following were the most successful exhibitors:

James Boyd, gardener for Vincent Astor, specimen greenhouse plants; William Mc-Gillivery, gardener for Stewart Duncan, hydrangeas; Edward Jenkins, Lenox, Mass. companula pyramidalis; Paul DeNave, Fall River, Mass., orchids; Fred E. Lewis, Ridgefield, Conn., grapes, peaches and nectarines; Arthur Griffin, Marion, Mass., gladioli; David Roy, Marion, Mass., fuchias; R. & J. Farquhai & Co., Chinese and Japanese lilies; Mrs. Jahn, New Bedford, Mass., dahlias; George L. Stillman, Westerly, R. I., dahlias; H. A. Dreer, water lilies; Wilson's Nurseries, coniferæ; F. R. Pierson, evergreens: J. Robertson, palms and dahlias; Gibson Bros., yellow flowers; Sisson & Thurston, dahlias; J. B. Urquhart, ferns, gardenias and roses; James Watt, tuberous begonias and glorianas; Oscar Schultz, bay trees; Daniel Hay, geraniums and gladioli; James Bond, groups of greenhouse plants: Hugh Williamson, miniature garden for which he received a silver medal.

The judges of the show were John T. Allen, A. S. Meikle and Bruce Butterton, of Newport; Robert Johnston, Southboro, Mass.; Maurice Fuld, New York, and Mr.

Cruikshank, Boston.

On the evening of the second day of the

Among the many things included in the | show Mrs. C. H. Hoffman, who is the leader of the Garden Club, provided a dinner at the Bellevue Hotel for the workers at the show, visitors and officers of the society. After an excellent dinner had been fully enjoyed, President MacKay called on the following gentlemen for remarks: Col. A. K. McMahon, A. Herrington, John Hay, Alexander MacLellan, Maurice Fuld, John B. Sullivan and B. Hammond Tracy. All speakers had praise for the show and its management, and predicted a still more successful one of its kind for next year. -Horticulture.

#### TUXEDO PARK (N. Y.) SHOOTING MATCH.

The outcome of a challenge from the assistant gardeners in Tuxedo Park, N. Y., to shoot a team of head gardeners was settled on August 20 at Kineraig when teams of six a side met to shoot for the honors. The weather being in its best behavior a very pleasant afternoon was spent. After the shooting the party became the guests of D. S. Millar, when an enjoyable two hours was spent.

When all was said and done the assistants took their beating in good part, and challenged the gardeners to a bowling match, which is to be settled at some future date. The score of the shooting was as follows, over a range of 50 feet, with

the possible score 750:

#### Head Gardeners.

Charles Costecki	655
Simon Hilmers	599
David S. Millar .	564

	*
Total	2,776

The head gardeners won by 47 points.

CONTESTANTS IN THE TUXEDO PARK, N. V. SHOOTING MATCH BLAWILL HEAD AND ASSISTANT GARDENERS.

#### NASSAII SOCIETY.

The regular monthly meeting of the Nassau County Horticultural Society was held at Pembroke Hall, Glen Cove, September 9, President Henry Gaut in the chair. Mr. Angus McGregor was elected to active membership.

for the monthly exhibits were Andres Messis, J. W. Everitt, Jas. Duthie and Angus McGregor. Awards as follows: 1 musk melon, 1st, Geo. Ashworth; 12 spikes mixed gladiolus, 1st, Alfred Walker; 12 mixed asters, 1st, Harry Jones. Harry Jones also received a cultural certificate for a vase of gladiolus, America.

The schedule for the Chrysanthemum Show on the 29th and 30th of October was

read and adopted as read.

Mr. J. W. Everitt will be manager of the Dahlia Show to be held at the Pembroke Hall Tuesday, October 6. Show open to public at 3:30 p, m,

President Henry Gaut made a trip to the New York State Fair at Syracuse, and was a very successful exhibitor there.

Exhibits for next meeting, October 14 tfruit), 3 bunches outdoor grapes, 3 distinct varieties; 12 apples in two varieties; 6 pears, HARRY JONES. 1 variety.

Corresponding Secretary.

#### CONNECTICUT HORTICULTURAL SOCIETY.

The society held its first meeting succeed ing the usual two months' vacation at the County Building, Hartford, August 28. As Mr. Huss was out of town attending the Park Superintendents' Convention, Mr. Hunt acted as chairman. The matter of appointing a committee of three to work in conjunction with the gardeners' co-operative movement was postponed until the next meeting. An article appearing in the June number of the GAPDENERS' CHRONICLE of America, entitled "The Gardeners' Co-operative Movement," by M. C. Ebel, was read to the members and received much applause. Some of our members showed their unusual ability in the art of producing asters and gladioluses of rare beauty and The spikes of the gladioluses were four feet long, having two dozen blooms to a spike of marvelous tints. The Chair named A. Righenzi, G. Boss and H. L. Ritson judges, and they awarded the gladioluses and asters, the exhibit of Mr. William H. MacKenzie, head gardener at the Sessions Greenhouses, Bristol, a first-class certificate. The three varieties of asters, great big beauties, the exhibit of Mr. Alfred Cebelius, head gardener for the Rev. M. W. Jacobus. also received a first-class certificate. exhibit of Mr. G. Ogren, asters and Shirley poppies, received a certificate of merit. Mr. Francis Roulier gave a most interesting account of his trip to Switzerland, giving his experiences there after war was declared. He had the time of his life trying to get home, but by his persistent efforts finally sailed from Genoa, Italy, arriving in America two weeks later. The meeting was well ALFRED DIXON. attended.

Secretary. Wethersfield, Conn., August 29, 1914.

#### THE HORTICULTURAL SOCIETY OF NEW YORK DAHLIA EXHIBITION.

The Horticultural Society of New York in co-operation with the New York Botanical Garden, will hold a dahlia exhibition on Saturday and Sunday, September 26 and 27, in the Museum building, New York Bo-tanical Garden, Bronx Park, New York City. Schedules of classes and premiums are now ready and will be sent on application to the culture.

COUNTY HORTICULTURAL secretary, George V. Nash, New York Bo-SOCIETY. tanical Garden, Bronx Park, New York City.

A symposium on the dahlia will be held on Saturday. September 26, at 2:30 p. m., in the lecture half. Museum building. Dr. H. H. Rusby, who has traveled extensively in the country where the dahlia is native, will make a short address on the home and surroundings of the dahlia. This will be followed by a discussion of the methods of present day cultivation of this flower, led by specialists in this line.

All, both amateur and professional, are invited to contribute exhibits and to take part in the discussion. Let us make this a notable gathering of dahlia enthusiasts. Certainly the dablia is a very popular flower and has hosts of admirers who can do justice to the presentation of their favorite.

GEORGE V. NASH, Secretary.

#### OYSTER BAY HORTICULTURAL SOCIETY.

The regular meeting of the Oyster Bay Horticultural Society was held in the Fireman's Hall August 26, with President John T. Ingram in the chair.

The special committee reported progress on the matter of destroying the caterpillar, and Mr. Nisley, of Farmingdale, gave a very interesting talk on caterpillars and their destruction.

Among the other speakers were Joseph Robinson, James Duthie, Alfred La Hodney and Arthur Patten. A very hearty vote of thanks of the society was extended to Mr. Nisley for his very instructive talk.

Mr. A. Yancechi was elected to membership, and there was one nomination for membership. The judges for the exhibits were as follows: Alfred La Hodney, Duncan Beaton and Frank Humphreys, and their decision as follows:

For society's prizes: James Duckham, 1st 6 gladoli; Frank Petroccia, 1st 6 apples: Frank Petroccia, 1st, 3 celery

Messrs. Garvin, Walker and Yancechi each received honorable mention for exhibits.

The exhibits for the September meeting will be 12 English cactus dahlia distinct, 6 onions, best 3 dishes of fruit, 3 of each.

F. KIRKHAM, Secretary.

#### NORTH SHORE HORTICULTURAL SOCIETY.

The annual exhibition of the North Shore (Massachusetts) Horticultural Society, postponed earlier in the month because of unfavorable weather, opened Thursday, August 27. A large tent had been erected on the grounds of Mrs. Robert C. Winthrop, offered by her for the purpose, and an interested public thronged it during the afternoon as well as in the evening, when a band concert was given. The pretty effects and general arrangement which charmingly displayed the products of North Shore gardens and hothouses, fields and meadows, were mainly due to John Chapman, the president, and other offcers of the society, and the advisory executive committee, which consisted of Mrs. W. Scott Fitz, Mrs. George E. Cabot and Miss Mary Bartlett.

Considering the backwardness of the season and the close competition resulting, the ceneral show was most creditable and beautiful. The riot of color and the exquisite and artistic arrangement of all departments created most favorable comment from the representative people in attendance. most gratified people present were the gardeners, who have labored so unceasingly to get results pleasing to their employers, who expend so much money each year on this department of their great estates. -Horti-

#### MONMOUTH COUNTY HORTICULTURAL SOCIETY.

The seventeenth annual exhibition of the Monmouth County Horticultural Society will be held at St. James' Hall, Red Bank, N. J., on Wednesday and Thursday, October 28 and 29. Prizes will be offered for exhibits of chrysanthemums, foliage plants, roses, cut flowers, carnations, fruits and vegetables. The exhibition committee is composed of George H. Hale, Philip Bonner, Wellington W. Kennedy, Harry A. Kettel, Percy A. Hicks, William Dowlen and Harry Collis. The judges will be William Turner of Mendham, formerly of Oceanic; James Kennedy of Deal, Adam Patterson of Saugatuck, Conn.; James Stuart of Mamaroneck, N. Y.; Peter Duff of Orange, and Mr. Burns of New Canaan, Conn. William Metzdorff is president of the society, Philip Bonner is vice-president. Harry A. Kettel secretary, Percy A. Hicks financial secretary, and George H. Hale treasurer.

#### NEW LONDON HORTICULTURAL SOCIETY

"A Busy Life in the Growing of Small Fruits" was the topic of an address by President Fuller, of the New London Horticultural Society, September 10.

The meeting was well attended. The president told his boyhood experiences among strawberries of fifty years ago. Also upon raspberries, currants and other small fruit, down to the present day varieties and culture, etc. An informal discussion followed the remarks of the speaker.

F. L. Childs, Flowerfield, L. I., sent a fine box of his "Snow King Gladioli" for exhibition. Renlies, the florist, staged several fine vases of indoor roses. Smith, the Mercer street florist, had a fine display of Several varieties of the table dahlias, helianthums, etc., were shown by private growers. It is hoped the society will be able to get the secretary, Mr. Ebel, of the N. A. G., from Madison, to speak at the October meeting on "The National Co-operative Movement," of interest to gardeners especially.

#### MASSACHUSETTS HORTICULTURAL SOCIETY

The exhibition of children's garden products at Horticultural Hall on September 5 and 6 brought out an immense entry. Nothmg like it had ever been seen in Boston before. The flowers and vegetables were not so numerous, but vastly better or quality and more artistically arranged than a year ago. It exhibitors grow as much another season it will take the resources of Horticultural Hall to accommodate them. The attendance of both adults and chil dien was very large all the time the exhibition was open.

The dahlta and truit exhibition held at Horticultural Hall on September 12 and 13 was one of the best ever held. In the truit section the peaches, pears, apples, plums and grapes were unusually fine. Dahlias were of better quality than in previous years. Long-stemmed flowers were shown by George B. Gill, of Melford, were superb. the flowers being of immense size. Some of the leading exhibitors and prize winners were Geo, H. Walker, E. W. Ela, W. V. Hathaway, F. L. Pinkham, Miss Fanny Foster, W. Whitman (M. Sullivan, gardener). Parker H. Mansfield & Son, W. H. Symonds, Mrs. Q. M. Tayle, E. F. Duryea, W. C Winter, George L. Stillman, Mrs. F. Dodge, Mrs. E. M. Gill and George B. Gill.

Fottler, Fiske, Rawson Company had a fine collection of gladioli and dahlias. Eastern Norseries made an extensive show of hardy herbaceous perennials. William Nicholson received a certificate of merit for varieties of Buddkia variables. The fol-lowing varieties of dahlias were the best noted in their respective classes:

Fascination, Conquest, Country Girl, William Marshall, Mrs. F. Jeffries, Mrs. Douglas Fleming, Dorothy Harves, Olympia, Marathon, Suzanne Cayeux, Mrs. H. Randle, F. W. Bellowes, Golden Crown, Crystal and Empress.

Show and Fancy Duchess of Albany, Christy, Estelle, Eric Fisher, Dreer's White, General Miles, Flore de Paris, Le Colosse,

Alice, Emily, H. W. Rawson, Captain Black., Peony-flowered Geisha, Governor General, Pocahontas, King Philip, Dr. Perry, J. B. Walker, Bertha von Suttner, Queen Esther, Osceola, Milady, Miantimoni, Excelsior,

Decorative Le Grand Maniton, Santa Cruz, Dorothy Flint, Yellow Colosse, Souv. de Gustave Douzon, D. M. Moore, Royal Purple, Jeanne Charmet, Delice, Mrs. Alice Longworth.

Single Newport Pink, Newport Cheer, Newport, Dandy, Beach Bluff, White Cloud, Dauntless, Coquette, Gladys, Newport Angel, Odin Woburn.

Pompon—Alwine, Bobby, Belle of Spring-tield, Red Indian, Apple Blossom, Rachel, Ariel, Lady Blanche.

The annual fruit and vegetable show of the Massachusetts Horticultural Society will be held on October 3 and 4. The anmual chrysanthemum exhibition comes on November 5, 6, 7 and 8.

#### LAKE GENEVA GARDENERS' AND FOREMEN'S ASSOCIATION.

The Lake Geneva Gardeners' and Foremen's Association's gladiolus show was a great success from the point of view of both quality and variety. Coming so quickly after the midsummer sweet pea exhibition the number of exhibitors was not large, but a sufficient representation was staged to fill the large hall to advantage. The competition in the classes of five spikes each and ten varieties of three spikes each, the latter for the Stumpp & Walter cup, was very keen. The entries for the collection of best gladioli, one spike of each, for the Kunderd medals, brought out a fine lot of seedlings and standard varieties. Joseph Krupa, gardener for N. W. Harris, staging 132 varieties. Some beautiful varieties of Primulinus hybrids and ruffled typts were shown by the several exhibitors, the former, we believe, having a great future. Conspicuous varieties shown included the following:

Kunderdi Glory, Mrs. F. Pendleton, Chi-

cago White, Ida Van, Pride of Goshen, White Glory, Governor Hauley, Mrs. A. E. Kunderd, Lily Blotch, Little Fawn, Peace, War, Niagara, Panama, Rochester White, Attraction, Corsaire and Mrs. F. King.

In the competition for the best collection of gladioli, J. Krupa was successful in taking first honors. In the Stumpp & Walter cup competition, 10 varieties, 3 spikes of each, first prize was awarded to Mrs. F. T. A. Junkin, N. W. Harris was second with a very creditable display.

Other awards for excellent exhibits were

as follows:

J. J. Mitchell (E. Johnson, gardener); E. F. Swift (R. Sampson, gardener); Mrs. C. Seipp (E. Johnson, gardener). Special awards were made to J. J. Mitchell, N. W. Harris, T. J. Letens and J. H. Moore for displays other than gladioli.

WM. H. GRIFFITH, Secretary.

#### UNCLE IKE ON THE INITIATIVE.

The only way beneath the sun To get a piece o' labor done, To build a fortune or a fence, Or tear 'em down, is to commence.

Nigh all the jobs that don't get done Are those that never are begun; Comparatively mighty few We see begun and not put through.

Most people whom we say have failed Are like a ship that's never sailed; They claim that all their plans went wrong

They never got that far along.

For nothing can go wrong or right, Go in too loose, go in too tight, Come out too big, come out too small, That doesn't come or go at all.

And therefore, I may farther say. You'll always find the likeliest way To get your rightful recompense For bein' done, is to commence, —John Brown Jewett.

#### ADVANTAGES OF FALL PLANTING.

The proper time to plant any kind of tree is when it can be done well, either in spring or in fall. Because of its special convenience, fall transplanting of hardy vigorous, well-rooted trees that have been grown and wintered in the open, without protection, is becoming more and more extensively practised in most localities, says a well known nursery firm.

Fall planting should be regulated by conditions rather than by date; as long as the ground is damp and free

from frost transplanting is safe.

The latter part of August and the whole of September are the proper fall season for transplanting most kinds of evergreens.

October and November are desirable months for transplanting deciduous trees. The general rule for hardwoods is to transplant as soon as the leaves begin to color. By removing the leaves, the work may be done somewhat earlier if necessary.

Land which is better adapted to the growing of trees than to any other use is often too wet to be planted easily in spring, but may be satisfactorily planted in fall. In dry, wind-swept places fall planting is not desirable. In some regions there is more moisture in fall than in the months immediately following the spring planting season; this is a great advantage. Where it is not so, unless the ground is naturally moist, the importance of

available water or mulch must be remembered.

The technical basis of fall planting rests on a physiological fact, demonstrated by a long series of experiments which proved that root growth still continues after the leaves of deciduous trees have stopped growing and the evergreens have put on their protective winter covering; this root growth continues till after the ground freezes. It is easily seen that the roots of trees set out in autumn get well established, if the planting is successful. They thus get an early start in spring, and much time is saved. It has been noticed frequently that trees successfully transplanted in fall make a better growth during the following summer than those equally well set out in the intervening spring.

Vegetation is of course more active in fall than in spring, and there is consequently more evaporation in fall. Fall planting, therefore, is most successful only when plenty of moisture is assured, or some form of temporary protection from drying winds and sun. It can be well done where the ground is naturally moist (or when damp weather prevails) or where the trees can be watered. The ground near the plants should be covered with very strawy manure or leaves to prevent the "heaving" caused by alternate freezing and thawing. This heaving is especially likely with very small plants in wet, heavy soils.

Underplanting of an existing wood and planting in brushy places are both generally successful, owing to the protection afforded by the larger growth.

# Now Is The Time To Plant Hicks' Guaranteed Shade Trees

THE days are get ting damp and cool. It is much better for the trees to be handled now than in the hot, dry weather—and if planted now, they will be well established by next spring.

We have a wonderfully fine lot of Norway Maples, twelve years old 0 to 8 inches in diameter, with 18 feet spread.

Their beautiful, dense green foliage makes them about the best shade tree you can plant. They are good drought resisters.

And remember: if any of our stock dies, we will replace it without cost to you

This unusual guarantee we have long been making because we know so well the superior quality of our stock.

We have shipped trees 1,000 miles, and they have all lived.

Send for our new bargain list. It will give you an opportunity to select now, right at the best time of the year, the best nursery stock at two-thirds to one-half its real value.

# Extra Quality Genuine Varieties Fair Prices

HE stupendous tragedy of Europe has demoralized the bulb-business in Holland, and those looking for really high grade bulbs, should exercise great caution this season, when purchasing their bulbs.

While bulbs are usually assorted and shipped from Holland during August. September, the conditions then prevailing were so turbulent that we decided to have our growers select and pack OUR bulbs after the country had once more settled down to regular routine, which has been possible during the past few weeks.

We therefore only received our Holland bulbs on October 14th last and they prove to be of our usual high quality. Of course, most of these bulbs were imported by us ON OR-DERS for our exclusive trade, but we have a few thousand of some varieties which we now offer to gardeners or their principals (we do not sell to the wholesale trade).

To induce those interested to try some of our high grade bulbs and compare them at flowering time with bulbs obtained elsewhere, we offer this fine stock at a great reduction from our regular prices for quick orders. Even if you have already bought all you need, it will pay you to try just a few of ours.

All our bulbs are guaranteed true to name

# The United States Botanic Gardens, Washington, D.C.

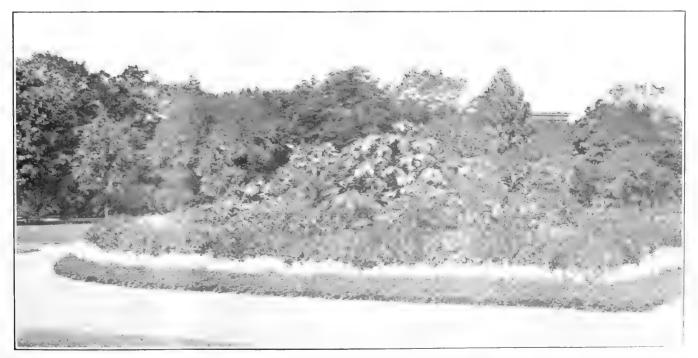

The old Botanic Gardens, nestling at the foot of the Capitol of the United States, the pride of the late William R. Smith, the first superintendent, and which may soon be given acreage in beautiful Rock Creek Park, for there is a strong movement in Congress to bring this about, were conceived by George Washington and are all that remains of a grand scheme of a national college and a national church. It was he who selected the site which they now occupy, and this in face of the stubborn opposition of one David Burns, who wanted this part of the city for himself. In 1822, a botanical society was formed and some planting was done on the dryer portions of the reservation. This society published what is now a very rare book, entitled Prodomus Columbiana, in which was contained a list of the plants in the District of Columbia.

To this collection, John D. Breckinridge, one of the foremost botanists of his time, added large quantities of interesting material. In 1850 Congress made an appropriation for the building of a conservatory and at about this time the plants that had been collected by the Wilkes Expedition, on a trip around the world, which had heretofore been placed in a greenhouse in the Patent Office Square, were placed within the gardens. Mr. Breckinridge was employed to look after the gardens and with him was associated Dr. Asa Gray, an expert botanist. Lack of funds stunted the growth of the gardens, for dur-

ing the years from 1851 to 1854 all expenditures were paid from the funds accredited to the Wilkes Expedition. For a number of years previous to this time influence was brought to bear on Congress to properly appropriate moneys for the gardens, and it was mainly through the efforts of the late Hon. James Alfred Pearce, then chairman of the Joint Library Committee of Congress, that the national body in 1855 enacted legislation "For the support of the public greenhouses, including the pay of horticulturist and assistants THEEE THOUSAND DOLLARS." Great credit indeed must be given to Mr. Pearce, for the Library of Congress, including the Botanic Gardens, the Smithsonian Institution, the Coast and Geodetic Survey, and our exploring and scientific expeditions, all experienced his fostering care and found in him an advocate and a friend.

It was during these troublous times of the garden's life that the late William R. Smith began his great work, for it was in the year 1853 that he assumed the title of superintendent. At that time, at the best, the gardens were for the most part a miserable ague-breeding swamp, the filling in of which required some 500,000 yards of material for the first operations. The work was necessarily slow, but the results have proven themselves well worthy of the labor.

The efforts of Mr. Smith are well known to every stu-

EXOTIC BED, U. S. BOTANIC CARDENS, CONTAINING MANY VARIETIES OF TOOLS AS A STANDARD PROMINED.

LIGHT.
THEW Y

dent of horticulture for through them he has been rightfully styled "The Father of Horticulture." To him much credit is due for the present beauty of the gardens—it was his life's work; he was successful and the gardens themselves stand as a fitting memorial.

The gardens, through their growth, soon became a popular place for students, not only of our craft, but those who assayed to become physicians, chemists, and members of kindred professions, and they obtained much knowledge of the science of botany. This interest is still maintained with the possible exception of the medical students, for less attention, it is said, is now paid to botany in the medical colleges. Their places have well been taken by high school students, the number of which increases annually.

Let us pass by the earlier days of the gardens' history and call upon George W. Hess, the present superintendent, for guidance through the grounds. Mr. Hess needs no introduction to the craft, yet no article based upon this subject would be complete without some reference being made to him.

Mr. Hess was born in the Capitol City about forty-nine years ago. At the age of sixteen he began the study of the business under the tutelage of the late John Saul. After that time he worked for a number of florists, was associated with Edward A. Mosely, of Kenilworth, D. C., specializing in the production of violets and carnations, and at that time the flowers of these varieties which they supplied were the best to be had in this locality. During the administration of President Harrison, Mr. Hess was connected with the Department of Agriculture, and later he connected himself with the late Mr. Doogue, when the latter was in charge of the Public Gardens in Boston, Mass

Mr. Hess later specialized in Chinese and other foreign vegetables, many of which are produced at the Gardens today, and he is able to name each of them in pure Cantonese. A disastrous fire caused him to look for employment in other fields and being familiar with public parks and their administration, and listening to the counsel of friends, he took the civil service examination for employment under the Federal Government. Much to the surprise of his examiners he obtained a rating of 100 per cent. as a specialist in the growing of foreign plants and 98 per cent. in general gardening; marks never before or since equaled.

Having met Mr. Hess, let us proceed through the gate and into the reservation at the southern part. We must stop to admire a fine specimen of the "Tall Cedars of Lebanon," so often referred to, and to the left a magnificent bed of grasses, containing about fifty varieties including arundo donax and pennisetum, with a contrasting border in which is contained a few coladiums. Nearby are the geranium beds, with blooms of rich red and pink, which must be seen to be appreciated.

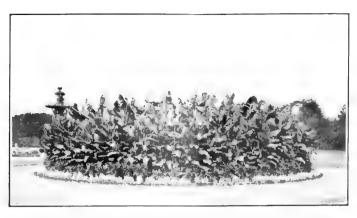

On the other side of the bed of grasses, and near the center of the great conservatory, is the fiscus bed of about twenty varieties, including ficus elastica, ficus panderatua, and many other equally fine plants of this family. This is bordered with hibiscus.

Going down the walk towards the main conservatory we find the exotic lily pond, at this time in full bloom, with a specimen papyrus antiquorum, the grass from which the ancient Egyptians made their parchment paper and which was gathered from the waters of the Nile for that purpose, in the center. Gold fish darting in and around the plants add color to the scene, and this spot is most popular with the juvenile visitors.

As we approach the houses we come in view of the rockery which contains all kinds of hardy herbaceous plants, perennials and ferns that will live out of doors during the winter in this locality. This in itself is worth

A COLLECTION OF SEVERAL VARIETIES OF YUCCA. BED OF GERANIUMS IN FOREGROUND WITH BLOOMS OF RICH RED AND PINK. A CEDAR OF LEBANON TREE TO THE RIGHT.

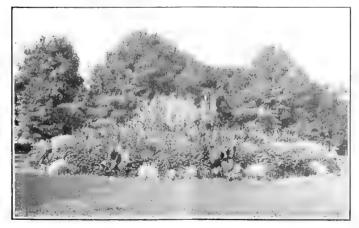

BED OF BANANA PLANTS WITH GLANT CANNAS IN FORE GROUND SURROUNDED BY BORDER OF CROTONS AND AN EDGING OF DWARFFD BON.

a trip of many miles to see when at its best in season. At the door of the conservatory is a full grown cassia tree planted by General Grant during his term of President of the United States and from here can be seen the \$500,000 monument being erected to his memory and which will soon be completed.

As one enters the conservatory his first view is of an umbrella plant at the right and a magnificent specimen at the left of Attalea Excelsior with leaves spreading full thirty feet from the trunk to their tips. Near here is the Travelers' Tree of Madagascar, from which the weary natives of that country obtain water while traveling through the dry sections; and the Royal Palm of Florida, Oreodoxa Regia. Passing into the east wing we find the tree fern Cibotium Regalii beneath the spread of which a half-dozen people could obtain shelter from the rays of the sun in its native country. There has also been planted in this wing coffee trees, Cinchona Superubii, from which quinine is obtained; and the gigantic banana tree, a treat to Northern eyes for at the time of this visit great bunches of fruit were hanging from its branches.

Were one Robinson Crusoed within this conservatory little difficulty would be encountered from lack of food, or medicine, or of plants from which clothing, etc., could be made, for in addition to those above named, there grows with all the hardiness of its native soil Pandanus Utilis, from which the natives of Mauritius make material for clothing for bags and sacks, and this they even use in the erection of their homes; Camphora Officinalis, warranted to keep away moths as well as being valuable in the chemist's shop; Monstera Deliciosa, a bread fruit rightfully named for its fruit has a very delicious flavor akin to the pineapple. Should we require poison for any

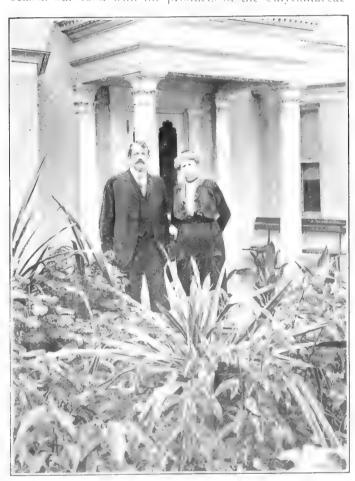

A BED OF MANY VARIETHS OF GRASSES WITH SOME CALADIUMS IN BORDER.

reason we have Lut to tap the Hottentot ordeal poison tree of the species Toxicophlaea, for this is the tree by which the Hottentots sought to tell the guilty from the innocent. It was their belief that the innocent could readily eat the fruit of this tree without being stricken, but needless to say no one ever passed through the ordeal alive. These natives also used the sap of the tree to tip their spears and arrows with deadly poison.

In the octagon house at the east end of the main conservatory is the Strelitzia Regimoe, the bird of paradise flower of South Africa, which unfortunately was not in bloom, and many other useful and ornamental trees and ferns, all brought from other climes.

Passing into the west wing of the conservatory we are enabled to complete our collection of edibles—we can season our food with the products of the Calycantaceae

SUPERINTANDENT OF THE ROLAND CASHAS CLOWN HESS AND MRS HUSS INTRONE OF HILLRESHOLVED CASHA RESHOLVED

callspace of Cincar enum Zeyraneum comanion and if we understand Chinese we can get some sort of food from the Wampie tree and also the pleasant tasting Lichee nuts. Here also are a wild date palm and Sago palm from far off Japan. In this wing later in the season will also be stored the hundreds of palms and ferns which now beautify sections of the grounds, but which will not withstand the onslaughts of winter in this climate.

Having completed a round of the conservatory and its several wings, we come to the front of the gardens and there obtain a view of a wonderful fountain designed by the famous sculptor, Bartholdi, for exhibition at the Philadelphia Centennial in 1878, and which was later brought to Washington and placed in the Gardens. This is a most wonderful piece of work and this spot is the

mecca of thousands of art students annually. Within the huge base at the bottom is a large collection of hardy water lilies and myriads of gold fish are to be seen swimming about. (A photograph of this fountain is repro-

duced on our cover page.)

From the fountain is obtained a splendid view of the superstructure of the National Capitol, and to the right of the former a group of bannana plants which also bear fruit at the present time. Around this group is a collection of giant canna, eight to ten feet high, in full bloom and the whole is surrounded by a border of crotons and an edging of dwarfed box. On the other side is the exotic bed containing about seventy-five varieties of economic and ornamental plants brought from all sections of the globe.

The range of orchid houses holds one's attention for quite a period of time, for here is an excellent display of rare plants, many of which are in bloom. The Holy Ghost orchid, or Sanctum Spiritus, with a most excellent reproduction of a dove hovering above an altar, emphasizes nature's handiwork, and Cattleyas in profusion add their colors to the beauties of the surrounding plants. Another range of houses is devoted to the propagating and growing of ferns and so-called stove-house plants. These latter represent a wonderful collection of plants brought from warmer climates.

Within this reservation are many trees that have historical associations, some of them having been planted by Presidents of the United States and others by noted statesmen; there are varieties which have found a place in the world's history, and their study is most interesting and valuable along educational lines.

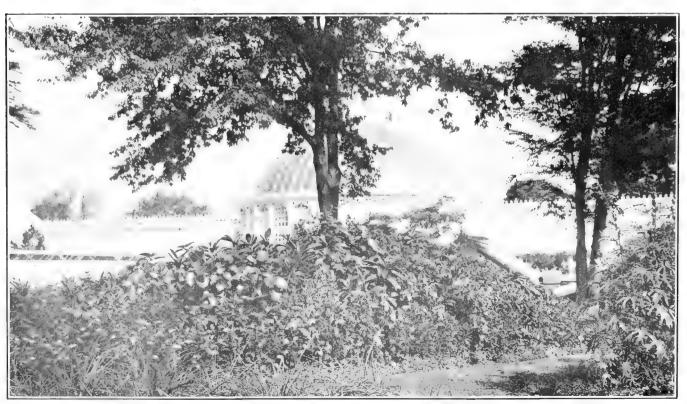

As has been found the case with other visitors, it required a full half day to see all of the wonders of the conservatory, the greenhouses and the grounds surrounding them, and there still remained a wide stretch across Maryland avenue where are located the offices of the superintendent and many additional greenhouses and places for the storage of such plants as cannot be accommodated during the winter in the grounds. Practically all of the trees, ferns and plants displayed in the Gardens, and many thousands that are distributed among the various government branches, for the beautification of public buildings and grounds, and for exchange with other similar parks, are propagated on this side of the fence. No attempt is made to grow flowers that are familiar sights in commercial establishments, attention being devoted entirely to the production of flowers and plants usually found on private estates and of the rarer varieties.

#### NOT ROOM FOR BOTH.

There's not room for the weed in your garden, And the flowering blossom, too; You can't have the noxious nettle, And the violet's lovely blue. For the weed will choke the blossom, And not all the sun and rain Will ever restore its beauty, Or bring back the bloom again.

You can't have the smile of sunshine, And the dark frown on the face: If you have the look forbidding, You will lose the smile's bright grace. And it is better to have the sunshine. And the welcome in the eye. Than the frown that is black and chilling And the clouds within the sky.

There's not room for the light and gladness. And the sweetness in the life, As well as the dark and loveless. And a heart that is set on strife. And 'tis best to be sweet and gentle, To be pure and good and kind, And to keep as a lasting treasure A sweet and loving mind. -Charterbox.

FIGUS BED CONTAINING ABOUT TWENTY VARIETIES, SAID TO BE ONE OF THE MOST COMPLETE COLLECTIONS IN THE UNITED STATES. THE BED IS BORDERED WITH HIBISCUS.

# PROPAGATION OF ORNAMENTAL TREES AND SHRUBS.

Ornamental trees and shrips are grown by different processes, but the ultimate ord is the same in each—the increase of the variety of species, writes M. J. Wragg, in *American Fruits*.

In ornamental trees, especially, we always grow those from seed wherever we can get the best results, but as a rule there are but few that we can get this way; consequently we employ budding or grafting.

We have been very successful in growing one variety of Japan Maple (acer ginnala) by seed, as the seed grown in this country seems to be very strong and perfect and we have had no trouble during the last few years in growing from eighty to ninety per cent. of seed.

So many of our best ornamental trees require so much nursing to get nice, well-grown specimens that we have employed during the last few years budding. To illustrate: If we want to grow Norway Maple or the redleaved variety (Schwedleri) or any other fine Maple, we plant out maple seedlings, bud them at one year old after planting and we always use for our stock beds from trees that have special characteristics of growth. As in the Norway Maple, there are some trees that are so much thriftier, up-right growing trees that we get our buds from these trees. In this way we can grow a uniform block or row of the Norway Maple; but if we depend on seedlings, many of them will be very crooked and unshapely.

In trees of rapid growth like the Soft Maple, Linden, Hackberry, White Elm, Catalpa Speciosa, etc., we generally plant out one-year-old seedlings. After they have been grown one year we cut then off at the ground. The following year they will make very rapid growth.

Early in the spring we are careful to remove all the sprouts from the stem except one, so that by fall of the year in which we cut them back we have tall straight stems which will make the body of our future tree.

I will mention in this connection the Oak, as I consider it one of the coming ornamental trees, and I believe our best results will be from planting our native acorns of our Scarlet, White, Red, and Pin Oaks, transplanting them at one year old from seed.

In shrubs we have to employ different methods to get the best results. I am now speaking as we grow them in

our nursery in a commercial way.

Take, for instance, the Lilac family. There is a large class of these that we grow from layering, which we do by taking the superfluous limbs as they sprout up from near the ground, make a small incision with a knife or other instrument on the lower side near the ground, just cutting through the cambium layer. When these are bent down and all are prepared, we then cover them with dirt all around the plant, covering from three to six inches, according to conditions. We do this along our large plants that we intend to dig the coming fall.

As fast as we dig these plants we trim all these limbs off, and, as a rule, they have all thrown out more or less rootlets. Even if they have only made a callous we save them, planting them out the same. In this way, from a row of common White, Red, or Purple Lilacs of 1,000 we often can get from 3,000 to 4,000 young plants for

lining out and vet have the parent bush.

This is the way that we grow what is known as the common lilac bushes, but if we want to grow nice, upright lilacs, with nice stems, we then employ budding. The last few years we have had good success in budding lilacs on the common Privet (Ligustrum Vulgaris), but we believe for this country that our best lilacs should be budded on Ash, as they make a stronger growth. I have

never found the growing from cuttings very successful. In most of our shrubs 1 prefer growing them from hard wood cuttings.

During the months of September and October I prepare my cuttings for some varieties. As soon as the wood has matured and the leaves will strip off easily or drop I consider them in the proper condition for cutting. I like to use cuttings about seven or eight inches long, tying them in bunches of 100 to 150, and keeping the base or the bud of each cutting the same way. As fast as cuttings are cut, and tied each day as cut, I put them in my storage house with the base down on the floor, where I keep it well wet so as to keep the base of the cutting in a moist condition. After I have prepared a quantity ahead I put them in the callousing pit out-of-doors, digging the pit about ten inches deep, putting the base of the cuttings up, covering it with about an inch of soil.

During the warm weather in September and the first of October these cuttings will callous very rapidly, and as soon as all cuttings are cut and treated in this way I then commence planting them in well prepared ground that has been plowed at least ten inches deep, subsoiled if

necessary.

I generally employ setting to a line, putting my rows three feet and six inches apart and the cuttings in the form from three to six inches, according to variety, pushing the cutting clear down to the top, then covering the top of the cutting with about an inch of dirt the last thing in October.

After the cutting patch has frozen in the fall, I cover these buds with manure to keep a warm, equitable temperature and keep the cuttings from heaving out by frost.

Now the varieties that we get the best results from growing hard wood cuttings are Spireas, Arguta, Van Houtii, Opulifolia, Reveesii, etc. The other varieties of Spirea, like the Colosa Alba, Colera Rubra, Watereri, etc., I think are best propagated from the layering system, or the division of the plants as they are taken up; however, for the largest classes, I think the hard wood cuttings the most preferable.

All varieties of Forsythia grow splendidly from hard wood cuttings, also the Tree Honesuckle, Syringa, Tam-

arix and other varieties.

Those that I recommend layering as the fastest and most economical way of producing young plants would be the Viburnum Family, common Snowball, Tree Cranberry and Dentatum. These all root readily and by laying the lower limbs of the bush down one can increase them very rapidly.

Of course, there are some hard wood cuttings that root more easily than others, but if the above methods are employed no trouble in rooting at least sixty or eighty per cent. of the cuttings will be experienced.

#### TOO BUSY TO READ.

He is a familiar type—the fussy, fretful man who imagines that he is about the busiest fellow in town.

He often dumps in the wastebasket unwrapped copies of business or technical magazines that contain valuable articles bearing directly on his problems. He fondly believes that he is too busy practicing to bother with what others are "preaching."

The trouble with this type of man is that he has not learned that the real executive is the man who so plans his work as to leave a reasonable amount of time for

reading and planning.

There are shoals and breakers ahead when the accumulation of new ideas ceases. The man who declares he has no time to read is unconsciously advertising his small caliber, his slavery to detail, his arrested development—Elliott "Impressions."

# Work for the Month of November

By Henry Gibson.

THE FLOWER GARDEN.

The chaotic appearance of the flower garden at this time of the year makes one almost despair of ever getting it cleaned up. The short dark days are, however, drawing near, and there is no time for these regretful feelings. The first thing in cleaning up the garden is to start a fire of dry leaves and debris that are lying around. Once the fire is got going all the old rubbish from the beds and borders can be piled onto it, and thus be easily disposed of. When the fire is burned out the ashes may be spread on the beds and previous to digging.

All beds and borders that are not to be planted to bulbs should be manured and dug over before the winter sets in. Especially is this so where the soil is of a heavy clayed texture, care being taken to leave the surface as rough as possible so as to allow the disintegrating influ-

ence of frost to penetrate as deeply as possible.

#### THE VEGETABLE GARDEN.

What has been said with regard to the foregoing applies with equal force to the vegetable garden. As fast as the various crops are harvested digging or ploughing should be proceeded with, and if deemed necessary trenching. Trenching is a process too well known to need description here, and especially to those who received their early training on the other side of the water.

Land that has been heavily manured for several years past would be greatly benefited by a good dressing of lime applied now. Land such as we are speaking of contains large quantities of valuable plant food in such a form as renders it unassimilable. Lime acts as a disintegrator; that is, it breaks down or lets loose as it were these chemical compounds so that they are readily assimilated by the active roots of the plants. It is possible by frequent application of lime to break up these compounds to such an extent that the soil becomes impoverished. Therefore apply lime cautiously and not oftener than once in three years.

On the other hand, land that is known to be deficient in any of the chemical elements that go to make up plant food should have these supplied, and there is no better time to do this than the fall.

#### THE FRUIT GARDEN.

The suggestions given with reference to the application of lime and fertilizers are also to be recommended for the orchard and small fruits. Raspberries should have the old canes cut away if not already done. No good comes of having the raspberry patch like the impenetrable undergrowth of a forest. Take the pruning shears and let in some light and air about them. They will then have a chance to get ripened up and stand the winter better.

#### SWEET PEAS.

It seems a far cry from the fruit garden to sweet peas, yet while on the subject of preparing for next season's work it would be well not to overlook next year's supply of these almost indispensable flowers. On many estates they are grown almost to perfection, and no doubt exists that this is only possible where thorough preparation and cultivation is carried out. Sweet peas delight in a deep and retentive, well enriched rooting medium. Such a condition can only be brought about by trenching and a liberal application of manure and artificial fertilizers. Do the trenching now before the ground freezes up. Just how much to trench depends on the extent to which these flowers are to be grown, but the

trenching should not be less than three feet wide and two feet deep.

### THE GREENHOUSES. (THE ROSES.)

Keeping the plants in perfect health should be the aim of the rose grower at this season so as to get them through the winter in as good a condition as possible. Overfed and overwatered plants are not the things to start out with, for such will undoubtedly damp the ardor of the most enthusiastic grower ere spring arrives. Extreme care should be exercised in watering, and only when absolutely needed. But to have the plants too dry is equally harmful. Feeding with highly concentrated fertilizers should be guarded against, as a soft growth is a thing to be avoided. Good liquid cow manure contains all the necessary elements in fair proportions, and is, we believe, second to none for feeding roses.

#### POINSETTIAS.

Few plants are more easily spoiled by uneven temperatures and an excess of moisture at the roots than are poinsettias. A night temperature of 60 degrees should be maintained and ventilation during the day should be carefully attended to. Feeding is in order when the bracts show color. Soot water greatly helps to keep the foliage dark green.

#### BEGONIAS, GLORE DE LORRAINE AND CINCINNATI.

This type of begonia which requires shade from bright sunshine during the summer months should now be accommodated on a shelf near the roof of a warm house and gradually inured to full sun. This will harden up the foliage and add very materially to their keeping qualities when used for decorative purposes. The removal of flower buds should be discontinued now and the plants will remain bright and attractive throughout the fall and early winter months. The persistent manner in which they keep on producing buds and flowers indicates their food assimilating propensities and to keep them in perfect condition they should be supplied with regular doses of liquid manure. As the roots are rather delicate strong stimulants should not be given.

#### CAMPANULAS,

They come in very useful for making a display in the spring when flowering plants are pretty much at a premium. Plants raised from seeds sown in the spring and planted out will have made strong crowns that will stand forcing next spring. Lift these plants, if not already done, so that they make new roots before freezing weather sets in. Give them suitable sized pots and use a good compost. Three parts good fibrous loam, well decayed cow manure, 1 part, and a five-inch pot of bone meal to each barrow load of soil makes a fine growing medium. Pot firmly, water thoroughly and place them outdoors until the frosts are severe enough to make protection necessary. Then place in a cold frame where they can stay until wanted for forcing next January.

#### LIFTING SHRUBS FOR GREENHOUSE CULTURE.

At the present time the gardener is being constantly reminded that he must keep expenses down, and he is expected to get respectable results at the same time. It is therefore up to the gardeners to fall back on their resources and rise to the occasion. Times are hard and, instead of discouraging one's employer and cause him to close down, help tide over the depression by brightening up the conservatory with some of the shrubs, etc., that have been forced and planted out two or three years past.

#### EREMURI IN SHRUBBERY.

To what advantage the giant Eremuri may be planted in the shrubbery and its adjacent parts is well shown in the accompanying illustration reproduced from a photograph taken at Kew in the early summer of the present year. The effects of a thin natural grouping as opposed to overcrowding is so well shown in the figure that little need be said on that point, though attention might well be drawn to the foil of trees, which assists to mirror into greater life and beauty the subject portrayed. In all these directions the illustration tells its own tale.

Another important lesson, equally obvious to the specialist if not to the ordinary gardener, writes E. H. Jenkins in Gardening Illustrated, is the shelter the shrubs afford for the Eremuri during the spring months. It is quite well known, of course, that these plants when starting into growth early in the year are at times liable to be injured by late frosts, hence the value of some such protection as that shown, quite apart from the picture-making effects such associations give to the landscape. Doubtless, similarly suitable positions could be found in many gardens, and by arranging the plants on the southwestern side of shrub groups protecting them from the biting winds of spring which are as dangerous and disfiguring as the frosts. The noblest of these Eremuri, as e. g., E. robustus, E. r. Elewesianus, and E. himalaicus, grow, when established, a great height, the first two being from 6 feet to 10 feet, or occasionally 11 feet, high, the last from 5 feet to 8 feet high. In the first-named the color is palest pink or flesh, in that last-named purest white, hence a Holly or something akin makes a good foil.

From Gardening Illustrated. EREMURUS ROBUSTUS AMONG SHRUBS IN THE ROYAL GARDEN, KEW, ENGLAND.

Their root-vigor, too, is proportionate to their imposing stature, as witness the rope-like thongs which, like the spokes of a cart-wheel, extend to several feet from the central crown. Hence, preparation of the soil might well extend to several feet, while spade or fork work should be dispended with in the immediate vicinity of the plants.

With such as Bungei (yellow), Shelford (bronzy yellow), Warei (salmon), and others, a less vigorous rootsystem prevails, with more stay-at-home and pliant rootfibres, hence for these soil preparation should be restricted accordingly. Those like Shelford and Warei, possessing bronze and salmon shades, and which, starting later into growth, require less protection from frost, are seen to the best advantage with the sun upon them. The best planting season for these Eremuri is September and October, and while all may be inserted 6 inches below the surface, it might be well to remark of such vigorous sorts as E. robustus that the plants occasionally force themselves to the surface, leaving a vacuum immediately below the crown. This upward movement is probably as much due to the peculiar crown-upon-crown formation which goes on year after year as to great vigor, and is not very apparent unless the examples are of exceptional strength, or have been some years in position. When it occurs, lifting and replanting are the only remedy.

E. H. JENKINS.

#### HERBACEOUS PERENNIAL PLANTS.

By J. Johnson.

Though the spring months are considered by some to be the best season in which to prepare and rearrange the borders and to plant out hardy perennials I believe that the work could be even more effectively carried out at this season. It is an advantage if the roots can be started in the fresh soil in autumn while the ground still retains some of the summer's heat and the plants become established before severe frost sets in. The colors and habits of the plants being still fresh and vivid in the memory rearrangement can be done with half the trouble, and as the pressure of work in other departments is not so great at this season as in the spring months planting might be done more satisfactorily now than if deferred.

Generally speaking perennial flower borders benefit by being overhauled at intervals of three years, and on each occasion the ground requires to be deeply dug, or better still, trenched. At the same time a heavy dressing of farmyard manure should be given together with a light dressing of bone meal. The plants are usually gross feeders and readily respond to a deeply worked and well prepared rooting medium. When planing the arrangement it is well to remember that though hardy perennial plants predominate this class of plant should not be grown exclusively if the best possible display of flowers be required over an extended period. While it is true that a selection of perennial plants could be made that would furnish flower from early spring until late fall, I think better results are obtainable by the introduction of some of the best half-hardy and annual bedding plants. These latter plants usually continue in flower months at a stretch while many of the most handsome perennials last but a few weeks.

In gardens where several such borders exist the object should be to avoid a sameness of things. Many gardens resplendent with borders of mixed hardy plants are too frequently disappointing because one border is typical only of its neighbor. The best gardeners avoid stereotyped methods of planting even to the extent of not using the same kind of plants in different borders, and in this way gardens become what they should be-gardens of

interest.

# Lawn Sprinkling Through Concealed Irrigation

By Laurie Davidson Cox.

The excessive cost of maintenance is one of the most serious problem which confronts the park builder in the climate of Southern California, writes Laurie Davidson Cox, landscape architect, Park Department, Los Angeles, Cal., in *The American City*. This is because the maintenance is continuous throughout the year, during practically all of which time artificial irrigation must be resorted to. Any eastern park official who has struggled with a much used lawn during an August drought will realize what ten months of such conditions must mean to us here in Southern California.

Four years ago when this department undertook, as part of a progressive park system, the problem of re-

ducing maintenance costs, the question of lawn irrigation was seen to be one of the chief features of the problem. In an attempt to reduce this item, recourse was had to a system making use of fixed sprinkler tops supplied by underground pipes. The system was worked out in this department under the direction of the superintendent, Mr. Frank Shearer, and proved very satisfactory. Today systems more or less similar are being widely used all over Southern Caliessive park system, the problem of redry is desirable. The most ingenious in the problem of redry is desirable.

UPPER ILLUSTRATION SHOWS UNDERGROUND PIPE SYSTEM IN OPERATION. LOWER ILLUSTRATION SHOWS IT INACTIVE.

Since the first use of the system by the Park Department here, there have been numerous new ideas brought forward regarding the form of the sprinkler tops and their arrangement. Some of these are of considerable complexity, such, for example, as the disappearing top for use in shrubbery and flower beds. This rises to a height of several feet to operate and drops below the ground cut of sight when the water is shut off. The simple fixed top is, however, the standard and a number of such tops are on the market. These differ principally in the amount of water which they distribute and the pressure under which they work.

The newer forms of tops are designed so as to withstand weight and hard usage, such as that given by horse and power motors. The earlier forms did not do so, and much breakage of tops ensued. The general principle now is to provide as a part of the top a protecting guard, such as the one now used by this department and shown

in the diagram. Others make use of a spring valve which closes when the sprinkler is not in use and causes the sprinkler to present a plain massive surface capable of withstanding a heavy thrust or pressure. On account of greater strength and toughness, brass or bronze is now frequently used for the material in these tops, rather than composition metal or cast iron, as formerly.

In using the system for shrubbery and flowers a greater variety of sprinkler tops is possible, as the top can be kept above the ground and may be of more delicate construction. For this work a sprinkler which distributes the water so as to leave the walks or other adjacent areas dry is desirable. The most ingenious form yet seen by

the writer is one making use of gas jets set slightly above the ground and arranged in the grass or curb border of the bed.

Besides the system making use of buried pipes and fixed sprinkler tops, there are several systems using pierced pipe which lie flush with the surface of the lawn. Of these the best known is the so-called "Skinner system," the de-tails of which are shown in Diagram Number Two. The system consists merely of a galvanized iron pipe (usually 34-inch is used) with

minute holes punched 16 inches apart, laid flush with the surface of the ground and provided with a patented union and handle which permits the pipe to be rotated without leakage. Such a system will sprinkle splendidly a strip of lawn twenty feet on either side. The system is especially good for flower and shrub borders or for long, narrow strips of grass such as street parkings. It is much cheaper to install than the underground system and distributes the water in a finer mist. It is, however, more trouble to operate, and the labor cost of irrigation is probably twice as great as with the underground system.

The underground system as used by the Los Angeles Park Department consists of a series of pipes laid in radiator circuits 12 to 15 inches deep in the ground, having stand pipes with attached sprinkler tops placed flush with the surface of the lawn at intervals of from 15 to 20 feet. The grass soon covers the tops, so that the system when inactive is absolutely invisible. The tops do not

interiere at all with the lawn mowers, being so laid that the blades pass over them. The spacing of the sprinklers depends on the available volume of water and the pressure and the nature of the top used. A circle whose diameter is the diagonal of a 20-foot square seems in practice to be the maximum area over which water can be uniformly distributed from a single sprinkler top.

Sprinkling systems with underground piping were in use before the development of the Los Angeles system, but all made use of the principle of hose sprinkling with the constant diminution of pressure proportionate to the length of hose and number of sprinklers. The Los Angeles system differs distinctly in this respect, and therein lies the secret of its success over all earlier systems. The principle involved is merely that of the application of pressure to a body of water confined and motionless. The feed pipe forming a complete circuit is of sufficient capacity to furnish all sprinklers with their maximum capacity, and so when the valve is opened and pressure applied the pressure and distribution are the same for each sprinkler.

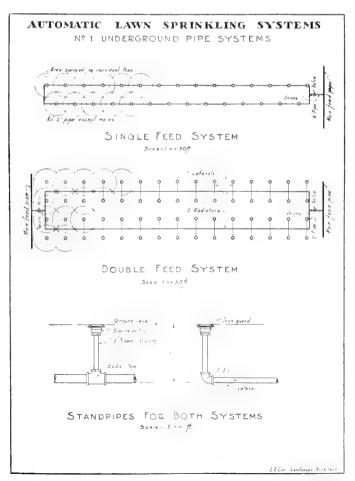

The first installation in Los Angeles was made in Central Square and the single feed system was used. There are eleven circuits in this park and each carries 36 half-inch Wilgus sprinklers covering an area of approximately 17,000 square feet. The total area of Central Square is 5 acres with 4.3 in lawn. An attendant waters this park thoroughly with the automatic system in two hours at a cost of about 70 cents. As it formerly required two men the entire day to perform the same work at a cost of \$5, the saving effected is \$4.30, or over 80 per cent. Also the expense for the purchase of hose is eliminated. This system has been in operation for over three years and has given perfect satisfaction. The only danger is that the workmen, unless carefully watched, will give

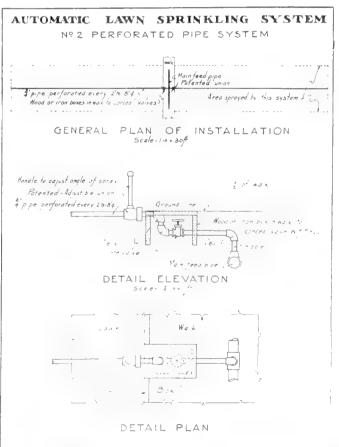

the lawns too much water. Within the last two years some 40 acres of new lawn in Los Angeles parks have been put in with this system. The Skinner system is also employed on areas of such shape as this system is best adapted to, and also on our flowering and herbaceous borders. All new lawn now put in by this department is provided with one or the other of these systems, and it is planned eventually to replace our present hose systems in use on the old lawns with these systems.

Requests for the details of this system have been received from many sources. The system is simplicity itself, the only secret being not to overload the supply pipe. In using this system in heavy soil, under drainage should be provided, and in a section having frost in winter a provision should be made for draining the system in winter and the sprinkler tops should be plugged or replaced by caps.

The cost of installation is from \$400 to \$800 per acre, according to conditions. If galvanized or dipped pipe is used, the life of the system should be fifteen or twenty

# Park Department Organization

By Frederick Law Olmstead.

(Continued from September issue.)

Probably the most perplexing and troublesome set of relations to fix between the various parts of the organization are those between the people in charge of playgrounds, etc., and the general maintenance and operating forces. It is obvious that for dealing skilfully with the children and others who resort to playgrounds, baths, social-center buildings, and kindred recreation facilities, quite a different set of people are needed from those fitted for the ordinary work of the physical maintenance and improvement of parks, playgrounds, etc. It is obvious also that these people need to be directed and controlled by a central staff-department expert in this special class of work. The personal requirements for efficient service in this work are peculiar and exacting in respect to tact, imagination, sympathy, firmness, and common sense, as well as in respect to certain kinds of technical training; and the job of creating and maintaining an efficient corps of such people by a process of selection, elimination and wise control calls for a high order of ability, as well as for special training and experience, in the head of the department. There is needed also a very close and intimate relation between the head of this department and the instructors and other workers who are actually dealing with the public in the various playgrounds.

Most of the work for the supervision of which other staff-departments are responsible can be done to advantage by employees who are working under a local division foreman, who are responsible to the staff-department only through that division foreman, and who are transferred at the discretion of that foreman from one class of work to another. This is clearly impracticable in the case of the playground instructors. They must be directly and absolutely under the orders of the head of the recreation department, just as a transit-man assigned to work in any park must be directly under the orders of the head of the engineering department and not, like the construction gang for which he sets the stakes, under the orders of the division

foreman.

On the other hand, it must be borne in mind that the boundaries of the field of work for which a playground or recreation department might properly be made responsible are extremely vague with endless interlocking ramifications. The whole park system exists for no other purpose than to furnish various forms of recreation for the public, and the business of educating and guiding the public to the full and proper use of the facilities provided, and at the same time preventing their abuse. calls for the constant exercise in greater or less degree throughout all the parks of the same qualities of tact, imagination, sympathy, firmness, and common sense, that are so peculiarly necessary in playground instructors. It calls for the exercise of those qualities in connection with various sorts of technical knowledge, as in determining just how far and where the public can be encouraged or permitted to use the lawns for walking. for picnics, and for games, without destructive injury that would actually reduce the net return of public recreation derived from the entire investment. The so-called policing of the parks is one aspect of this group of functions; but park policing cannot wisely be divorced from the business of park maintenance. Some cities have made the serious mistake of turning over the policing of their parks to the general city police de-

partment, whereas it can be done better and more economically by park employees responsible to the local division foremen. Generally, one man can unite the functions of a maintenance laborer and of a guard; at times in the larger parks and on the busy days men must be assigned to the sole duty of watching and directing the users of the park. It is the concentration of certain kinds of public activity on the playground areas and bathing-places, etc., that makes possible and justifies the further specialization of expert playground instructors and the like in charge of such places. There are many places in the parks where an isolated ballfield or a few tennis-courts or a few swings add materially to the recreation facilities, yet where there is not sufficient justification for stationing a playground instructor, and where the control of the public using these facilities must, for economy, be exercised by the same man who does the labor of maintenance.

In view of all these considerations, I believe the most satisfactory method of adjusting these duties and responsibilities is the following: There would be a staffdepartment of recreation under a thoroughly competent chief with an adequate staff of assistants. He would receive the orders of the board through and be responsible directly to the chief executive officer, the department being conducted under the supervision of and in consultation with a sub-committee of the board specializing on this subject. The department would keep a general oversight upon the conduct of all park employees in their relation to the public seeking recreation in any of the parks and playgrounds, and would give advice and instructions to the local division foremen in regard to such matters, just as a horticultural department gives them advice and instructions in regard to lawns, plantations, etc. In those places where the work demands and justifies the assignment of a specialist, the chief of the recreation department, after proper consultation with the division foreman, would have it done by a playground instructor or other employee of his own department, to that extent relieving the local division foreman of the work; just as the horticultural department might send its own planting gang to handle a special job of planting, or its tree gang to do a job of tree-pruning. the work is not thus handled directly by employees of the recreation department, it would of course be done by the force of the local division foreman, through whom the instructions of the recreation department would be transmitted. If any part of the work done by or under a local foreman was not satisfactory to the head of the recreation department, and the circumstances did not justify him in doing it with his own force, he would take up the matter with the superintendent. Similarly if the division foreman felt that instructions received by him from the recreation department or direct work done by the employees of that department within his division were such as to interfere with getting the best results in his division as a whole, he would take the matter up with the superintendent. In this way the principle of the general responsibility of the division foreman for his entire territory would be maintained.

An alternative method would be to segregate certain playground areas from the park divisions in which they occur, to free the regular division foreman from any responsibility for their management or maintenance, and to make the instructor in charge of each of them in

effect a foreman for the area in question, having the same all-inclusive general responsibility for the entire maintenance and operation of the area as the division foreman have over their divisions.

In the case of important isolated playgrounds, this might be a good arrangement; but in the case of playgrounds occurring as incidental features in a large park, or isolated playgrounds of insufficient importance to occupy the entire time of an instructor, it would seem inadvisable. Either method would accomplish the essential purpose of fixing upon some one person the indubitable general responsibility for everything connected with each

piece of ground.

Space does not permit a discussion of all the important functions normally assigned to staff-departments, but I must mention one essential function which ought to be performed systematically and invariably by the same staff-office. It may be performed by the superintendent himself, or by a landscape department, or by a consulting landscape architect without affecting the principle. Every plan for changes affecting the design or appearance of anything for which the commission is responsible, no matter where the plan originates, ought as a matter of invariable routine to be referred to this one office for examination and report before its adoption, and a print or copy kept on file there, in order to make sure that no plan shall be adopted, without deliberation, which is in conflict with plans previously adopted by some other department or preceding administration, and in order to afford a general check upon the esthetic merits and suitability of each plan in relation to the general design of the park, playground or other area which it will affect. It should be the duty of this office to call the attention of any officer of the commission to any plan (originating with others) that would be likely to affect the interests with which that officer is specially concerned, in order to get the benefit of his criticism. To provide thus a central clearing-house for all improvement plans, responsible for pointing out any discrepancies or lack of harmony among them or between any one of them and the general design of any park area, is the best possible means for replacing the too impulsive methods from which our parks have suffered by that stability of purpose which makes for the highest efficiency in such work.

Republished from Landscape Architecture.

#### THE HERBACEOUS PÆONY.

The herbaceous pæony, the "Queen of Spring," so beautiful yet so simple of culture, merits more than a passing thought from garden makers or lovers of flowers, writes H. J. Moore, in *The Canadian Florist*. Its uses are legion, it may be massed or grouped in borders containing other perennials, also along the boundaries of the lawn, or be arranged in beds, and even individually it may be used in any suitable position, while for cutting its flowers, single or double, are equally desirable and equally attractive for general decorative purposes, although for gracefulness the singles are to be preferred.

We are indebted to the old-fashioned P. Officinalis and to P. Albiflora for probably most of our varied and beautiful double kinds, these being obtained by hybridizing the plants mentioned, thence subsequently inter-hybridizing the progeny, the result being the exquisite shades of color which attract and hold the attention of even the most casual observer. Of late years other species have been employed in the production of new varieties, with excellent

results.

Very few plants are so free from the attacks of insect pests as the pæony; for this reason alone, it is, therefore, worthy of more general use in the amateur's garden. The

Japanese singles afford a pleasing contrast to the ordinary double flowered kinds, as does likewise the double crimson flowered P. tenuifolio (P. tenuifolia flore pleno), with its rose-like flowers and its distinctive foliage. For gorgeous effect the pacony is probably unrivaled, especially when it has been allowed to remain undisturbed for many years, and where the clumps are of large size.

Mistakes in the culture of this and other plants are sure to occur. The following precautionary measures may thus obviate much disappointment and discouragement where practiced. Who has not heard the question, What is the matter with my pæonies, they never flower, or if at all, quite indifferently? There are many reasons for this state of affairs, but probably the trouble is due to one of three causes. First, As the pæony naturally forces its crowns (buds or eyes) to the surface where they mature and ripen, nature should thus be respected, deep planting is injurious. Second, The position may be too shaded; partial shade may allow of the production of flowers, sombre shade never. Third, The soil may be light in nature, that is sandy or gravelly, without humus, such a soil being non-retentive of moisture, and, therefore, unable to retain food solutions.

A deep rich soil will suit the paeony eminently. It need not necessarily be light in texture, nor dark in color, if possessing sufficient humus, and fairly retentive of moisture. Good drainage is essential. Never choose a soil or position where this is bad unless it is possible to improve it. Where such a soil does not exist, by incorporating large quantities of humus even a heavy loam may be made productive.

Trenching is the most effective method of preparing the soil. This, however, on a large area is impracticable, resort being made to the plough, which practice is not to be commended on heavy soils unless a subsoiler is used, otherwise a hard layer, known as a plough pan, will be formed into which the production of soil penetrate only with the greatest difficulty, to the detriment of vigorous growth, and the production of flowers. The capillary action of soil moisture will likewise be retarded.

As paeonies establish themselves slowly, and as little root growth is made during the first year, the time of planting is necessarily a great consideration, and while opinion may be divided regarding it, the following argument in favor of fall planting may be taken for what it is worth. Autumn is the proper time for this operation. Under favorable conditions a few roots will be made ere winter arrives, these enabling the plants to start early in the spring, and to make considerably greater progress than were they spring planted. The plants are usually propagated by division, each division containing at least one or more buds or eyes. These should be planted at least three feet apart, four feet being a more desirable distance for the larger growing kinds such as Festiva Maxima, which, as its name implies, means "Large Feast."

When planting, do not cover with more than two inches of soil, deep planting favoring the production of weakly infertile stems, rather than of flowering growth. This is noticeable especially in the case of many specimens planted in lawns. An open sunny position is the best, and being hardy no protection other than a mulch of stable manure is essential to the welfare of the plants. Cultivation is most essential in the case of the pæony. In spring the winter's mulch should be worked into the soil to fertilize it, and during the summer hoeing and raking should be practiced even if only to conserve the moisture. Where large areas are planted the cultivator should be used as much as possible.

New varieties of the pæony are raised from seeds. As four and five years must clapse ere the plants flower satisfactorily, this work had better be left to the hybridizer.

#### NOTES BY THE WAY.

BY WM. H. WAITE.

Lilia Americana, the American Linden, also called the Lime, Basswood and Whitewood. The accompanying illustration is of a specimen on the lawn at Seven Oaks, Mamaroneck, N. Y., where P. W. Popp is superintendent. As will be seen from the photo, the subject makes a stately and handsome specimen when given proper room to develop.

The Lindens are very desirable trees in every way; they are symmetrical, in habit of fairly rapid growth, and not subjected much to the ravages of insects and disease.

The accompanying photo of a group of members of the X. A. G., caught in a happy mood, perhaps needs no explanation, yet a few words of introduction on each may not be amiss.

Leading from left to right, we have J. Scheepers, a native of Holland, yet now a naturalized American, and who is doing much to raise the standard and quality of bulbs. He is an enthusiastic bulbist and is always willing to impart his knowledge to others. Next to him is James Stuart, our able treasurer. He is a well-known grower and exhibitor, and presides over the beautiful place of Mrs. Constable. He has always something of interest to show the visitor, whether it be his Nerines, Cyclamens, Calceolarias or his beautiful perennial garden. He was our host on this occasion, and the picture was

LILIA AMERICANA, ON THE LAWN, SEVEN OAKS.
MAMARONECK, N. Y.

made after we had fully partaken of his and Mrs. Stuart's hospitality, this no doubt accounting largely for the happy smile on the face of our next friend, P. W. Popp. He is well known as the novelty man, for he has always something new to show. But it is in Gladiolus and Dahlias that he specializes, and his annual exhibition of these flowers at Seven Oaks is an eye-opener to many.

We now come to happy Sam Redstone, who for the present has given up the growing end and is now repre-

senting Hitchings Company. Sam is known by all the gardeners in the East and is always welcome. We all know what he can do as a grower, having seen his wonderful roses and carnations at many exhibitions. And last, but by no means least, we have Thomas Aitchison, who presides over Mr. Straus's place at Mamaroneck. He is a redoubtable Lowler, a good grower and a winner of many premiums for his dainty table decorations.

MESSRS. SCHEEPERS, STUART, POPP, REDSTONE AND AITCHISON.

# DESTROY EGG MASSES OF TUSSOCK MOTH AFTER LEAVES FALL.

Washington, D. C.—The caterpillar of the tussock moth, which is noticeable because of three long black tufts of hair protruding from its yellow body, has done considerable damage to many shade trees in the city of Washington during the summer and fall. This insect, which extends through the Eastern United States, as far west as Iowa, seems to prefer poplars, maples, elms, alders, birches and willows. Besides injuring trees, its barbed hairs occasionally produce considerable irritation on the skin of people upon whom the caterpillars drop. To control the ravages of this pest the coming season, the conspicuous white-egg-masses laid by the moth, should be destroyed after the leaves have fallen, when they may be very easily noticed.

The United States Department of Agriculture's entomologist considers the above method preferable to that of banding the trees after the egg masses have already been laid. During the past season a number of trees in the city of Washington have been banded to prevent the moths from climbing up their trunks when there were already egg masses above the bands which hatched out caterpillars. These caterpillars were prevented from coming out of the trees as much as others were prevented from coming into them. Of course, if the owner of a tree is sure that it is absolutely free from egg masses (which are always conspicuous and usually are found low down on the trunk), he may use a band to advantage to keep out intruders. For this purpose insect lime, of which there are several brands on the market, is the best substance, and a ring made around the tree will give service for several weeks in warm weather without being renewed.

As soon as the leaves have fallen, egg masses should be scraped from the trees and then destroyed by burning. The work must be absolutely thorough, and not an egg mass overlooked. A better way, however, is to use applications of creosote oil on the eggs.

### INFLUENCES OF THE GARDEN CLUBS.

By George T. Powell.

A universal interest is growing in horticultural work, and garden clubs are being organized in increasing numbers. The advantages of co-operative effort and action are many, and they are being better understood. Broader knowledge and information may more readily be obtained, while exhibitions are of far larger value and interest through organized clubs or societies than are possible through individual work.

Every club must work out and pursue such policy as is best suited to the local conditions, which vary widely. The Onteora Garden Club, recently organized in the Catskills, has entirely different problems to meet at an elevation of twenty-five hundred feet than the clubs working on Long Island, about Philadelphia, or in New Eng-

land.

Frosts occur in the Catskills in every growing month of the year, while in some instances soil has to be transplanted and placed between rocks to make a place for plants. Winter temperatures are at times more than 30 degrees below zero, which makes the problem of the selection of trees and shrubs quite different than that for the deep soils of sections of milder climates. The adaptability of trees and plants to locality requires knowledge, and this may be obtained through an organized source much more advantageously.

Garden clubs at the present time are being organized along somewhat different lines than heretofore. Committees are appointed for specified work, that the highest degree of efficiency may be had in every department of the work. The Onteora Club, in addition to others, has a committee on home gardens, to carry its activities out to the farms of the locality, and in order to reach the farm homes it has provided for associate members, at an annual fee of one dollar, that farmers and their families may have the advantages of the club, which will be helpful in improving farm home life, and its surroundings, through simple, inexpensive means for beautifying the home in garden work that shall include some flowers and shrubs, along with a wider and better variety of vegetables and small fruits, that will add to the dietary of the farm table.

At a recent flower show of the Lawrence Garden Club, of Lawrence, Long Island, one of the members brought a most excellent and beautiful exhibit of fruit, composed of apples, pears, peaches and plums, from a "patriotic motive," that in these times of so much distress, caused by the high cost of foods, it could be shown what might be produced from the sandy soil of Long Island to contribute to the food necessities of many people.

At the first meeting of the recently organized garden club, of East Hampton, Long Island, one of the special lines of work indicated is to be that of civic improvement. The trees of that very beautiful summer resort were devastated the past season, the foliage being greatly injured by vast numbers of the tent caterpillars that were a scourge in many parts of the country. Information is to be disseminated on the control of such a pest that the trees may be saved and the great beauty of the place kept unmarred. Local pride is to be stimulated that better roads and streets may be maintained.

Another newly organized garden club at Sea Bright, N. J., is equally interested in making the club of value to the community outside of its organization. In all of the clubs are members who take much personal interest in their gardens. They make a study of plant life to know of its requirements in propagation, in feeding, in right pruning; in fact, they want to work intelligently and to bring out the best in plants in growth and development.

That is the real true spirit in garden work, the love of the plant, which always thrives and responds to such care.

The work of these clubs is not to cease when their members close their houses in the country and leave their gardens regretfully behind. They plan to hold meetings in their parlors, and at city club rooms, where courses of lectures on specific subjects will be given, and make a study of the soil, trees and plants—make notes in regular class-room work, obtain the best literature and return to their gardens in the spring, better prepared to obtain the best results.

With such standards as this towards which to work; with the broad and well-considered plans for doing the best quality of work; with the interests of rural communities at heart in an awakened appreciation and regard for the life and protection of trees; for better roads; for better schools, where children may have more of inspiration brought to their lives through better methods of teaching, including more of nature subject, garden clubs in the future, working upon such lines, are going to become a most important factor in their influence upon rural conditions and the country life uplift in which there is so universal an interest.

### LILLIAN SHAW.

The many friends among the gardening fraternity of J. Austin Shaw will be sorry to learn of his sad bereavement in the death of his oldest daughter, Lillian, which occurred at Clarksville, Catskill Mountains, N. Y., on October O.

THULAN SHAW.

Miss Shaw was born at Oshawa, Canada. During the past five years she was engaged in tutoring in Flatbush. Brooklyn and New Jersey, and her popularity among her pupils was attested by the large number which attended her funeral, at the Methodist Episcopal Church, Borough Park, on Monday, October 12.

The floral tributes which filled the home and church showed the universal esteem and love in which Miss Shaw was held by all who knew her.

OCTOBER, 1914.

No. 6.

The beneficial influences of flower shows was once more demonstrated by the exhibition of dahlias and other autumn blooms held at the Second National Bank, Paterson, N. J., under the direction of Wessels Van Blarcom, the assistant cashier, and which attracted large crowds to the bank. The show was held under the auspices of the Paterson Floricultural Society.

The magnificent flowers were in vases and were placed on long tables running the length of the bank. The visitors were shown through the bank by Messrs. Van Blarcom, William D. Blauvelt and Edwin N. Hopson, officers of the institution. The exhibit was a great credit to the flower growers of the city and proved a pleasure to all who witnessed it.

Commenting on the show, the local press wrote editorially:

"It is estimated that 5,000 people visited the exhibition held in the Second National Bank last Saturday. The blooms were of unusual beauty and size and spoke in the highest terms of the patience and care of the exhibitors. The front and back yards of this city have produced some admirable gardens this season and never before have so many ardent and faithful workers been found here. The children have been encouraged to cultivate gardens, with the result that never before in the city's history has floriculture been so city-wide. Seeds that had been freely distributed in the public schools early in the season have since beautified many a back and front vard and all summer hundreds of boys and girls have spent many hours at gardening.

"All this will have its good effect on the community. For no matter what the nationality or the style involved, a fine garden reflects the character of its maker. But if the garden reflects its maker's temperament, it is no less true that often a garden influences it. In one of the American trade publications appears a story told by the general manager of a coal mining corporation at Weyanoke, W. Va., a settlement in the district sorely afflicted with industrial conflicts. He saw that the average man worked short hours and rarely put in full time every month. This idleness was not voluntary, but came about in the regular course of work. Idleness added to the discontent, so he hit on the idea of introducing into the mountain region the small garden system so profitably practiced by the laborers of England. He tried to induce his men to utilize their spare time in cultivating gardens, and offered prizes for various kinds of vegetables and flower plots.

"At first the miners viewed the proposal with suspicion. One or two won the prizes. The next year the change was remarkable. Out of the 225 men employed at the camp all the heads of families but two had started gardens. And splendid specimens they were, if the account can be relied upon. The women brightened their lives by sowing flower seeds—it was color, and color bright-ened their lives. The mine officials summed up the results by saying that it produced a steady and reliable labor supply and the prettiest and healthiest labor camp to be found anywhere.

"What better testimonial could there be to the elevating and profitable influence of vegetable and flower gardens on the lives of the men and women?"

### "THE FLOWERS."

"Take a feller 'at's sick and laid up on the shelf All shaky and ga'nted and pore-Jes' all so knocked out he can't handle hisself With a stiff upper lip any more; Shet up all alone in the gloom of a room As dark as the tomb, and as grim, And then take and send him some roses in bloom, And you can have fun out o' him.

"You've ketched him 'fore now-when his liver was

And his appetite notched like a saw, A-mocking you, maybe, fer romancin' 'round With a big posey-bunch in yer paw; But you ketch him say, when his health is away, And he's flat on his back in distress. And then you kin trot out yer little bokay And not be insulted, I guess!

"You see, it's like this, what his weaknesses is— Them flowers makes him think of the days Of his innocent youth, and that mother of his, And the roses that she ust to raise-So here all alone with the roses you send-Bein' sick and all trimbly and faint— My eyes—my eyes is—my eyes is—old friend— Is a-leakin'-I'm blamed ef they ain't!"

JAMES WHITCOMB RILEY.

# NATIONAL ASSOCIATION OF GARDENERS

W. H. WAITE, President, Yonkers, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

## BULLETIN NUMBER ONE NATIONAL CO-OPERATIVE COMMITTEE.

The National Co-operative Committee, appointed at the meeting of the National Association of Gardeners held in Philadelphia in April, 1914, to devise ways and means to make the proposed co-operative movement between the national association and local gardeners' clubs and societies operative, submits to the local co-operative committees, appointed to work in conjunction with the National Co-operative Committee, the prime objects of this co-operative movement, which are as follows:

To establish gardening as a profession on a firm foun-

dation in America.

To develop a closer fraternity between those engaged in the profession of gardening and those interested in it.

To make known that the vocation of gardening is not acquired through one or two seasons of work in the garden, but through a thorough training—which demands both a practical and scientific knowledge gained only through years of study.

To provide an educational course whereby those ambitious to gain a general knowledge of the different departments of their profession, and not in circumstances to secure it at college, may obtain it through their na-

tional association.

To make the Service Bureau of the National Association of Gardeners an institution to which those requiring the services of gardeners in their various capacities will turn with confidence for their requirements.

To encourage an exchange of views and the disseminating of reports of the doings and activities of the various local societies, whereby the experience of one society may aid in the development of the other societies.

To bring about more uniform conditions to govern flower shows, through the adoption of rules and regulations and an official scale of points for judging flowers, fruits and vegetables by the various horticultural societies, which could be applied to all shows conducted by clubs and societies participating in the co-operative movement.

To arouse the interest of estate owners, and others interested in gardening, in the activities of the local societies and the national association.

The foregoing are a few suggestions of what the plan

contemplates.

The National Committee recommends that the local committees submit these suggestions as a subject for general discussion at a meeting of their society, with a view of bringing out some thoughts which may aid the cause. It especially solicits suggestions and expressions of sentiment respecting the proposed establishment of flower shows on a uniform basis by the adoption of standard rules and regulations and schedule of points to govern them.

It seeks advice on the establishment of an educational department for the benefit of those who may want to avail themselves of study courses, and suggestions on how the Service Bureau may be conducted to provide opportunities for the many rather than for the few. It should be national in scope, yet local in operation, in that the local societies shall have a voice in the filling of positions in their communities.

The National Committee asks that the local co-opera-

tive committees report to it any recommendations their societies may have to offer; also any suggestions the local committee may deem will further the movement. Make such reports not later than the middle of November to M. C. Ebel, secretary, Madison, N. J., so that the National Committee may submit its plans at the annual convention to be held in Philadelphia the first week in December next.

President Waite has appointed the following committee on arrangements for the annual convention with power to increase its number: Thomas Logan, Jenkintown, Pa.; William Kleinheinz, Pa., and John H. Dodds,

Wyncote, Pa.

The annual convention will be held in Philadelphia during the week beginning December 7, and it is proposed to hold a two days' session, devoting the afternoon of the first day to the annual business meeting; the evening to the annual banquet; the forenoon of the second day to the bowling contest, and the afternoon of the second day to seeing Philadelphia. The full program will be published in the next issue of the Chronicle.

There will be an exhibit of novelties and specimen plants in competition for the association's certificate of merit. In this connection it may be well to call attention to the fact that the association offers a medal for any new varieties of flowers, fruits or vegetables created by a gardener, a member of the association, passed on as meritorious by the committee of judges appointed for that purpose. Fuller details of the exhibit will appear in the November issue of the Chronicle.

There has been no "moratorium" declared on the payment of dues in the National Association. Duplicate bills have been sent out for the 1914 dues, but returns have been slow. Members intending to attend the annual convention will require their 1914 membership card to participate in the business of the convention. This card will be forwarded to members by the secretary on the payment of their dues.

Springfield Centre, N. Y., Sept. 29, 1914. Secretary, National Association of Gardeners:

I write to tender my best thanks to the Service Bureau in general, to you Mr. Secretary in particular, for the kind assistance and valuable advice I have received, and in appreciation of which I have pleasure in enclosing \$5 which I offer to the Service Bureau fund to help forward the good work it is doing for the gardening profession.

I do not know if there is such a fund; if there is not, there certainly should be one; and I trust you will accept this contribution either to add to the fund or to start one as the case may be. I hope that other gardeners who may receive benefit from the Bureau will contribute to such a fund, for it would not only aid them in the future, but the profession as a whole.

ERNEST CHAN

The assistance and advise tendered Mr. Carmon by the Sor. a Bureau was a suggestion that he reconsider his assignates to his employer, and retain his position in these triablesome tilles. The suggestion was favorably received and acted on.—SECY.

## AMONG THE GARDENERS

Frank Everden, for the past three years foreman on the Twombly estate, under Robert Tyson, superintendent. has accepted the position of head gardener on the estate of O. G. Jennings, Fairfield, Conn., where he will assume his new duties shortly.

\* \* \*

Henry Gibson, formerly foreman on the George D. Baker estate, at Tuxedo Park, N. Y., where James Mac-Machan is superintendent, has accepted the position of gardener on the estate of Colgate Hoyt, Oyster Bay, N. Y.

Peter Stobie, formerly in charge of the greenhouses on the Osborne estate, Garrison, N. Y., will leave there on October 24 to take charge of the Mrs. William Lee Cushing estate, at Simsbury, Conn.

2/3 2/3 2/3

Present indications are that there will be keen rivalry among some local teams from the neighborhood of New York in the bowling tournament, at the annual convention to be held in Philadelphia in December. It is stated that at least one team may be found on the alleys at every opportunity it can get to practice.

### WM. E. MAYNARD.

In relinquishing his interest in The Gardeners' Chronicle of America, through the passing of ownership into other hands, Wm. E. Maynard has parted with what he for many years prized as a cherished possession. His disposal of it was due solely to enable him to devote his entire attention to the horticultural pursuits in which he has for some time past been engaged. But the interest Mr. Maynard has always taken in the cause for which The Gardeners' Chronicle stands will however, not diminish, for he says, he may be counted on to respond as faithfully in the future as he has responded to it in times gone by.

Mr. Maynard was born in Ellington, Chautauqua County, N. Y., in 1858. In 1865 his parents moved to Ingham County, Mich., where he later received his first insight of horticulture. He taught school for six years and at the age of twenty-one entered the employ of C. L. Vandusen, at that time a nursery man of Geneva, N. Y. Mr. Maynard has followed the nursery business ever since, remaining in the West up to 1894. He then came East and has since been located in New York City

and its vicinity.

In 1904 Mr. Maynard organized the National Association of Gardeners, the first meeting being held at Macy's Hall, Thirty-fourth street and Broadway. New York City. Its first officers were John M. Hunter, president, now engaged in business for himself in Englewood, N. J.; John Whalley, treasurer, who at that time was aborculturist in Prospect Park, Brooklyn, N. Y., and Wm. E. Maynard, secretary. The association was started with forty members. At the next meeting, which was held at the American Institute, New York City, one hundred and thirty-nine gardeners were present. The publication of The Gardeners' Chronicle was begun shortly after the association was organized and has since served as its official organ.

Mr. Maynard held the office of secretary continuously until 1911, when the present incumbent of the office, M. C. Ebel, was elected. On his retirement as secretary, Mr. Maynard was elected a life member in appreciation

WM. E. MAYNARD.

of the services he rendered to the organization. He has always been found a loyal worker and a staunch supporter of the association's policies.

The report which has been circulating that William J. Collins, connected with Carter's Tested Seeds, Inc., has severed his connection with that firm is found to be without foundation. Mr. Collins is still with Carter's Tested Seeds, Inc., and states that he expects to continue with the company for a long time to come.

## A MESSAGE FROM THE WAR ZONE.

Raynes Park, London, S. IV., Eng., Sept. 25, 1914. To the Editor, Gardeners' Chronicle of America, Madison, N. J.

Dear Sir:

We have recently noticed reference in the American Press regarding the war conditions which unhappily prevail in Europe at the present time.

These references suggest that the United States and Canada cannot look with confidence to Great Britain for their usual supply of seeds for the coming year.

We shall be glad if you will intimate in your columns

that there is no foundation for such fears.

This we feel is a matter of public interest and we in this country have every confidence that the British Fleet will be able to safeguard the high road across the Atlantic and to ensure uninterrupted traffic which will maintain with regularity the commercial relations between the two continents, and our American friends can look to British sources of supply with the same confidence as they have in times of peace.

We would also like to take the opportunity of referring to the many communications which we have received from your side of the Atlantic expressing sympathy with Great Britain in her struggle for the right and they give

us the highest satisfaction.

Your obediant servants,
JAMES CARTER & COMPANY,
Raynes Park, London, S. W., Eng.

# AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATION

G. S. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### RESOLUTION OF THANKS.

Relative to the entertainment of the sixteenth annual convention of the American Association of Park Superintendents, held at Newburgh, N. Y., and New York City, August 24-27, 1914:

Whereas, in Alman Street twelve years to the birthplace and lifelong home of Andrew Jackson Downing, the father of landscape gardening and the park idea in America, the American Association of Park Superintendents found a cordiality of welcome and evident warmth of feeling that made its stay a most pleasant one;

The devotion and self-sacrifice of the park commissioners of Newburgh and their superintendent, our fellow member, Chas. A. Haible, who unstitutingly gave of their time and exerted every effort to add to our comfort, the generosity of the citizens of Newburgh in providing automobiles and tendering us the delightful trip through the Tuxedo Valley and the Harriman Estate, the generosity of Mrs. E. H. Harriman in throwing open her beautiful home for our inspection and in tendering the bounteous luncheon at the Tuxedo Club, the reception tendered by the Coldwell Lawn Mower Company and the continued courtesies and attention bestowed by its officers and employees, and the evident good will and welcome of the citizens generally and the liberal publicity extended by the press of Newburgh, all contributed to our enjoyment while in Newburgh;

The trip down the Hudson River, through the magnificent Highlands and the opportunity afforded of viewing some of the workings of the Interstate Park system at close range and particularly for receiving such an enlightening account of the accomplishment and objects of the commission from its president, Hon. Geo. II'. Perkins, who as host for the trip including the luncheon at Bear Mountain Park is entitled to our most hearty thanks, combined to make a day of pleasure and instruction which

will not soon be forgotten;

The day at New York City with the flying automobile trip over Greater New York with the luncheon at Zoological Park will long be a pleasant memory to those who were fortunate enough to be there and we shall ever be indebted to the New York Zoological Society, to Hon. Cabot Ward, president of the New York Park Commission, and other New York officials for the pleasant day at New York:

Therefore, be it resolved that the American Association of Park Superintendents extends its most hearty thanks and appreciation to all those persons who contributed toward the success of our 1914 convention.

F. L. MULFORD,
W. H. MANNING,
R. W. COTTERILL,
Special Committee.

Some little confusion arose during the past month over the change of the official organ, inasmuch as the Chronicle did not reach our members until a few days after a notice from our former official organ to the effect that hereafter the members, by action of the executive committee, would be required to pay their own subscriptions and requesting a remittance or a pledge to remit. This partial statement of fact had our members guessing for a few days until the Chronicle arrived with the announcement that as the new official

organ of the association it would thereafter be sent to every member in good standing.

Some of our members have written the president and secretary expressing the view that the executive committee had made a mistake in changing the official organ. In justice to the committee and for the information of our members a brief explanation is in order.

Our arrangement with the CHRONICLE will result in a saving to the association of several hundred dollars per year over our previous official organ arrangement, in that our subscription fee per member is twenty-five cents per year less, and we save the former expense of the printing of our convention proceedings and bulletins.

The committee also felt that our former official organ was not giving park matters sufficient attention and that its cemetery features predominated. The committee believes the Chronicle to be a much more attractive publication, and one which will serve our interest satisfactorily. The executive committee believes that it acted for the best interests of the association.

Members are urged to contribute articles for our section of this magazine, as we have all the reasonable space at our disposal which we care to use. Many of our members are specially qualified to write on certain subjects which would be of general interest.

If you can and will write a special article on some subject pertinent to park administration, do so and send it either to the secretary or the editor, and it will take its place in this department. And don't forget to send in photos. The editor says he don't care how much he spends for cuts, if he can get good photos, so have your article illustrated.

If you can't or don't care to write a special article, write the secretary a letter occasionally, tell him what you are doing that is new or of interest to fellow members and he will work it into the news notes of this

department.

We are going to get out of this magazine just what we put in it, so everybody help.

The article started in last month's Chronicle on "Park Department Organization" by F. L. Olmsted, is a gem and should be read by every member. If you missed the first instalment, get out last month's issue and read it, and if you can get your commissioners to read it, it will do them good, as it has some good, sound, practical advice to commissioners which every superintendent or secretary will appreciate.

Members out of employment, seeking employment, etc., are urged to communicate the fact to the secretary. Members knowing of openings or prospective openings should also notify the secretary so that he may be of service in putting disengaged members in touch with prospective employment. Communications along this line will be treated as confidential or given publicity as the writer may direct.

If you have any question or problem regarding park administration on which you want the advice of fellow members, send in your question to the secretary; he will get comments from several members on the subject and questions and answers will be published later for the benefit of all.

Your problem is most likely some other member's problem, and yet one that has been solved by other members. A question box will bring out things which are bound to be helpful to many. Now send in your questions and we'll start a question box next month. It's up to you.

If you have not paid your dues for the current fiscal year, do so promptly, so that the association may conduct its business on a cash basis.

Many of our members have deferred paying their dues until the end of the year or at the convention. To illustrate what this means, it may be mentioned that several hundred dollars of last year's bills had to await the convention receipts before being paid.

This system is all wrong and impairs the credit of the association. Our income is not sufficient to accumulate a surplus as our dues are nominal, and as it does not cost any more to pay them in advance or early in the year, members should try and remit early.

The secretary has sent a due bill to every member not paid up, and hopes for a prompt response.

If you did not attend the convention at Newburgh, you did not get one of those neat five color enameled official buttons of the association. The secretary has a supply on hand, and they will be mailed out to all members who remit fifty cents, the cost price. They were sold at this rate at the convention, and all proceeds go to the association funds.

Members of the association who have severed their connection with park work or otherwise, and have requested that their membership be discontinued, are as follows:

C. H. Guengerich, former park commissioner, Joplin, Mo.; Herbert Greensmith, former superintendent of parks, Cincinnati, Ohio; Phelps Wyman, landscape architect, Minneapolis, Minn.; Myron H. West, park builder, Chicago, Ill.; E. W. Robinson, former park commissioner, Denver, Colo.; J. F. MacPherson, former park commissioner, Springfield, Ill.

## PARK DEPARTMENT PERSONALS

Charles A. Whittet, for ten years superintendent of parks at Lowell, Mass., is disengaged and on the look-out for an appointment, as is Richard Iwerson, formerly superintendent at Calgary, Canada.

Frank Brubeck, for many years superintendent of parks at Terre Haute, Indiana, has severed his connection with the park department, owing to a political situation brought about by a partisan mayor who evidently is not broad enough or wise enough to know that park administration and politics should not be coupled together.

Mr. Brubeck was a regular attendant at our conventions, one of last year's vice-presidents, and an honor

to the profession and the association.

He has entered another line of work for the present, but it is to be hoped that he will sooner or later return to park work and in anticipation of this he intends to retain his membership with the association, as does Secretary Wood Posey who, with Superintendent Brubeck, was also a victim of the political changes.

## TREE SURGERY DEMANDS RELIABLE MEN.

A cavity in a decayed tree is something like a cavity in a decayed tooth. If an unreliable tree surgeon only partially removes the diseased part of the wood, uses no antiseptic coatings in the cavity and fills it up with cement the tree is no more cured than is a person whose decayed tooth has not been properly filled by the dentist. The only difference is that after the tree cavity has been covered, if the work has not been properly done, the tree has no way of making its trouble known except by further decay.

Within the last decade there has been a great increase in demand for surgeons to repair decaying shade trees, but the possibilities of practicing fraud in this profession like the instance just cited have tempted so many unreliable people to double in the science that tree surgery has fallen somewhat into disrepute. The U. S. Department of Agriculture realizes that tree surgery should occupy a high place in the estimation of the public, and has recently issued a pamphlet entitled, "Practical Tree Surgery," wherein suggestions are made for improvement along these lines.

As in all professions, there are reliable and unreliable men and firms competing for contracts in tree surgery. In recent years so many occasions have arisen when property owners felt the necessity of calling in commercial tree surgeons to attend to their trees that there are now numerous firms, both honest and dishonest, engaged in the work.

Besides the careless filling of decayed cavities in trees, there are other practices of certain so-called "tree surgeons" that do the trees more harm than good. Many of these "surgeons," as well as the people who employ them, do not realize the danger arising from fresh injuries to a tree. The tree owner should realize that prompt attendance to fresh injuries will largely do away with the need of tree surgery 15 or 20 years hence. The tree surgeons must realize that if they make fresh injuries in the living bark, when treating decayed portions, they are laying the tree open to more dangers of infection that will result in further decay.

Just as a person is subject to infection through cuts and scratches, trees are rendered subject to infection by having their living bark torn. Notwithstanding this, many tree surgeons use pruning hooks and climbing spurs and cut fresh gashes in the tree. To break off small dead branches a workman may use a long pruning hook as though it were a club. In doing so the hook usually causes injury to the young bark near by. Every new wound may furnish a new point of entrance for decay, even though the old dead branch may have been removed.

The use of climbing spurs should be particularly avoided on trees in vicinities where there is a contagious infection. They simply render the treated tree all the more liable to catch the disease which is "in the air."

The U. S. Department of Agriculture is suggesting a plan that may help put tree surgery on a better basis.

- (1) No climbing spurs shall be used on any part of
- (2) The shoes worn by the workmen shall have soft rubber bottoms.
- (3) Ordinary commercial orange shellac shall be applied to cover the cut edges of sapwood and cambium (which is the soft formative tissue from which the new wood and bark originate) within five minutes after the final trimming cut is made.
- (4) All cut or shellacked surfaces shall be painted with commercial creosote, followed by thick coal tar.
- (5) All diseased, rotten, discolored, water-soaked, or insect-eaten wood shall be removed in cavity work before it is filled.

# THE HORTICULTURAL SOCIETY OF NEW YORK.

The Fall Exhibition of this society will be held at the American Museum of Natural History from October 30 to November 3, inclusive. An invitation is extended to all to make exhibits. Prizes are offered for chrysanthemums, both plants and flowers, roses, carnations, foliage and decorative plants, new plants, and orchids, both plants and flowers.

Three prizes of \$50, \$35 and \$15 are offered for twelve vases of cut chrysanthenum blooms, in twelve varieties, three blooms of each, stems eighteen inches long. This should bring out keen competition.

The schedule follows:

George V. Nash, Secretary.

Schedule of Classes and Premiums, Annual Fall Exhibition, New York, October 30 to November 3, 1914.

#### CHRYSANTHEMUMS-PLANTS.

Open to All.

#### Specimen Bushes.

#### THE GARDENERS' POINT OF VIEW.

Editor GARDENERS CHRONICLET

May I be parmatted to and a little to the controversy teading "Gardeners" Grievances"? Such conditions as mentioned by Mr. Liston do obtain in this country, but as I have not worked in a sufficient number of places to ascertain whether such conditions prevail I can at least sately say tout they exist, and exactly as described, for I have lived it a lamp ansamitary old shack, vermin infested, and many many times taken a bath in the stoke-hole or greenhouse. But what of it? Merely a means to an end, and all in the game. Why think of those experiences if they cause bitterness of feeling? Comparisons are sometimes odious, impressions sometimes misleading, and it is well to accept conditions anywhere as we find them unless we are in the position to alter them. In whatever country one may be there are many redeeming features which will more than compensate one for the things that are to us strange or not the same as they are at home. Mr. Siston has been rather unfortunate in his experience, while Mr. Smith in his fairly wide experience has been fortunate; neither gentlemen have been hurt, and personally I have enjoyed myself during over a quarter of a century of "ups and downs." with plenty of the latter; but there is no reason why a temporary state of affairs should make one eternally optimistic or pessimistic, and to the young gardener I would say that our calling is the very best that ever existed. Your position at present may not be exactly what you want, but your mind is smouldering, and will presently break out and then you will be kicked out or leave your position voluntarily; in either event you will probably make progress and in reminiscent moods look back with a smile at your past tribulations. VERNON T. SHERWOOD. New Hampshire.

### Editor Gardeners' Chronicle:

Will you allow me the use of a portion of your space to offer a few words of comment on the contention of "Another Assistant" in August issue of Chronice? I agree with "Another Assistant" he should be qualified to strike for himself after fifteen years, providing in that fifteen years he has been given opportunity to round out his experience under an efficient head gardener that would be competent to judge of an assistant's efficiency. The writer being a graduate of the old school has had some experience of the unfairness shown to efficient gardeners. Very often a competent gardener has to work under conditions unfavorable to his profession. Often head gardeners and superintendents are lacking ability and practical knowledge; consequently are not able to judge a gardener's efficiency, not being qualified themselves. I agree with our worthy secretary that the gardener should be recognized for what he is worth, and efficiency should count, as in all other vocations.

CONSTANT READER.

#### To the Secretary N. A. G.:

The recent controversy on the question of cheap gardeners has brought forth evidence which no doubt infers that many of our assistant gardeners are very much dissatisfied with their lot. We are also asked to believe that the dissatisfaction is due to the indifference at our horticultural societies and gardeners in general. It is to the advantage of most gardeners to excite the interest of their assistants, otherwise results cannot be expected. If any indifference is exhibited by gardeners towards assistants it is through the horticultural societies, the really active members of which are chiefly gardeners. Here meetings are arranged, flower shows held, papers on various phases of horticulture read and discussed, but the assistant seems to think that he is not in it, save as a silent listener. True, much valuable knowledge can be obtained by being such, but in this age of young men that is not enough; they demand something more, and many of our horticultural societies are realizing this fact, and have in many cases inaugurated a class for competition among assistants.

This is a move in the right direction, and shows a spirit that it would be well to foster, for we feel sure that the good to be derived from a closer interest and co-operation between gardeners and their assistants would inevitably result in the upraising of the profession.

of the profession.

I beg, therefore, to be allowed to offer a few suggestions whereby I think our horticultural societies may by a little co-operation with the gardeners arouse the now latent interest and enthusi-

asm of some of the assistants,

I would suggest that of the regular meetings held by our horticultural societies one night (say once a quarter) be set aside to be known as assistants' night. On these nights an exhibition could be made of any kind of plants or cut flowers that had been under the care of the assistant for at least three months previously.

When a show would not be practicable a paper on some phase

of horticulture could be presented by some assistant or an impromptu debate started by several of the assistants, the summing up always to be done by the gardener. At the shows a prize could be awarded to the best exhibit, or a scale of points drawn up and a record of the points awarded kept until the end of the year and a prize given the highest number of points. Of course it must be understood that the winner at each respective exhibition might be required to furnish data as to the methods of culture adopted, etc.

We present these suggestions for what they are worth, but we have no doubt that they could be either modified or elaborated, as circumstances demand, and be of inestimable benefit to all concerned. It perhaps demands much of the gardeners, but we feel sure that they would be amply repaid by the greater interest displayed and consequently the better results obtained by their

assistants.

Moreover, herein lies a valuable course of preliminary education and instruction which will be of no small assistance to those who would like to compete for the N. A. G. diploma of efficiency, which if not just yet is bound to come with the onward march of progress.

INTERESTED ONE.

#### YOUNG GARDENERS.

A striking passage in the address which Sir Harry Veitch delivered to the Horticultural Trades Association recently, was one in which he referred to the difference in the young gardeners of today and those of former years. He regretted the lack of keenness and interest in their work displayed by so many. Sir Harrys words came vividly to my mind when reading the address delivwords came vividity to my mind when reading the address denvered by Principal Whyte to the students at the New College, Edinburgh, at the close of last sesson. The Principal took for his subject "Thomas Boston and the Lessons of His Life." Thomas Boston was a famous old Scottish divine whose works had a great vogue in Scotland last century. One of his most famous works was called "The Fourfold State." Principal Whyte quoted what a famous Scottish minister-Dr. Andrew Thomson, of Edinburgh said of that book. "The Fourfold State' had found its way over all the Scottish Lowlands. From St. Abb's Head to the remotest point in Galloway, it was to be seen side by side with the Bible and Bunyan on the shelf in every peasant's cottage. The shepherd bore it with him, folded in his plaid, up among the silent hills; the ploughman in the valleys refreshed his spirit with it, as with heavenly manna, after his long day of The influence, which began with the humble classes, ascended like a fragrance into the mansions of the Lowland laird and the Border chief, and carried with it a new and a hallowed joy." In those days the sons of such shepherds and ploughmen were the young men who recruited the ranks of gardening. profession of gardening seemed to open up a career for them with greater prospects than that of their fathers, and thousands embraced it. Trained in such an atmosphere and endowed with "the power of work," can we be surprised that they impressed themselves on the mind of Sir Harry Veitch? He must have come across hundreds of them, because, true to the instincts of their race, they are kept "haudin' sooth."—William Cuthbertson in Gardeners' Chroniele, England.

#### Editor Gardeners' Chronicle:

I was so interested in reading the article by Arthur Smith on "The History of the Garden Profession and Its Progress," that I feel that I cannot let it pass without congratulating Mr. Smith on it; especially in regard to his reference to the gardeners' guild as organized in England. Having belonged to a guild. I can speak from experience of the advantage of being a guild member. First, a person must be qualified; second, a guild is generally recognized as a safe method of procuring men of ability; and as there were guilds for people in different walks of life in England, they proved of great benefit to those who were efficient and for those who required efficiency. "CONSTANT READER."

#### THE GARDENER.

A King he is, with an army Of countless blooms, of surpassing beauty: They do not have to fight very hard: Bearers of peace, they capture every hearth, With their message of sympathy and love, Creating bounds, no power can dissolve. A King he is, who seed, plant and grow Flowers that so many blessings can bestow.

-Rodda.

## QUERIES and ANSWERS

We believe the greatest good can be accomplished for the greatest

We believe the greatest good can be accomplished for the greatest number, by instituting a query climin; or an exchange of experiences, on fractical propositions, i.e. ur readers.

You are invited to contribute questions, and answer others.
Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.
We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

matter.
Nothing will tend to better fellowship than helping each other.
Take advantage of this "graver in Ber."

Has any reader of the Chronicle ever grown the Princess of Wales Violet or any other single flowering kind in a cold frame successfully? If so, would they please give their methods?—S L., Penn.

In reply to the query, Can single violets be grown successfully in cold frames? violets can be grown successfully, providing the

following methods are carried out:

In the first place, collect enough leaves and put in bottom of frame to the depth of 6 inches. These will keep a steady warmth to the new soil until the plants have established themselves. soil should consist of a good, turfy loam, well broken up, with a liberal supply of bone meal and wood ashes added. A little spent mushroom manure is beneficial to help lighten the soil. Mix thoroughly, and simply put enough into the frame to plant the stock. It is a mistake to use too great a quantity, as this does not dry out fast enough, causing stagnation. See that you have the plants well up to the sash which gives them as much light as possible. The location of the frames would be best facing south, with a good protection from the cutting north winds, which are very prevalent during the winter months. Good, clean, healthy stock, using great care in planting, is one of the chief things to bear in mind, as you have here the foundation of your success. If your plants are grown at home, you will be able to plant with a good ball of soil, and these will go right away without a check.

Keep the frame closed for a few days, and gradually bring them to outside conditions by admitting air according to the weather.

Protection from Frost: Secure some light stable litter and pack same well around the frames right up to the sashes and keep

adding more as the material settles down.

Have wooden shutters and burlap mats in a handy place for covering the sash, whenever a frost is imminent, but do not cover unless you are really obliged to as it is known that violets will stand  $\frac{1}{2}$  degrees or more frost, without protection. If you find at any time your plants had not been covered over night, and the plants are frozen hard, spray them with cold water and cover to protect the sun's rays from striking them. Do this the first thing in the morning, and after a few hours you can uncover, providing the weather conditions permit, and you will find they will be in a normal condition. One of the chief factors to bear in mind is that the violet is a fresh air loving plant, and dislikes to be cuddled up during ordinary weather. Watering is also to be done with care. When the frames are all planted, give them a thorough watering, and later on you must take advantage of a nice, warm morning to do this to allow them to dry out before night. seen violets covered up entirely for over three weeks in the very severe weather, and upon opening them up they were covered with blooms. Princess of Wales is, I think, the best single for coldframe culture, as it will stand more frost than other varieties. Gov. Herrick is also good, coming in earlier.

E. ROBINSON, Groton, Conn.

In answer to S. L. Penn, page 190, Gardeners' Chronicle, September issue, the writer has been growing violets, single and double, all kinds, since 1879, in coldframes. Has grown Princess of Wales. But THE violet is Luxonne, at least in our locality, 11 miles west of Philadelphia. Have been growing it since its introduction, simultaneously with Princess of Wales. I have seen the latter do better in houses than the first, but it stands no comparison with Luxonne in the coldframe, at least with us.

Any kind, including Luxonne, will vary somewhat from year to year, depending on climatic conditions and upon the care exercised in treatment.

To insure success, note: Be sure to get "young" offshoots with nice white roots to them if possible at end of March or the best young plants obtainable. if you cannot get the first. If potted plants, shake dirt off, examine, throw away old stumpy things, muck well what you keep and heel in carefully outside, protecting against sharp late frosts.

As soon as truck patch or field is ready for planting, plant out carefully, but give another mucking before doing so. They ought to grow then. Plant at least 2 feet apart each way. Do not let them grow out of bounds, but sucker occasionally. Keep clean,

well cultivated. Medium loamy or stony soil is best. By or near the end of September is the time to bring them in, with medium balls to them. Handle carefully. If soil is dry, give the plants a good soaking one week ahead.

As for the frames. If location and soil is naturally well drained, nothing else is needed. If not well drained it must be made so. Any material suitable for such purpose will do. But by no means fresh manure. Five to six inches of soil is required. Should be well rotten loamy soil, sweet and possibly some well rotten manure. Try to have plants at least 8 inches from glass, 1 foot will not hurt. Make frames face south to southeast. Give good dip to glass. Study to have things so that you can keep frost out, no matter how cold the weather may be. Have the best of covers and shutters, so you can keep things dry. If needed put an envelope of dry leaves, straw, manure or fodder round the frame. Anything to keep out the cold. Do not expect violets to bloom if the sun does not shine. But if you have a fair amount of sunshine, and you keep out the trost, and water sparingly and on bright mornings only, it you do not forget airing whenever possible, keeping things clean always, then you ought to have Some seasons the writer could pick flowers from Septemsuccess. ber until April constantly, at other seasons not so well. But it is always worth while, and the show and the joy you ought to have during March is inexpressible.

J. W. MERTZ, Rosemont, Pa.

In reply to the query of S. L., Princess of Wales violets can be successfully grown in cold frames in Pennsylvania; at least 1 have never had any trouble in doing so at Reading.

Of course, a continual supply of flowers depends upon the severity of the winter. Last winter there were only two weeks in which flowers were not cut, but in the previous one, when we had the temperature as low as 22 below zero, there were no blooms for about six weeks during the severest weather. At this period, although the frames were well banked with manure and covered with thick mats and boards, the ground inside the frames froze to a depth of three inches. This, however, did not hurt the plants in the least, as the sub-equent cut of flowers left

nothing to be desired. With the advent of hot sun in the spring the glass should be removed altogether and lath or cheese-cloth shading substituted, so as to extend the flowering period as long as possible into April. As soon as flowers cease the clumps should be lifted and the outside growth of single shoots having a few roots taken and planted in a bed of rich soil a foot apart each way and shaded with Lath screens. Some prefer rooting runners in sand, but as all runners are best kept cut off there should be none of them to root. I have never found any difference in results from divisions or runners. It is not, however, absolutely necessary to plant the above in an outside bed, as they may be just as well put directly into the frame in which they are to flower. In this case it is well to set a few outside to provide for casualties.

In case the frames are required for something else then this may be deferred until August or September, but the former is to be preferred as flowers generally commence to appear by the second or third week of the latter month. S. L. can buy field grown plants now, and he will soon have flowers.

Frequent cultivation and watering when necessary are in order

at all times.

For soil I have been in the habit of using that taken from the benches in which mums and snapdragons have been grown the previous winter, taking out a foot of the old soil from the frames, To each bushel of bench soil I add one peck of screened rotten leaves, 12 peck of shredded cattle manure and I pound of bone meal, working the whole thoroughly with the soil left in the It is well to have this done a week or two before planting. The top of the soil in the frame should be a foot below the glass in front.

Fifteen plants are sufficient for a frame 6 x 3 feet. After planting in the frame cultivation must be continued for which purpose one of the hand weeders is a good tool. Keep runners and all leaves showing the smallest spot of disease removed. Water in the morning thoroughly as often as necessary. as the temperature is liable to go below 40 at night the sash

as the temperature is raine to go below 40 at night the sash should be put on, giving all air possible during the day.

Upon a bright sunny day in November I usually apply 1 pound of bone meal and a 12 peck of sheep manure to each frame, manufacts to the strength of the same. working it into the soil with the weeder, giving after a thorough This watering is generally the last which will be rewatering. quired until the lengthening days of the new year.

Frames should face any way from southeast to south, and be well sheltered from northwest and north winds. Banking should not be put off too long so that as much of the warmth absorbed by the soil du it of the support may be preserved.

possible.

Mats and boards should be in readiness to use as necessary. The latter can be bound to a ome size as t easily be made at home of quarter-inch match boarding. Boards are best put over the mats as they keep rain from the latter and facilitate the removal of snow. Covers should be removed for at least part of every day, excepting the frost should be sufficiently severe to freeze the ground inside the frames in which case the cover may remain until a rise in temperature. But this rarely happens in Pennsylvania. Give all the air possible, taking advantage of sunny days in midwinter to clean up the plants and pick the flowers. ARTHUR SMITH. Reading, Pa.

"The article in the September 'Chronicle' on Aquatic Gardening interested me, but why, may I ask, do we find so little aquatic planting on the country estates? Is it because gardeners in general are not familiar with them? My gardener frankly confesses that he does not understand their method of growing and that it is the work of a specialist. Can you recommend any practical books on the subject from which he can secure some knowledge on growing them?"-Estate Owner, Conn.

"Can any of your readers recommend a successful remedy for ridding a badly infested house of the cattleya fly? I have tried spraying and fumigating and even cutting the fly out of the leaf, but I do not seem to be able to get the better of it. Is hydrosyanic-acid gas safe to use in an orchid house, and would this be effective?"-L. M., Missouri.

"I would like to get some information on the cultivating of the blueberry, which I understand is finely grown on some of the estates in Massachusetts. They grow to perfection in our section in the wild state, but we do not seem to succeed in cultivating them successfully. Any information you can give me regarding their culture will be appreciated."—U. M., Nova Scotia.

# **Prize Cups and Trophies** for Flower-Shows, Horse-Shows, Fairs and Other Events

HE collections of prize cups and other pieces of sterling silver and silver plate for trophies, shown by the INTERNATIONAL Store, are the most extensive and varied to be found in New York City, as they represent the products of the many great factories of the International Silver Company.

Trophy committees will find wonderful satisfaction in selecting from such an assemblage, which meets every requirement as to style and form, and ranges from the simplest pieces up to the most elaborate designs, especially created for important events.

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

The annual Dablia Show of the Nassan County Horticultural Society was held at Pembroke Hall, Glen Cove, L. L. on Tuesday. October 6. As far as a dahlia show went it was a failure, as in this section dahlias were so scarce that out of 14 classes there were only 4 classes entered for. Vegetables were especially good, Henry Gaut, gardener to Mr. H. L. Pratt, taking two firsts for collections. In one which was unlimited he staged 86 varieties. There was a good display of outdoor flowers for a collection of 25 varieties and very close competition. In roses the entries were not quite so numerous, John W. Everitt, gardener to John T. Pratt, taking the silver cup for collection of outdoor roses, 12 varieties, 6 of each. In table decoration, it being limited to dahlias. the entries were bad, only two competitors. which did not bring out anything so good as I have seen when competition has been keener.

Class 9.—Best 6 cactus dahlias, 6 varieties, short stems: 1st, H. Godwin (A. Golon, gardener).

Class 10. Best 6 decorative dahlias, 6 varieties, short stems:

Class 11.—Best vase 6 cactus dahlias, 1 variety, long stems: 1st. H. Godwin; 2nd, S. D. Brewster (John Fogerty, gardener).

Class 12.—Best vase 6 decorative dahlias 1 variety, long stems: 1st, H. L. Pratt (Henry Gaut, gardener); 2nd, S. D. Brewstor

Class 13.—Best vase 6 show dahlias, 1 variety, long stems:

Class 14.—Best vase, 12 dahlias, any type: 1st, S. D. Brewster; 2nd, C. D. Smithers (Pierre Charbonniad, gardener).

Class 15. Mrs. E. M. Townsend, special, silver cup, to be won three times. Best collection of outdoor roses, 12 varieties, 6 flowers of each (members only): 1st, T. T. Pratt (John W. Everitt, gardener): 2nd, Harvey S. Ladew (Jos. Adler, gardener).

Class 16.—W. R. Kinnear special, Best 3 vases outdoor roses, 3 varieties, 12 of each: 1st, Harvey S. Ladew.

Class 17.—Best vase 12 roses, mixed varieties: 1st, Percy Chubb (F. Honeyman, gardener): 2nd, T. H. Ottley (Jas. Macdonald, gardener).

Class 18. Mrs. C. F. Cartledge, special. Best collection of outdoor flowers, not more than 25 varieties, I variety in vase: 1st, F. H. Ottley; 2nd, Howard C. Smith; 3rd, W. V. Hester.

Class 19.-Best vase of hardy asters, 12 stems:

Class 20.—Best vase gladiolus, 12 spikes: 1st. W. V. Hester (Herman Boettcher, gardener): 2nd, H. C. Smith.

Class 21.—Best vase cosmos, white: 1st. Percy Chubb.

Class 22.—Best vase cosmos, pink: 1st. Percy Clubb.

Class 23.—Best vase cosmos, red: 1st. Percy Chubb.

Class 24.—Best vase antirrhinum, 12 spikes: 1st, W. V. Hester; 2nd, Percy Chubb.

Class 25.-Mr. A. G. Hodenpyle, special. Best collection vegetables: 1st. H. L. Pratt: 2nd, H. C. Smith (A. Walker).

Class 26.—Shimpp & Walter Co., special, silver cup. Best collection of 12 kinds vegetables: 1st, A. G. Hodenpyle (Frank Petroccia); 2nd, Percy Chubb.

Class 27.—Weeber & Don, special, cut glass vase, value \$10. Best collection 9 kinds of vegetables: 1st, H. L. Pratt; 2nd, A. G. Hodenpyle.

Class 28.—Mr. John Wilk, special. Best

6 kinds vegetables: 1st, T. H. Ottley; 2nd, V. Hester.

Class 29.—Carter's Tested Seeds Co., special. Best collection of salads, tasteful arrangement to count; 1st, A. G. Hodenpyle. Class 43.—Best 12 onions: 1st, H.

Pratt; 2nd, A. G. Hodenpyle.

Class 44.—Best collection herbs, 12 varieties; 1st, Thos. L. Leeming; 2nd, H. L. Pratt.

Class 45.-Best collection outdoor fruit, not more than 12 varieties, arrangement to count: 1st, H. L. Pratt; 2nd, W. V. Hester.

Class 46.—Hohler Bros., special, Six vanicties outdoor grapes. 2 of each: 1st, H. L. Pratt; 2nd, W. V. Hester.

Class 47.—Best bunch greenhouse grapes, white: 1st, H. Godwin.

Class 51.-Best 3 varieties pears, 6 of each: 1st, H. L. Pratt: 2nd, J. H. Ottley.

Class 58.—Best plate any outdoor fruit: 1st, H. L. Pratt.

Class 63.—Frank Connine, special. Best table decoration of dahlias to seat 6 persons: 1st, Mrs. J. H. Ottley (James Macdonald, gardener); 2nd, H. Godwin (A. Go-Ion, gardener).

Special prize to Mrs. G. M. Townsend (James Duthie, gardener) for large collection of dahlias. Cultural certificate to W. V. Hester for 4 varieties apples, 6 of each, and to M. Annskiecwiez for 6 peaches; honorable mention, A. G. Hodenpyle for Giant Fennel, and G. Hawkshaw for pumpkin. John Lewis Childs staged a collection of dahlias, and received honorable mention for seedling No. 2 and certificate of merit for ('elocia, wool flower (new), being a solid hard-like ball, with sprays of the plumosa type all round it. HARRY JONES, type all round it. HARRY MARRY Corresponding Secretary.

### THE HORTICULTURAL SOCIETY OF NEW YORK.

A very successful dahlia exhibition was held, in co-operation with the New York Botanical Garden, in the Museum building of that institution, on Saturday and Sunday, September 26 and 27. It was the first dahlia show given by the society. There was a fine display of this popular flower in all its diverse forms and colors. The most striking

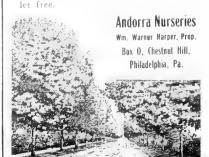

## of growing Shade Trees and Shrubs

produces specimens that will complete produces specimens that will compete a landscape planting in a few short months rather than in years. Cultivation and re-cultivation gives hardiness and vigor to the trees grown the and viger to Anderra Way.

### VISIT ANDORRA IN AUTUMN

when the foliage is taking on gorgeous tints, and the effect you desire around your own place is shown in Nature's colors. Come by motor, train or trolley. If you require immediate planting suggestions, write us—we are here to serve in the Andorra Way. Our booklet free

feature of the exhibition was the display of | blooms arranged by Mrs. Chapman, of Westerly, R. I. Two tables fourteen feet long were artistically decorated by her. One of these tables was especially pleasing, all the tints associated with the foliage and flowers of autumn were so blended and arranged as to produce a most harmonous effect. was the admiration of all. The dahlia is so much more striking thus arranged than in the formal manner customary in exhibitions, that it is surprising it is not more frequently thus displayed.

A meeting of the society was held on Saturday at 2.30, the president, Mr. T. A. Havemeyer, presiding. Dr. Britton, director-in-chief of the New York Botanical Garden. gave a short talk on the origin of the name Dahlia, including a brief account of the distribution of the genus. Dr. H. H. Rusby followed with a short address on the home and environment of the dahlia, illustrated with lantern slides. At the conclusion of this a discussion on the present-day methods of culture was led by Mr. P. W. Popp. in which many took part.

Following is a list of the awards:

Largest and best collection, flowers on short stems: Geo. L. Stillman, first; N. Harold Cottam & Son, second.

Vase of 12 cactus: Head's Bergenfield Nurseries, first; P. W. Popp, second; N. A. Miller, third.

Vase of 12 decorative: W. A. Manda, first; N. A. Miller, second; N. Harold Cottam & Son, third.

Vase of 12 showy or fancy: N. Harold Cottam & Son, first.

Vase of 12 pompons: Wm. Shillaber, first; N. Harold Cottam & Son, second.

Vase of 12 single or collarette: Stillman, first; Head's Bergenfield Nurseries, second; N. A. Miller, third.

Vase arranged for effect: first; Dr. M. A. Howe, second.

All of the above in open-to-all classes. The following prizes were awarded in the

non-commercial classes: Collection of not over 50 blooms: P. W.

Popp, first; Wm. P. Clyde, second. Vase of 8 blooms, cactus: P. W. Popp, first; Geo. D. Barron, second; Wm. Clyde, third.

Vase of 8 blooms, peony-flowered: P. W. Popp, first: Wm. P. Clyde, third. The second was not awarded.

Vase of 8 blooms, decorative: P. W. Popp. first; Geo. D. Barron, second.

Vase of 8 blooms, pompons: Wm. Shillaber, first; Geo. D. Barron, third. The second was not awarded.

Vase of 8 blooms, single or collarette: P. W. Popp, first; Geo. D. Barron, third. The second was not awarded.

The following special prizes were awarded: Wm. Shillaber, for a collection of annuals. bronze medal; Mrs. F. A. Constable, vase of Conoclinium coelestinum; W. Atlee Burpee, certificate each for the new dahlias "Mrs. Hugh Dickson" and "Mrs. W. E. Whineray." and special mention for "Mrs. Geo. W. Kerr"; Lager & Hurrell, for a collection of cut orchids: O. P. Chapman, Jr., for artistic display, silver medal and a cash prize; Geo. L. Stillman, certificate each for the new dah-

Manda, Inc., certificate each for new dahlias "Josef Manda" and "Bohemia Garnet," and man, special mention for "Veronica Manda,"

GEORGE V. NASH, Secretary.

#### NEWPORT HORTICULTURAL SOCIETY.

Three important committees were pointed at the monthly meeting of the New port Horticultural Society, September 21. The society appointed Bruce Butterton, V. S. Meikle and William Gray a committee to co-operate with the American Sweet Pea Society in arranging for the show to be held here next summer. The Newport Garden Society made a liberal donation toward the expenses of a course of lectures that are to be a feature of the winter, and James Robertson, James Bond and William Gray were made a lecture committee. committee, consisting of A. S. Meikle, Winfred Sisson, Bruce Butterton, C. M. Bugholt, James Robertson, John B. Urguhart and Alexander McLellan, was appointed to assist in securing decorations for the coming Y. M. C. A. bazaar.

#### CONNECTICUT HORTICULTURAL SOCIETY.

The annual dahlia and vegetable exhibition held at Unity Hall, Hartford, on September 23 and 24 was an exceptionally good one. One of the largest displays was shown by George L. Stillman, of Westerly. There were excellent exhibits of perennials by J. F. Huss, Warren S. Mason and W. W Hunt & Co., each exhibit comprising in the neighborhood of 100 varieties.

The vegetable exhibits were good and unusually well staged. The judges were G. X. Amrhyn and John N. Champion, both

classes were as follows:

Show 18 blooms, 18 named varieties -N. Nelson, Hartford. Show 12 blooms, 12 varieties -1st, C. Louis Alling, West Haven, Conn.; 2nd, Alfred E. Doty, New Haven. Cactus, 18 blooms, 18 varieties—1st. C. Louis Alling; 2nd, Alfred E. Doty. Cactus, 12 blooms, 12 varieties—1st, C. Louis Alling; 2nd, N. Nelson. Fancy, 12 blooms, 12 varieties 1st. N. Nelson. Fancy, 6 blooms, 6 varieties—1st. N. Nelson; 2nd, A. E. Doty. Decorative, 12 blooms, 12 varieties—1st, N. Slocombe, Farmington, Conn.; 2nd, N. Nelson. Decorative, 6 blooms, 6 varieties—1st, C. Louis Alling; 2nd, A. E. Doty. Single, 6 vases of 3 blooms each 1st, N. Slocombe; 2nd, W. S. Mason. Peony, 12 vases -1st, N. Nelson; 2nd, J. F. Huss. Peony, 6 vases -1st, C. Louis Alling; 2nd, N. Nelson. Peony. best collection John F. Huss. Pompon, 12 vases 1st, N. Nelson. Pompon, 6 vases Pompou, 6 vase 1st, C. Louis Alling; 2nd, N. Nelson. 50 varieties, 3 blooms each-1st, George L. Stillman; 2nd, Warren S. Mason, Farmington, Conn. Collection of Decorative—N. Nelson. Cactus—1st, N. Nelson; 2nd, A. E. Doty. Pompon -C. Louis Alling. Faney-N. Nel-Peony G. L. Stillman. Collarette 1st, G. L. Stillman; 2nd, J. F. Huss. Vase of 25 blooms -1st, N. Slocombe; 2nd, W. S. Mason. Collection of seedlings 1st. J. F. Huss; 2nd, N. Nelson. Floral piece of dah-

bloom 1st, Alfred E. Doty: 2nd, G. L. Still-

Open to all. Gladioli, 12 spikes -A, Righenzi. Six vases of gladioli, 6 blooms each A. Righenzi. Six vases of asters-1st, W. S. Mason; 2nd, A. Righenzi. Asters, 25 blooms, one variety -1st, H. L. Metcalfe, Hartford, Conn.; 2nd, A. Righenzi. Collection of asters, 25 blooms of each—1st, A. Righenzi; 2nd, H. L. Metcalfe. Snapdragon

J. M. Adams, Hartford. Display of Annuals 1st, J. F. Huss; 2nd, N. Nelson. Fruit 1st, Louis Chauvy, Hartford; 2nd, J. F. Huss. Vegetables-1st, J. F. Huss; 2nd, Louis Chauvy. Exhibit of most general merit George L. Stillman. Dahlias in pots A. Righenzi. Dahlias, 12 blooms, one variety 1st, C. Louis Alling; 2nd, N. Nelson.

Specials. By Stumpp & Walter Co., New York. Ten varieties of vegetables -1st, J. F. Huss; 2nd, Alfred Cebellus; 3rd, Louis Chauvy.

By Arthur T. Boddington, New York. Ten varieties of vegetables 1st, A. Righenzi; 2nd, J. F. Huss

By C. H. Sierman, Hartford, Display of erennials-1st, J. F. Huss; 2nd, W. W. 'Hunt & Co.

Special displomas were awarded to John Huss for arrangement of palms and stove plants; G. Minge for group of Boston ferns: to John H. Slocombe, for display of seedling dahlias; to the Park Department for display of geraniums, dahlias and hardy perennials; to W. W. Hunt & Company, for exhibit of bay and bexwood trees.

ALFRED DIXON, Secretary.

#### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

An enjoyable evening was spent by the of New Haven. Awards in the professional members of The Westchester and Fairfield Horticultural Society who attended the regular monthly meeting held in the society's rooms, Doran's Hall, Greenwich, Conn., Friday evening, October 9, President Williamson presiding. There was a large attendance even for the well-attended meetings enjoyed by our society. The membership is constantly increasing. One active and one honorary member were elected, and several proposals for membership were recerved. The Fall Show Committee reported several liberal contributions to the Premium list; also that the schedules were ready for distribution and everything in readiness for a successful exhibition, which will be held in Germania Hall, New Rochelle, N. Y., November 4, 5 and 6. Information, schedules, entry blanks, etc., may be procured from the secretary of Show Committee, Mr. Oscar Addn, Larchmont, N. Y. Keen competition is anticipated.

In the death of Mr. Henry Darlington, who passed away recently, the society sufters the loss of a life member and good friend whose interest in our welfare has at all times been appreciated by the entire membership. A committee was appointed to draft resolutions of sympathy to be spread upon the minutes and a copy to be presented to the bereaved family. lias "Geo. L. Stillman" and "Searchlight," and special mention for "Fire Girl"; P. W. Popp, for display of collarettes; W. A. G. L. Stillman; 2nd, N. Nelson, Floral piece of dath, ture of the meeting was the lecture entitled lias N. Nelson, Specimen seedling 1st, "Landscape Architecture," by Mr. Nathan G. L. Stillman; 2nd, N. Nelson, Fangest F. Barrett, of New Rochelle, N. Y., to whom

Don't Neglect Fall Spraying

9 9 Modern Method's Demand It

It pays to get in fall spraying whenever possible. There is danger in waiting for spring spraying. "Scalecide" is better than any other dormant spray, either for insects or fungi. Costs no more than lime-sulphur or the less core tive mixtures. O a cooklet "Scalecide, The True S." ed free. B. G. P: 100 a. Dupt. "4", 50 Church St."

# IOSEPH MANDA

Orchid Specialist

West Orange - New Jersey

we are indebted for an enjoyable and pleasing lecture. Mr. Barret gave an interesting description of landscape gardening of the different periods of the olden times down to the present day methods of combining the artistic with the practical side of the gardener's art. The speaker pointed out very plainly the relative positions of the artist and the gardener, and recited some interesting personal experiences that have occurred in a practice of over 50 years. A rising vote of thanks was tendered to the speaker for the pleasure afforded the members. Despite the long drought of the past three mouths there was a remarkably fine display on the exhibition tables. special prize offered by Robert Allen, of Greenwich, Conn., for the best display of six varieties of vegetables grown out of doors was won by John B. Andrew. In the non-competitive exhibition the judges made the following awards: Cultural Certificate to E. Lewis for display of onions "Gigantic Gibraltar"; Cultural Certificate to Robert Williamson for a fine collection of vegetables, also Honorary Mention for a display of peaches, muskmelons and English walnuts; a Cultural Certificate also a vote of thanks to P. W. Popp for an interesting display of Dahlias, six types and 110 varieties were represented. The thanks of the society were tendered to the other exhibitors for their very meritorious display: Carl Hankenson for Hadley Roses, John Beck and Sons for Chrysauthemums "Golden Glow," J. B. Andrew for display of apples; John Couroy for seedling "Mum," a cross between Mrs. H. Robinson and Cheltonii, Robert Grunnert for display of Carnations in variety, James Stuart for vase of hardy, early fl. "Mums." "Normandie" and a fine vase of Conochlinum collestinum, a fine blue colored perennial. useful for cutting and garden decoration. also known as Eupatorium collectinum. Next meeting November 13.

P. W. POPP.

#### NEW BEDFORD HORTICULTURAL SOCIETY.

The annual dahlia exhibition of the New Bedford Horticultural Society held in the Library Building on Tuesday, September 22 and 23, was very pleasing. Owing to weather conditions dahlias in this section have not done as well as usual, nevertheless the tables were well decorated with excellent specimens. The principal competition centered around the class for dahlias arranged for effect with any foliage, covering 30 square feet. Dahlia exhibitions as a rule do not present as attractive an appearance as peonies, roses or chrysanthemums, so, to induce exhibitors to overcome the stiff, set look of such shows, the principal prize was given in this class. The result was very gratifying, the sameness of previous exhibitions disappeared and the hall looked very Arthur E. Griffin superintendent of the Galen Stone place, captured first prize with a stand of crotons, caladiums and ferns intermingled with large vases of dahlias in the rear and specimen blooms in the foreground. W. D. Hathaway, second with a display of the finest blossoms in the show, but lacking in effect enough to lose the coveted first prize. Wm. Keith, gardener for T. M. Stetson, third with a nice

number of flowers, the effect being good, but from the standpoint of a dahlia show, the main display was lost among the green. J. C. Forbes had a fine table comprising vases of single and peony-flowered dahlias. Among the amateurs J. A. Nolet of this city was high man, capturing nearly all the first priezs

Noteworthy seedlings were exhibited as follows:

Mrs. Frederick Grinnell-a deep rich pink peony-flowered variety of excellent form and fair stem. Exhibited by J. P. Rooney. Henry Denison-eactus, clear pink shading lighter toward the centre, of massive build with numerous heavy petals. Exhibited by Forbes & Keith. Mrs. Lillie P. Hathaway, buff decorative of good size with strong erect stem and Miss Edna L. Hathaway a good addition to the list of orange decoratives. Exhibited by W. D. Hathaway.
W. F. TURNER.

#### NEW JERSEY FLORICULTURAL SOCIETY.

The annual exhibition of Dahlias, Gladioli, fruits and vegetables of the New Jersey Floricultural Society was held on Monday. October 5, in the J. O. U. M. Hall, Orange. N. J.

The judges were Wm Duckham, Arthur Herrington, John E. Lager and Ed. Eccles.

Thirty-six Dahlias, 12 varieties: 1st, Mrs. W. Barr, Llewellyn Park; 2nd, W. A. Manda, Inc., W. Orange; 3rd, P. W. Popp. Mamaroneck, N. Y.

Twenty-five show Dahlias in variety: 1st, Peter Hanck, Jr. (gardener, Max Schneider), East Orange, N. J., who won the silver medal donated by the Henry F. Michell Co., Philadelphia.

Twenty-five show Dahlias: 1st, P. W. Popp, silver medal.

Twenty-five cactus: 1st, Mrs. W. Barr; 2nd, P. W. Popp.

Best centerpiece of Dahlia: 1st. Peter Hauck: 2nd, Frank Drews, Essex County Country Club.

Twenty-five Peony flowered: 1st, W. A. Manda, İnc.; 2nd, Mrs. W. Barr.

For the best collection of Orchids, Joseph 1. Manda, West Orange, was awarded first premium. The silver cup for a basket of Gladioli was captured by Max Schneider.
S. and A. M. Colgate, West Orange, won

the first prize of \$20 for a group of foliage plants for effect, with Crotons, Dracænas. nalms, etc.

There were three model gardens, planned in a space 5 feet square. First was awarded to Alf Thomas, gardener to Mrs. Arthur J. Moulton, West Orange, Second, Frank Drews, Essex County Country Club, West Orange. Third, William Zeidler, gardener at Hutton Park.

There were some good displays of vegetables, the best exhibit being by C. C. Goodrich (gardener, Fritz Bergeland).

A cultural certificate was awarded to A. J. Moulton for double Petunias in pots; and for Coleus Pride of Castle Gould and for Nephrolepis: also for C. C. Goodrich, for Cissus discolor.

### MONMOUTH COUNTY HORTICULTURAL SOCIETY.

A regular meeting of the Monmouth County Horticultural Society was held in the Monmouth Motor Boat Club meeting rooms, with President William Metzdorf in the chair. A good attendance was present and a very interesting meeting was the outcome. Several subjects of importance were debated. Prominent among them was

grants use street discharge in the chestnut blight disease. A spirited discussion followed and various opinions were given. The bowling club is getting active again, and it is the earnest desire of this club to bowl a match game once a week all winter from teams picked from the club. Some high scores are anticipated as some of the members are expert in this famous pastime.

The Monmouth County Fair was held recently and a number of valuable cups and money prizes were brought home by some of the members. The fair has a special class for the private competition, which is very keen and interesting. The premium lists of this society are now ready for the James' Hall, Red Bank, N. J., on Wednesday and Thursday, October 28 and 29, 1914. The exhibition committee anticipates a good show and they would like a large entry, especially from outside of our immediate vicinity. Entries must be made and premium lists can be had by writing to Secretary H. A. Kettel, Fair Haven, N. at least four (4) days in advance of the show. All exhibits from a distance should be addressed to Secretary H. A. Kettel, Red Bank, N. J., care St. James' Hall, and they will receive prompt and careful attention. PHILIP BONNER, Cor. Sec.

#### NEW BEDFORD HORTICULTURAL SOCIETY.

The eleventh annual dahlia show of the New Bedford Horticultural Society held in Library Hall on September 23 and 24, while not as large as usual, certainly proved a very pleasing affair. New Bedford had one of the most erratic seasons within the memory of man, and dahlias simply sulked with the result that amateur displays were conspicuous by their absence, leaving the burden on a few large growers. The principal prize (a cup offered by the Executive Committee) was sharply contested for, and the exhibits in this class formed the principal beauty of the show. This cup, offered for the best display of dahlias arranged for effect with any foliage was captured by Arthur E. Griffin, superintendent of the Galen Stone place at East Marion, with a very tasty display. W. D. Hathaway came

very tasty display. Which third,
Among the amateurs P. A. Nolet won most of the prizes. WM. F. TURNER.

#### SHORT HILLS GARDEN CLUB.

The Dahlia Show of the Short Hills Garden Club, held at Short Hills, N. J., on October 2 and 3, was pronounced a decided success. Many visitors from Princeton, Trenton, Philadelphia, Tuxedo Park, Bernardsville, Long Island, Staten Island and other places viewed the exhibit which consisted mainly of dahlias grown in the gardens of the members of the Short Hils Club.

The blooms were displayed with large stems and foliage, three to the vase, and the points of judging were the same as those ased in judging roses according to the American Rose Society's schedule. The prizes were awarded as follows:

Singles—First, Mrs. C. H. Stout; honorable mention, Mrs. G. W. Campbell and Mrs. J. A. Stewart, Jr.

Seedlings--Mrs. E. B. Renwick.

Decorative—First, Mrs. W. K. Wallbridge; honorable mention, Mrs. J. A. Stewart, Jr., and Mrs. C. H. Stout.

Cactus - First, Mrs. E. B. Renwick; honorable mention, Mrs. Dean Emery and Mrs. J. A. Stewart, Jr.

Peony First, Mrs. J. A. Stewart, Jr.; honorable mention, Mrs. E. B. Renwick.

Table Decorations-First, Mrs. F. Rhodes.

# Thorburn's BULBS

To the gardener:

YOU, who depend for your profit upon the reliability of seeds and bulbs, feel rightly that a bargain is not of the first importance.

Yet we often have an overstock which we are able to supply below the market, and would be very glad to send you particulars on request.

If you have not received a copy of our 1914 Bulb Catalog, send for it. We printed one especially for you. It contains a wealth of information which will be of use to you.

A large proportion of our business is with those who "raise for profit." Think this over, and let us hear from you.

# Two Graperies Side By Side

E built the glass enclosed one. Built it with all the superiority of construction and nicety of finish that a firm with half

a century's experience, like ours, can. We said "like ours"; which statement might lead you to infer that there actually were other greenhouse building concerns half a century old. But there is not another such concern.

Half a century of building rolls up a lot of experience. It's just about enough, however, to put us in a position to meet building problems and conditions as no other concern can. Which statement is not boastful, but a plain statement of a plain fact that no one can contradict.

If you are thinking of building and ready to talk it over, say when and where and we'll be there.

# The Highway to Perennials Leads Straight to the PALISADES NURSERIES

There you will find all kinds, and you can take your pick from the best that grow. Perennials add a feeling of permanency to the home surroundings. They change their plumage, but not their face, and keep reflecting the seasons all the year around.

FALL PLANTING-To grow most hardy perennials and old-fashioned flowers successfully, plant in November, like planting Spring-flowering bulbs. They then root during Fall and Winter, and are ready for Spring and Summer blooming.

No grounds are really gardened without a big showing in perennials. We are head-quarters for perennials and assure the widest latitude in choice as well as the most cour-teous promptitude in correspondence and service. Our motto "Maximum Quality at Minimum Cost."

# FRENCH Hydrangeas

We offer in splendid shape for early forcing the follow-ing varieties of French Hydrangeas, elegant stock, in 6 inch pots.

AVALANCHE-Large corymbs of pure white flowers;

AVALANCHE—Large corymns of pire white nowers; very free flowering.

BOUQUET ROSE Large trusses of well formed flowers; rosy amber, turning to bright pink.

E. G. HILL Trusses of immense size of a most pleasing shade of pink

GENERAL DE VIBRAYE—Very large heads of bright rose, a splendid forcing variety

LA LORRAINE—Very large flowers; pale rose, turning to bright pink.

LA LORRAINE—Very large flowers; pale rose, turning to bright pink.

MME. MAURICE HAMAR—Large, delicate flesh-rose color; a pleasing shade.

MLLE. AGNES BARILLET—A splendid large white.

MME. EMILE MOUILLERE—One of the very best; very large flowers, frequently over 2 inches in diameter, of the purest white, with rosy-carmine eye.

MONT ROSE—Immense panieles of a clear flesh-rose.

RONSARD—Very large individual flowers and trusses of a beautiful rose.

SOUVENIR DE MME. CHAUTARD—One of the pretiest; robust habit, medium-sized corymbs of bright rose-colored flowers.

VIEUW CHATEAU—Immense trusses of white flowers which as they mature become suffused with a delicate rosy tint.

Good 6 inch pots, 50 cts, each; \$5.00 per doz.

Good 6 inch pots, 50 cts. each; \$5.00 per doz., \$35.00 per 100.

# Belgium's Contributions to Pomology

At the present time, when the sufferings of Belgium are attracting the sympathy of the civilized world, it is impossible for horticulturists to forget the debt they owe to that country. The gardens of the whole world have profited much from the natural aptitude of the Belgians for horticulture, and their sustained interest in pomology. The names of towns and villages, now, alas! of unhappy fame, cannot be read by gardeners without calling up memories of this or that fruit with which they are associated. It is, therefore, of interest to recount some of the main facts of Belgian pomological history, in order that we may realize how much is due to this small country for the fruits that have so greatly enriched the gardens of the world.

It may be presumed that the fertile soil of the country has for many hundreds of years been favorable to the culture of fruits, as it is mentioned by Roman authors as a land famous for its apples. Before the eighteenth century France was the unchallenged leader in the production of new fruits, but the varieties which were introduced were doubtless all chance seedlings, as the methods of cross-fertilization were then unknown. In the early part of that century the sexuality of plants was beginning to be widely known and taught at the universities, and it is almost certain that this knowledge was first utilized as a practical means of producing new fruits in Belgium by Nicholas Hardenpont. This remarkable man was born at Mons in 1755, and received his education at the University of Louvain. After taking his degree he returned to his native town and commenced the experiments which caused him to be regarded as the Father of Pomology in Belgium. At this time the pears which were generally grown were mostly of the crisp-fleshed variety, and it is thought, with some reason, that Hardenpont sought to increase the number of those with fondant or melting flesh. Be this as it may, his results are certainly such as to confirm this opinion. His most famous seedlings are Beurré d'Hardenpont and Beurré Rance. The former is now known in England as Glou Morceau, a name which it received about 1800, and which signifies "dainty morsel." It is to be regretted that this valuable pear, now so widely known, should not retain its original name and thus keep alive the memory of its raiser. Beurré Rance is still widely grown in this country, and the name has been the subject of several stories. One of these describes a visit of some enthusiasts to the Abbé Hardenpont, who asked them to try the new pear. One of those present said it had a rancid flavor. "Rancid!" said the indignant raiser, "I will call it Beurré Rance to perpetuate and shame your bad judgment." This story, probably ben trovato, is put aside by more serious writers in favor of a derivation from the Flemish "rens," or "reinsch," signifying bitter, a flavor which under bad conditions this fruit occasionally develops. Passe Colmar,

an excellent December fruit when grown on a warm soil, is another of the famous Abbé's seedlings, and it is still grown in this country. The other fruits of Hardenpont are less known in this country. Délices d'Hardenpont, Fondant de Panisel and a few others have now lost their former popularity.

Owing to the fact that Hardenpont was not much in touch with horticultural circles, it was some time before his fruits were widely distributed, but in 1806 Noisette visited Belgium, and there saw and at once appreciated these striking novelties, and through him they were soon distributed over Europe. The interest aroused by these new fruits naturally encouraged imitators, and pears seem especially to have been the fruit which attracted their attention. In 1787 M. Capiaumont, a chemist at Mons, raised from a seed of the Calebasse Pear the variety which still bears his name. For a while it masqueraded under the name of Beurré Aurore, and by this it is described and figured in *Le Jardin Fruitier* of Decaisne. The fertility and hardiness of this fruit have led to its cultivation in many countries.

The greatest figure in Belgian pomology is undoubtedly that of J. B. Van Mons. His extraordinary labors and unfailing perseverance resulted in the production of an enormous number of new fruits, which probably no

raiser has ever equaled.

Van Mons' influence in stimulating others cannot be over-emphasized. The very fact that he set out to prove a new theory gave zest to the endeavors of his followers, and though his hypothesis is now seen to be baseless, its promulgation was of great value to Belgian pomology. His experimental garden suffered severely at the hands of the French army in its march on Antwerp, but his courage in removing what could be saved from the ruin and starting again elsewhere are worthy of the highest praise. After his death the mantle of Van Mons fell upon Alexander J. D. Bivort, a pomologist whose name will be remembered by his splendid Album de Pomologie, which contains colored figures and descriptions of the best of Van Mons' seedlings. Bivort had long been on terms of friendship with Van Mons, and he purchased all the seedlings then at Louvain and removed them to his garden at Geest St. Remy, near Jodoigne. Here the work of describing and figuring them was carried on for many years, and the results published in the Album de Pomologie, above referred to, and in the larger Annales de Pomologie Belge et Etrangère. Bivort claims attention chiefly as a systematic pomologist, and as such was a necessary complement to Van Mons.

In 1853 Bivort was obliged to leave St. Remy, and a new society, called the Société Van Mons, was formed under government auspices to continue the work. Bivort was chosen as director, and a journal was published. However, after a few years, the state subvention ceased

and the establishment was given up, and thus the original trees of Van Mons perished. The work of Bivort in preserving and recording these seedlings was of the highest importance, and assures him a high place in the pomological hierarchy.

Prominent among Belgian fruit raisers must be reckoned Major Esperen, one of Napoleon's officers. This gallant soldier saw much service before settling down to the peaceful occupation of fruit culture. Joining the army as a volunteer in 1803, he was wounded at Wagram, and promoted lieutenant on the battlefield. Afterwards he took part in the campaigns in Germany, Russia and Tuscany, retired in 1817, and devoted his time to the raising of seedlings, some of which are still in the first rank. The best known varieties of Major Esperen's raising is Josephine de Malines, which was produced in 1830, and named after his wife, Josephine Baur. Scarcely less well known is Emile d'Heyst, which first fruited in 1847. and was dedicated to Emile Berckmans, son of the wellknown pomologist of Heyst-op-den-Berg. Another pear, Elisa d'Heyst, named in honor of Madame Berckmans, has not been so widely grown. Esperen's name is happily kept in memory by the well-known Bergamotte Esperen, which first fruited in 1830, and rapidly became known as one of the very best of its season. Another pear, Soldat Laboureur, whose name bears reference to the career of its raiser, has never been much grown in this country, but it may still be found in many gardens in Holland and Belgium. The well-known Plum Reine Claude de Bavay was another of his seedlings, and was dedicated to Madame de Bavay, wife of the director of the Royal Gardens at Vilvorde. Esperen was the raiser of many other seedling fruits, some of which may still be found in Continental gardens, and his stringent selections made them all of very considerable merit. To have introduced three such valuable fruits as Josephine de Malines, Bergamotte Esperen and Emile d'Heyst is no inconsiderable achievement.

Another raiser of fruits who had considerable success was Xavier Grégoire-Nelis, of Jodoigne. His seedlings

were extremely numerous, but few of them have found acceptance in this country. The best known are Zéphirin Grégoire, one of the most delicious winter fruits, and Nouvelle Fulvie, which was raised in 1854. The somewhat curious name of this fruit is accounted for in the following manner. In 1845 M. Grégoire raised a variety called Fulvie Grégoire. When, however, in 1854, Nouvelle Fulvie appeared, its qualities were such an improvement that it thus received its name as a supplanter of Fulvie Grégoire.

While the above-mentioned horticulturists stand out as leaders in Belgian pomology, the raisers of pears may be numbered by scores, and it is impossible to deal with them exhaustively. Some of these have only one fruit to their credit, but in the case of M. Durondeau, a brewer of Tongres, Hainault, and M. Capiaumont, who was mentioned above, there is no danger of their names being forgotten.

Of the many chance seedlings of which the origin is unknown, the most famous are Beurré Diel and Calabasse Bosc. The former was found by Meuris, the well-known gardener to Van Mons, at a farm near to Vilvorde, and the tree was still existing fifty years ago. Scarcely less tamous is Calabasse, a discovery of Van Mons in the garden at Linkebeek.

It must not, however, be thought that pears alone occupied the attention of Belgian pomologists, though they did so to a very large extent. Other fruits recall by their names many Belgian towns, such as the well-known Plum Belle de Louvain, the Cherry Abbesse des Oignies, Cérise de Gembloux and many others.

But enough has been said to show the important place Belgium has filled in the history of pomology, and we may be sure that when the present war is over and the Belgian cultivators are once more able to devote themselves to their peaceful occupations, the memory of their famous pomologists will serve to inspire them with renewed zeal for a profession which they have always practiced with such conspicuous success.—From Gardeners' Chronicle (British).

VIEW OF THE FALL SHOW OF THE HORTICULTURAL SOCIETY OF NEW YORK. IN THE EACKGROUND ARE THE WONDERFUL SPECIMENS OF BUSH CHRYSANTHEMUM PLANTS FROM THE ADOLPH LEWISOHN ESTATE, ARDSLEY, N. Y. (JOHN CANNING, SUPT.) IN THE FOREGROUND ARE SOME OF F. R. PIERSON'S NEW VARIETIES OF ROSES.

# Bulbs in the Ornamental Garden

By Maurice Fuld\*

The plan of carpeting bulbs with other plants of a very different habit is now very general, but not so universal as it should be. Many people who are delighted with the beauty of bulbs in the grass will yet grow the same bulbs in beds or borders on the old regimental system, and they do this, probably, because they think it saves trouble to the gardener. It is so easy to fill a bed with Tulips in the autumn and then to lift them when they have gone out of flower to make room for summer bedding. But it is just as easy to combine them with plants such as Pansies, Forget-me-nots, the double Arabis, and many early flowering annuals, which may be removed at the same time to make room for the "summer bedding."

Progress in methods of gardening have been exceedingly slow in the past and one would have to expect the impossible if all the recommendations made in the foregoing article were at once adopted universally and the old-fashioned methods entirely discarded.

In view of this fact it is necessary to give here a few of the usual methods adopted in the growing of bulbs in everybody's garden.

THE AVERAGE COUNTRY GARDEN.

A flower bed, or what is known as such, is either in the form of a circle, or oblong, or square, or in ornamental shapes as stars, crescents or ribbons.

Here we will find during summer our popular tropical bedding plants, such as Salvias, Cannas, Geraniums, etc. When frost has killed the plants (about October or November) more, as a rule, in November the beds are cleared for the planting of bulbs for a spring display. Hyacinths, Tulips and Daffodils usually vie with each other in these beds.

\*By permission, from his boot, "Growing Bulbs,"

After bedding plants have been removed, cover your bed with a liberal quantity of well decayed cow manure, and if this is not obtainable use "Pulverized Cattle Manure," a very inexpensive and efficient bulb food, and spade the bed then thoroughly and quite deep for the manure or fertilizer must not come in contact with the bulb.

Bulbs must never be planted in beds which are not thoroughly drained or where the water stays long in the spring time, for such conditions spell absolute death to the bulbs.

It is advisable to form the beds sloping from the centre to the edge, for this will cause the surplus moisture to run off, particularly when the snow melts in the spring time.

The next question arises, How far apart should bulbs be planted? The solving of this question rests entirely with the individual, but this much cannot be disputed if solid effects are desired. Tulips should not be farther apart than four inches; Daffodils, five inches, and Hyacinths, six inches.

Color, height and season of blooming must be carefully considered if more than one variety is combined in a single bed.

In Hyacinths, varieties should be selected which produce an erect spike and not such as are top heavy, and must be supported.

In Tulips, heights and season of blooming are the important factors to consider.

Daffodils should never be mixed in a bed, but only one variety in one place gives the best result.

THE PROTECTION DURING WINTER.

I do not recommend the use of manure such as is commonly practiced for this has been the cause of more

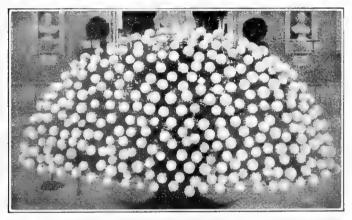

GENERAL VIEW OF MAYN HALL, FALL FLOWER SHOW, PENNSYLVANIA HORHOL - 1421 SOUTHLY, 1461 5

trouble than satisfaction. The best protection is either dry leaves, salthay or straw pinned down by boughs of evergreens. The latter in itself is sufficient. No protection should ever be given until the cold weather sets in. Protection is not required for the purpose of keeping frost out, but mainly to keep the frost in and its real worth is manifested in March when warm spells thaw the ground and encourage the bulbs to come through, only to be nipped by the first cold night. Do not remove the covering at the first sign of spring nor let it remain too long, but judge by weather conditions.

A sprinkling of pulverized sheep manure over the bed as soon as the covering has been removed will help materially to improve the size of flowers.

THE ITALIAN GARDEN.

Here the use of regimental beds of gaily colored

FANNED SHAPE SPECIMEN PLANT FROM ADOLPH LEWISOHN'S ESTATE, AT NEW YORK SHOW.

Hyacinths and Tulips and the golden Daffodils find the setting that nature seems to have designed for them. The very fields of Holland with their squares of scarlet and yellow and blue and gold and the tender shades of pink and lavender and white can be duplicated here.

The real effects, though, can only be achieved through masses, and quantity counts here more than quality.

Close planting is essential. Color combinations may be suggested, but after all they should be the product of the individual and the expressions of his own taste. A study of varieties, their character, heights, flowering season and color is absolutely essential to create the most pleasing effects.

The carpeting of other flowers through which these bulbous flowers rise add a particular charm to this style of garden and should be universally followed. But another effect I have in mind which the author of "Studies in Gardening" has entirely overlooked. If between the Hyacinths and the Tulips and the Daffodils you plant "Pushkinnias" thickly so as to carpet the unfilled space a perfect carpet of "heavenly blue" will greet your eye the first thing in the spring, long before the leaves of the Hyacinths or Tulips or Daffodils can spoil the effect.

By a careful selection of varieties and material the gay bulb season can be extended from earliest April until early June.

Pushkinnias appear first, then follow in rapid succession Crocuses, Scillas, Hyacinths, the Single Early Tulips, Jonquils, Single Late Tulips, Daffodils, Double Tulips, Poet's Narcissus and Darwin Tulips. All these are showy species and fit within the borders of a well designed Italian Garden.

The method of culture differs from that described in that the Crocuses and Pushkinnias should be planted but one inch deep. THE HARDY BORDER.

Again I wish to submit here an extract from "Studies in Gardening," as follows:

In the herbaceous border, however, the problem of the right use of bulbs is less easy; and yet it is not very difficult. True, there are many bulbs which are best lifted as soon as they die down, and there are others which resent disturbance at the very time when the border may need to be dug over. But both these difficulties may be overcome with a little contrivance and foresight. Take, for instance, the country garden, in that the Crocuses and Pushkinnias should be lifted at least every other year. These may be planted in considerable masses among carpeting plants or in clumps of eight or ten surrounded with plants that will contrast with them; and they may be taken up without difficulty when they have died down, and without injuring the plants about them. The arrangement in clumps is best suited to the taller May flowering Tulips and to other tall bulbs such as the Camassias, English and Spanish Irises, Crown Imperial Lilies, most of the true Lilies, and Snowdrops. Some of these, especially Madonna Lilies, resent disturbance, and it is the bulbs which resent disturbance that we have learned to grow in the most beautiful and rational way. No doubt, if Madonna Lilies could be treated like Tulips, they would often be bedded out like Tulips, and all their beauty would be spoiled. As it is, we grow them in the border and treat them like herbaceous plants, with excellent results. We should extend the same treatment to other bulbous plants, so far as their needs will allow. Thus, the May flowering Tulips should be planted in

COLLECTION OF ORCHIDS FROM P. A. D. WIDENER ESTATE (WM. KLEINHEINZ, GARDENER), AT PHILADELPHIA SHOW.

clumps of eight or ten at regular intervals along a border, and if a hundred or more of the same kind—say, of Gesneriana or Picotee—are then planted in the same border, they will produce a brilliant effect of color just when it is most needed, whether in contrast with flowering plants about them such as Wallflower or Forget-me-nots, or with shrubs not yet in flower, such as Lavender or Santolina. And, if necessary, they may be lifted when they die down, just as Wallflowers and Forget-me-nots are taken up when they go out of flower, and other plants or bulbs may be put in their place.

The later and larger growing bulbs are much easier to deal with in the border than the many little bulbs that flower early in the spring and then die down and remain dormant until autumn. It is possible, of course, to lift bulbs like Crocuses, Scilla Siberica, Scilla Bifolia, the Chionodoxias, the Pushkinnias, and the Muscaris as soon as they are dormant, and to plant them again in the autumn. But it is a troublesome business; and many of them do better if left undisturbed. Yet, though they make the border beautiful in early spring, they leave blank spaces just when it is expected to be fullest. If they are to be grown in the border they can be covered with Sedum album, which will not interfere with their

grown in the grass, where it is not too thick and coarse; but it usually thrives better under a Sedum.

When the foregoing was written the author evidently had not yet recognized the "Darwin Tulip" as the most popular bulbous flower to be used in borders.

It is wonderful how popular this majestic Tulip has become within the last three years and yet one should not be surprised for its merits deserve its popularity. Art shades such as mauve, wistaria, lilac, lavender, bronze and purple are found in all tones among hundreds of varieties offered today.

I shall refrain from suggesting superior up-to-date varieties, for the introduction of scores of novelties each season would make any selection obsolete in a comparatively short time.

Darwin Tulips in the hardy border should be planted with the set purpose in mind never to disturb them unless they have degenerated into poor, unsightly flowers; then they should be lifted and discarded and new bulbs should take their place. Before planting Darwin Tulips the spot where they are intended to be planted should be well prepared by removing the soil to a depth of two feet and placing in the bottom a layer of well decayed stable manure, fully six inches deep. The balance of the soil to

EXHIBIT OF ORCHIDS BY LOUIS BURK (CHAS. WURST, GARDENER), AT PHILADELPHIA SHOW, EVERY PLANT WAS TAGGED WITH A NUMBER; THE KEY TO THE NUMBERS WAS IN THE BOOK HANGING ON CASE.

growth, and which is green all the winter and very pretty when in flower. In this case they must be planted well in the front of the border as the Sedum, if it is to do well and flower, must not be overshadowed by other plants. But, indeed, these smaller bulbs always do best in the front of the border, as they are apt to be forgotten and dug up if they are among large herbaceous plants, and also they do not get the summer sun which most of them need to ripen them. It is also possible, of course, to sow some low growing hardy annual over them, especially over the Scillas and Chionodoxas, which like to be planted deep in a light soil. But this is not so easy to manage with Crocuses, which like to be planted just under the surface. The best plan of all, perhaps, with these little bulbs is to plant the Crocuses and Muscaris in the grass, where they will thrive, and the Scillas and Chionodoxas and Pushkinnias on some sunny bank which they can have to themselves. Such a bank may be carpeted with Sedum with excellent effects. Scilla Siberica may also be

be replaced should be well mixed with ground bone, but where the bulbs are set the soil must be pure. Darwin Tulips should be set six inches deep so that you can plant annuals such as Lavatera or Gypsophila right over them when they have ceased blooming.

What would otherwise be a barren spot can be a sheet of color for the balance of the season. Next to the "Darwin Tulips" the other classes of late flowering Tulips should be more frequently employed; for instance, the Rembrandt Tulip with its wonderful markings, the Breeder Tulip with its sombre color, the Bybloomen and Bizarres with its fantastic stripes and flakes, the newer sorts of Cottage Garden or May Tulips which are as gay as the "Swiss Sennerin," and last but not least the family or species of Wild Tulips, these more than all the others are by nature fitted for the hardy border, for all perennials are only cultivated wild flowers. The Wild Tulips do wonders when they receive a taste of prosperity, and some varieties are without doubt superior in colors, markings

and effectiveness to all the cultivated sorts. Tulipa Kaufmanniana, T. Thubergeniana, T. Sprengeri, T. Clusiana, T. Greigi and many others are real jewels among flowers.

The selection for the hardy border is more extensive than for any other purpose in gardening and all of them should be used to make the border truly what it was planned to be, "the roaming place for all hardy flowers."

#### THE ROCKGARDEN.

This style of garden, while yet an unknown quantity in this country, will in the writer's opinion become one of the most popular styles of gardening in the future. Some of the most lovely hardy plants are only at home in the rockery, and this holds particularly true of the smaller bulbous flowers. The well-built rockery can provide every condition these flowers demand; for instance, drainage and protection. The species of wild Tulips also known as Mountain Tulips find here the exact duplicate of their native home and many varieties can be made permanent here. Their season of blooming extends over a long period of time, even of a single variety, so that when planted in clumps one finds some of them in flower, some in bud and some already past.

Tulipa Kaufmanniana does exceedingly well here, for it needs sharp drainage. It was introduced only a few years ago and is almost the earliest to flower and the most beautiful of all tulips. Early in April or sometimes in March its blossoms begin to open, at first creamy white and then flushed with pink on the outside, while the inside has a golden centre like that of a water-lily. It seems to withstand the severe weather well and it is not unusual to see its great blossoms open above snow-covered ground. Tulipa Biflora, a beautiful little species with several white blossoms on a stalk is another beauty. Tulipa Lownei, a dwarf tulip with delicate pink blossoms, and T. Pulchella, a pretty red tulip marked inside like a calochortus, seems to thrive here. Tulipa Linifolia, rather late, when planted in large clusters appears like a

glow of scarlet. All these bulbs look best rising through a carpet of Sedum, whose roots are too shallow to interfere with the bulbs and whose leaves are not thick enough to prevent them from ripening well in the summer.

In fact, all the species usually offered may with safety

be adopted for the rockgarden.

There is a class of Daffodils that by nature must have been designed for such a garden, for this style of garden demands flowers which are rather prostrate or dwarf in habit of growth, and invariably with such plants the flowers are rather of miniature size.

The following varieties I should recommend: Tenby Daffodil, Princeps, Queen of Spain, Cyclamineus, all varieties of Bulbocodiums, Triandus Albus, Nelsoni Minor, Jonquillas, Juncifolius, Diomedes Minor, and Montanus Poculiformis. Of Hyacinths the class of Muscaris are ideal, such as Grape Hyacinths, Feathered Hyacinths and Muscari Azureum, the latter flowering as early as February if weather permits.

#### THE FALL AND WINTER GARDEN.

Who does not cherish the Witchhazel blossom in

February or the first Snowdrop in March?

With proper selection of material one can have something in bloom from November until April. Start with Sternbergia; planted in October, its bright golden Fairy-lily like flowers cover the ground in November; the Colchicums planted in September are still gay in colors; Crocus speciosus is just coming into bloom and C. Sativus and C. Zonatus follow it in December.

If you have a clump of evergreens facing the south, or you have a warm border on the south side of the house, plant a few bulbs of Crocus Imperati and its blue blossoms will greet you the first sunny days in January and as often in the month as we have sunny days.

offen in the month as we have sumy days.

If you have a cluster of trees under which the cold winds find no entrance, plant a few clumps of Chirstmas Roses (Helleborus). Even through the snow they will

GARDEN SCENE AT MADISON, N. J., FLOWER SHOW, ARRANGED WITH CHAS. H. TOTTY'S COLLECTION OF CHRYSANTHEMUMS.

push their cherry faces of white and say "Hello" to you in February. Other species of Crocus would flower every week in the winter if a sheltered nook, where the sun can reach them, was chosen for them; and so we could make our garden so interesting during the winter that there would be no need of putting it out of our memory for three to four months.

### CHRYSANTHEMUMS FOR EXHIBITION.

After the shows are over look to your stock for the coming year. Select as many good healthy shoots as required, seeing that each variety is labeled correctly; keep clean from mildew and fly; and when the propagating time is at hand select the sturdy cuttings and insert in the bench already prepared, watering in thoroughly. This will carry them for a few days, besides firming the cuttings. Keep them sprayed lightly to guard against wilting.

They should be rooted in about three weeks; then pot up in 2-inch or  $2\frac{1}{2}$ -inch pots with a nice light compost, but do not firm sufficient to injure the roots. As soon as they are established give an abundance of air to keep them firm and sturdy, but never allow them to become root bound.

It is essential to have the pots thoroughly clean in order to transfer them without injury. Repot into 4-inch pots with a nice compost consisting of three parts of fibrous loam to one part leaf soil and one part decomposed manure, adding charcoal, wood ashes, sand, etc. Place in a house or frame and keep closed for two or three days. Many people bench from 4-inch pots, while others prefer the pot grown, which latter I am strongly in favor of.

When they become nicely rooted, repot into 6-inch pots, using practically the same compost, but coarser, besides adding a little bonemeal. Keep a sharp lookout for mildew and fly; also to the disbudding. Should the plants not show a natural break at this stage, it is policy to pinch in order to encourage the next break.

When the pots become well filled with roots, an occasional watering with diluted liquid manure or soot water may be given with advantage. A spraying overhead with the latter is also beneficial as an insecticide and stimulant.

See that the plants are hardy and well-rooted before placing into final pots (7-inch to 9-inch). Perfect drainage is most essential.

The soil should be well rammed, allowing a space of 2 inches for watering and top dressing. For compost use

four parts fibrous loam, one part leaf soil, one part decomposed manure, adding lime rubble, wood ashes, charcoal, sand, soot, and allowing a 6-inch pot of bone or bonemeal to each of loam.

Feeding may be commenced as soon as the roots are found to be running freely, by applying weak doses of liquid manure water. Change the feed sometimes as time goes on, using chemical manure such as Clay's, Bon Arbor, etc., which will be found most beneficial if used with care and according to directions. Never apply manure when a plant is dry.

About the middle of June some varieties not making a natural break, such as F. S. Vallis, Harry E. Converse, Mrs. Lopes, etc., will need pinching to make them produce bud early in August. This allows about six weeks for the last break; later varieties should be timed accordingly.

About the tenth of August many of the buds will be ready for taking. After this date it is safe to take all buds as soon as they become large enough to handle without injury. In disbudding discretion must be exercised by removing a few at a time. Keep the plants nicely staked, tied and clean.

After the buds are secured look out for their worst enemy, the red spider, which will give considerable trouble if they once get into the blooms. To avoid this fumigate once a week until buds show color; continue spraying foliage on bright days, avoiding the buds, which will rot if the water is allowed to settle in them. Also beware of the hairy caterpillar, which will ruin the foliage. Shade is sometimes necessary to guard against the burning of the petals during hot, bright days, the bronze and red varieties being more susceptible to burning than the other colors.

Cut blooms intended for exhibition are greatly benefited if put in water twenty-four hours before shipment. In packing, the blooms travel much better if wrapped with a full sheet of soft tissue paper, which is quite easily done by slitting the paper at the fold, inserting the stem in the slit just below the bloom, then gathering the folds and fastening at the top of the bloom with a gentle twist.

In staging, see that all blooms are fresh, unblemished, and preserve as much foliage as possible in the long stem classes, as fresh blooms with good foliage generally capture the most points.

## The Gardener and His Profession

By W. N. Craig.

I need not say how ancient and honorable is our calling, and surely the Almighty, when he placed our earliest forefathers in the Garden of Eden, must have given them a glimpse of Paradise itself. We, their successors, in these later years, while we may often complain of our lot, should remember that as tillers of the brown soil, we have at once the most lovable, fascinating and enthusing of professions. We work in the most wonderful laboratory in the world, and even though many of us may not have the scientific attainments we might wish, in spite of some discouragements, failures, and possible drawbacks, we know and feel as much of the great secret of life itself as those who spend countless hours reading and soliloquizing over protoplasm, and the essence of all being. We plant, prune, sow, and reap, of not only things horticultural, but faith and hope. We garner rugged natures, and given rude health, our sleep, in spite of unavoidable worries, is so sound and sweet, that frenzied financiers and moneyed kings would fain have the comparative freedom from care and restful repose which is

The very word "gardener," to come back to the more practical part of our subject, is ofttimes a misnomer. The United States Census statistics state that gardeners outnumber florists over two to one. I do not know who are classed as gardeners. Probably jobbing gardeners, market gardeners, and the general handy men who earn some considerable portion of their income from caring for gardens, are included in this category. What I have to say will refer to only a small fractional part of this body, commonly known as private gardeners, but more correctly as professional gardeners.

The gardener is, or *should* be, not only one who is a florist, but very much more; he should have a good general knowledge of horticulture in its broadest sense, and this is not by any means all, for there are an increasing number of calls for men who are good gardeners but who in addition are capable of handling all details of estate management, and the man who is to fill these positions must be wide awake, energetic, eager to learn, and never satisfied to muddle along in any happy-golucibus ways as is too often the case to day.

lucky way, as is too often the case today.

To be a good practical gardener in itself requires a great deal of care and forethought; I doubt if there is any other occupation which requires one to have his senses more keenly alert. A trifling omission today, or a little oversight tomorrow may seem unimportant at the time, but may cause much worry and anxiety at a later date. One of the best friends a gardener can have is a carefully kept *diary* of operations, of the weather, time crops mature, etc. I was advised when a boy to keep one, and have continued it religiously, and I can honestly say that for the little time necessary to keep it, no gardener should be without it, particularly would I urge upon young men to do so.

I have often been glad that in my early gardening days I had the rare good fortune to serve under one who was not only a good practical gardener, but a good botanist. I still highly prize a collection of 420 varieties of the British flora I collected after work hours, while I was still a journeyman. I wish I knew *more* botany: it is of great help to every practical gardener. We often hear the remark that good botanists never make good gardeners. This is not at all true; where could we get a hetter example of both than in one of our fellow members—the respected superintendent of the Harvard

Botanical Gardens (Mr. Cameron). The value of botany may not be very apparent while you are young, but its knowledge will be very helpful as you advance in life.

The majority of us have not had the advantage of college, or even high school training; and it says much for the grit, perseverance, and skill of many who, spite of these educational drawbacks, have risen to good positions and are in many cases leaders in their profession. Times, however, are changing, new conditions have arisen and now face us, and we must equip ourselves to meet them. I refer more particularly to the so-called college graduates who are being trained to fill posts such as we now

occupy.

I believe largely in a college course, and that the young man who can have both a horticultural and agricultural training in such colleges as Amherst or Cornell, while they may gain less of the really practical work than on a private estate, will gather, nevertheless, a good theoretical knowledge of the fundamentals of our profession, and will, in many cases, be more eager for knowledge and quicker to learn than those who have started at the foot of the ladder and are slowly but diligently plodding along in the regulation way. I have sufficient faith in the college course to recommend it to any who are able to send their boys there. Certainly, if any of my own boys show a sincere desire to follow in their father's profession, I would feel it were money well expended to send them there.

I think, however, that the college bogy has been held up too much. I don't believe that a college course at all fits a man for assuming charge of even a small estate. The drawbacks in our agricultural colleges today are, that really practical men are to a large degree lacking. I don't mean to infer that the professors are not bright, intelligent men; but how many of them have had any great degree of practical horticultural training? When our colleges select men who are first-class growers to have charge of their greenhouses and grounds, men who will be free from petty interferences, from the more purely theoretical teachers, then they will turn out young men who can with greater confidence apply for positions where practical worth is needed. Even then, I doubt if such men would be competent to take charge of any positions before spending a year or two on some private estate.

Let us, however, be fair; let us be tolerant; remember that these young American boys should have a helping hand and not be sneered at, rebuffed, and discouraged. Do not forget that, while we may pass through life without a college course, in the years that are coming the need of more scientific attainments will be greater than now, and botany, chemistry, and other essentials will be much more necessary. The practical gardener of the future, the estate manager of the future, must know these things, and he who thinks otherwise will be woefully left

in the procession.

Then we have, or may have, competition from another source. I refer now to the so-called landscape gardeners, or architects, as some prefer to call themselves. To some of these, men on a high plane, with a national reputation, we would all be ready to doff our hats; but there are now a veritable flood of these embryo landscape gardeners, female as well as male, being turned loose on suffering humanity. I don't refer for a moment to the jobbing gardener or florist who has the magic words "landscape gardener" printed on his letterhead, but to the more cultured product of Amherst, Technology, and Harvard.

Situated where I am, I have abundant opportunities to see and study these rising, active, and intelligent young men. They are being turned out in such numbers that I wonder what must become of them all. Now, I have noted that nearly all these youths, and their teachers, can talk pleasingly on landscape designs, but that so far as practical gardening is concerned, they know very little indeed. Yet these men are intruding themselves upon those who have forgotten more of horticulture than their new fledged landscape artists know, and in not a few cases are allowed to draw plans, make changes, and suggest or even superintend plantings for which they are grossly unfitted. I think I am safe in saying that not one landscape gardener, architect, or artist—choose whatever term you like best-in ten, is competent to draw up plans, suggest proper plantings, and see such carried out.

I will take up another question, one which is of vital importance to everyone. I refer to gardeners' remunerations. I know many gardeners are getting too small a salary for the work they are doing. I know also that others are overpaid for the little they do and produce. I know further that on an average the scale of wages may seem low compared with that secured in other professions where a comparatively low degree of skill is needed. But conditions have much improved in 25 years, the rate of remuneration has advanced, and I believe the average practical gardener is, on the whole, more appreciated than a quarter of a century ago. We must always remember that gardening is more or less of a luxury; we cannot fix or regulate salaries by any trades union, cooperative or other method; any such efforts would prove

disastrous to our profession.

We can, however, instill in the minds of our employers that confidence, and almost intimate relationship, which should exist between employer and employee. Such noted British patrons of horticulture as the Duke of Portland, Sir George Holford, the Hon. Vicary Gibbs, Sir Jeremiah Colman, and others I might name, look upon, and speak of their head gardeners as friends rather than employees, and are not afraid to say so on public occasions, when both are present. I feel we are approaching in some measure that condition here. Once real confidence exists, wages will regulate themselves. Let us do our work so well that our employers will feel that an advance in salary is well merited. All employers are not equally appreciative, however; some there are who give praise grudgingly and find fault unstintedly. It is not necessary, however, for any first-class gardener to continue indefinitely with such, for there are many kindly and appreciative employers who would not starve the very souls of their employees for want of a few kind words, as some are doing.

Now, fellow members, you may not believe it, but I do, that the principal reason why a great many of our members make no headway, is, because they fall considerably below the requirements of their employers. They don't measure up to their opportunities; in short, they are stand-pats, and not progressives. I feel also that our profession is retarded, and seriously retarded, by a large proportion of the men within its ranks. There should be a weeding out of this incompetent and undesirable material. How it can best be accomplished, I cannot say. Many have no right to the name of gardener. Such men should never be recommended to positions of trust by

those who are asked to fill them.

Co-operation is in the air, and here I can see hopes of much benefit to our craft. The National Association of Gardeners is accomplishing a good work, not only for its own members, but the profession generally; and I advise every gardener not yet a member, to join it. This is the only purely private gardeners' national asso-

ciation in America, and the only one, in my estimation, which can be of real benefit to our members. While we have the friendliest of all feelings for the various trade bodies—I belong to at least five of these myself—and are always willing to help them in every possible way, we must remember that they have their own problems to face. We also have others fully as complex. We cannot in any trade society get that sympathy and ready support that is forthcoming in a body largely confined to practical gardeners; therefore, if we can belong to but one national society, let it be the National Association of Gardeners.

As each year rolls on, our perspective changes, and I want to say that it is changing very fast in favor of outdoor horticulture. I am not underestimating the value of greenhouses; they are, however, not of vital importance; many first-class places have little glass, some none at all; probably these greenhouses are visited a few times yearly, at most. They serve their purpose, but are invariably placed in as inconspicuous a place as possible, so as not

to be a blot on the landscape.

Now, the outdoor department is ever in view, and more men should equip themselves to handle this part effectively. Trees and shrubs, their proper planting and care; hardy herbaceous plants; bulbs, both naturally and formally planted; tennis courts, their formation and care; fruit trees and their care; tree surgery, including both pruning and cement patching; spraying, now of vast importance; proper rotation of farm and garden crops; live stock and their care; bird protection—our winged aerial fleet is of supreme importance—these are a few subjects we should all be conversant with.

Then again, do not let us give every moment to our estates; we need some relaxation, such as the fraternal orders offer us; but let us, wherever possible, be of some little use to the community in which we reside; we can all assist in civic betterment, by aiding in the home and school garden movement, by encouraging the proper planting and caring of trees on our streets, by helping along the public grounds movements, and in other little ways trying to make conditions more pleasurable for young and old. We will get no salary for this, but there is the satisfaction of knowing that you are doing good to others.

I have often heard gardeners speak contemptuously of book learning, and have even heard some say that they never read a horticultural paper. Such men are to be pitied—they are never found in the van of progress. Our American horticultural papers may not be all that private gardeners could wish them to be, but they are filling their field acceptably, and every gardener should patronize one or more of them. Their price is low, and none of us are so advanced that we cannot learn something each week if we will do a little careful reading. I wish more gardeners would send communications to the horticultural press, as is done in Europe; I am sure the editors of all the papers would welcome such.

I want to see our noble profession better recognized than it is today, to see its craftsmen more looked up to and esteemed, to see a better feeling existing between employer and employee. Let us all, therefore, labor unitedly to seek each others' welfare in a better grasping of the needs of our calling, and try to be of special help to those who need our aid the most, and remember that we who are constantly working assiduously in Nature's boundless workshop are working at the same time very close to the great Creator of all life; therefore let our lives be as harmoniously beautiful and bountiful as are the works of Nature's God.

Extracts from a paper read before the Gardeners' and Florists' Club of Boston, November 17, 1914.

## Work for the Month of December

By Henry Gibson

THE FLOWER GARDEN. (WINTER PROTECTION.)

We have reached a period of the year when severe cold may be expected any time, and winter protection should be afforded whenever necessary. It is not a good plan to rush this work ahead when the weather is warm or it is likely that any benefit to be derived from giving the plants winter protection may be undone. Generally speaking, it is better to delay putting on any covering until the ground is well frozen. Then the mulching of whatever nature it may be will keep the ground frozen, which is just what is needed.

Alternate freezings and thawings are bad for any plants, and especially those which have to stand the ex-

treme cold of winter.

Dutch bulbs should not be covered until the ground is well frozen. If covered before, frost will be practically excluded, and the soil thus remaining soft the bulbs have every opportunity of pushing ahead and when the time comes to remove the covering in the spring it will be found that the tulips and hyacinths will have such long and tender growths that even with the greatest care in uncovering many will be broken.

### HARDY ROSES.

Drawing up the soil to the centres of hybrid perpetual roses will be sufficient protection in the meantime, and a heavier mulch of litter may be applied later. In sections where it is extremely cold it may be necessary to wrap the stems in straw in addition to mulching with leaves and soiling up.

### Pansies.

Where pansies are wintered in cold frames it is an easy matter to carry them through successfully by scattering a light coating of dry leaves over them. But be sure that they are dry; damp leaves soon weigh down the plants and cause decay. As the cold weather advances place sashes over them, taking care to air freely during warm spells.

To winter successfully outdoors pansies should be planted on well drained ground. Leaves are excellent covering where they can be held in position, but in windswept locations this is difficult, and under such circumstances, straw, salt marsh hay and similar material make

the best covering.

### RHODODENDRONS.

These are only hardy in the colder sections of the country when well protected. Often a good wind break of boughs will be found sufficient, and in other cases it may be necessary to put on a heavy mulch of leaves and erect a heavy frame work of evergreen branches above and around the beds. Where evergreen covering is hard to obtain, burlap may be used to advantage, but when this material is used provision should be made for a free circulation of air about the plants or much harm may result. Having adequate moisture at the roots is an important factor in the wintering of not only Rhododendrons, but other evergreens as well. More losses during the winter are due to drought than any other cause. Then, again, location has a good deal to do with how they come through. Those well shaded from the morning sun will in all probability come through all right, while the same plants in a southern location would be scorched or killed outright. We all have noticed the brown

scorched appearance of evergreens above the snow line, and especially on the south side. This scorching is undoubtedly caused by dryness at the roots. The heat of the mid-day sun causes a demand for moisture from the leaves, which cannot be supplied owing to the dry frozen condition of the soil.

## PROTECTING EVERGREENS FROM SNOW.

While on the subject of protecting evergreens it may not be out of place to say a word regarding their protection from snow. The disfigurement of evergreens by being weighed down with snow is happily not so common a sight as it used to be. Gardeners are beginning to realize that it is to their advantage to attend to this before heavy snow storms are due. By dislodging the snow the branches of these trees may regain their proper position, but many of us know from experience that this trudging out to dislodge wet, heavy snow, and tie in the branches, is no pleasant task on a stormy day. Nor is it necessary, if proper attention be given this work while the weather is fine and dry. This consists of tying in the branches with string or rope, and occupies but a short time compared to what it would take to replace the damage done, were it neglected.

Moreover, there are evergreens that are not as hardy as others and this tying in would, in a measure, be extra

protection from the cold.

### THE GREENHOUSES.

With the advent of colder weather, and consequently, the increased use of fire heat, it will be necessary to damp the walks in the house frequently to prevent having a dry arid atmosphere. In such an atmosphere our arch enemy, red spider, revels, and once he gets himself established its no mean undertaking to get rid of him.

The cement paths usually found in private greenhouses are very nice to walk on, and neat to look at, but they don't hold moisture as does a path covered with gravel or fine ashes, so keep the hose in use, when you are firing

hard.

In houses where a night temperature of from 65 to 70 degrees is maintained it won't harm a bit to damp down the path, when the fires are being attended to at bedtime. We have done it in a rose house, when firing heavy and the atmosphere felt arid.

### SWEET PEAS.

The plants which were raised from seed last August will bloom this month, and will be benefited by a little feeding, but care should be exercised in doing this with the short dark days upon us, or the plants may drop their buds. Cow manure well diluted is safe to use, or a light dressing of fine bone, pulverized sheep or cow manure can be applied. Strong chemical fertilizers at this time of the year should be avoided. A dose of nitrate of soda water and a succession of dark dull days would result in wilting the first day the sun was out.

### VIOLETS.

The whole of the shading should be cleaned off the violet houses, now, if not already done. Violets grow and thrive luxuriantly in the deep shade of the woods when growing naturally, but to obtain the best results when forced during the winter months they should have all the light possible.

## HERE, THERE AND EVERYWHERE

## OPPORTUNITY TO EXPERIMENT WITH FOREIGN PLANTS.

The Bureau of Plant Industry, U. S. Department of Agriculture, is about to issue its catalogue which will describe over 300 species or varieties of new foreign plants, most of which have not been grown to any extent in this country. Familiarity with them is consequently very limited, and they are not like standard seeds and plants, the hehavior of which can be predicted with more or less certainty. They have been imported for trial because of some direct or indirect use which it is believed can be made of them by Americans.

These plants are introduced primarily for use by the Federal and State Experiment stations of the country, but are available to such private growers as have the necessary facilities and are desirous of testing them, notwithstanding the fact that they are quite untried commercially. Since these plants must ultimately be grown by private individuals before their commercial success is assured, it may be well to point out that those private experimentors who test these problematical new plants are assisting in a very practical way in the plant introduction work of the country even though they are not paid for their work.

It is often around the successful cultivation of a new introduction by some private individual that a new plant industry begins.

The new plants imported by this office of the Department of Agriculture are in most cases so little known to experimentors that their scientific or even common names alone would convey little idea of their character. To enable him at any time to refresh his memory as to the use of any one of these introductions, special celluloid tags have been devised upon which are printed sixty words of description. These descriptive tags are attached to the plants when they are sent out. The catalogue is made up of the identical descriptions which will appear upon the celluloid tags.

The information on the labels consists of the Plant Introduction (S. P. I.) number, under which the plants are known at all times, of the scientific name and a common name, when one has been adopted for this country, and a brief description of the plant with its uses, and, where possible at this time, a suggestion of the gen-

eral region to which the plant is likely to be adapted.

The Bureau of Plant Industry invites the cooperation of gardeners in testing out these foreign plant introductions, both for greenhouse and outdoor purposes, to enable the Bureau to learn of their suitability for our varied climates. It is to be supposed that some of these introductions will adopt themselves to any of our climatic conditions and some only to certain conditions, while it will be found that others cannot be grown at all successfully in this country. It is for the purpose of gaining knowledge of these plants' behavior in different sections of the country that they are being distributed among those who signify a willingness to aid in the experiments. Gardeners desiring to interest themselves in this work are requested to address: P. H. Dorsett, in charge of Plant Introductions, Bureau of Plant Industry, Department of Agriculture, Washington, D. C.

## TIMELY HINTS FOR NOVEMBER, DECEMBER AND JANUARY.

Collect egg masses of the tussock moth.

Cut out and burn all hickory trees infested with hickory bark beetle.

Begin to spray fruit trees against the attacks of all scale insects.

Cut away all twigs and branches of plum and cherry trees infested with "Black Knot."

Pick off all mummied fruit from peach and plum trees and gather all diseased fruit from the ground and burn.

Prune and remove dead wood from trees. Treat cavities before freezing weather.

Protect rhododendrons with evergreen boughs; partial shade during bright days in winter is all that is necessary against sun

scald.

Cut around the base of trees to be moved this winter and fill trench with strawy manure. This will allow you to easily move tree with a frozen ball.

Take out trees badly infested with the locust borer.

Where apple orchards are badly infested with apple scab, plow to bury the fallen leaves, the chief sources of primary infection in the spring.

For peach rust wash the trees in winter with ferrous sulphate

one-fourth, to destroy spores.

Inspect all pear trees for fire blight now and again in early spring before blossoms open and cut out and treat all cankers in main limbs and body.

Use all of the fallen leaves for a mulch for the trees. Do not burn them.

Cut out portions of willow and poplar infested with the willow and poplar borer.—Tree Talk,

### NEED FOR SHADE TREE EXPERTS.

Too little appreciation of the value of shade trees is evident in many towns and cities throughout the United States. The residents and the city officials do not realize how much more attractive their city would be if it had well-shaded streets and trees about the residences. Perhaps this is because the majority of them have never seen such streets as, for instance, those in Washington. It is a condition which may be overcome by education.

There is need for experts in shade tree conditions who are competent to fill positions for the care of a city's trees, as it will not be many years before all the progressive cities in the country will have shade tree commissions or departments having power to engage men to care for their shade trees. Provision is now being made for the apparent need of these men by several of the colleges which have already inaugurated, or are contemplating inaugurating, a department for the training of experts in shade tree work.

Several cities where the value of such trees has been appreciated have shade tree departments which not only provide for trees owned by the public, but give service for those privately owned, and in every instance where the management is competent and the appropriation sufficient to meet the needs the citizens have reason to be proud of the result.—American Forestry.

## PROPOSED JOINT EXHIBITION AT NEWPORT, R. I.

There is a good prospect of a big joint exhibition in Newport. R. I., next summer in which it is hoped that the three local horticultural organizations -- the Newport Horticultural Society, The Garden Club and the Garden Association-may participate, in conjunction with the American Sweet Pea Society and possibly the American Rose Society. At a recent meeting of the committee of the Garden Association, they expressed themselves in favor of joining with the Horticultural Society in holding a sweet pea show at the Casino, and much interest has been manifested in the project. It is proposed to offer substantial prizes for sweet peas growing in tubs. The date suggested is about July 8, 1915. Secretary Bunyard of the American Sweet Pea Society is doing all he can to further this interesting proposition and is endeavoring to induce the Rose Society to co-operate. If Mr. Bunyard's plans are backed up, Newport will have the most notable exhibition of the season. Roses should be very fine in that section at the time proposed and the Rose Society would be right in its element.—Horticulture.

## DEMANDING CONSERVATION OF THEIR TREES.

Residents of Lake Forest, Ill., stirred by the fact that the shade trees on the streets of their attractive town are not getting the proper care, recently held a mass meeting and presented to the City Council some resolutions demanding vigorous action. They mean to see that the City Council does not neglect their request and will do all they can to beautify their streets and gardens by planting appropriate trees and shrubbery and seeing that those already planted receive proper care.

The resolutions quote the fact that the care of trees and shrubbery against ravages of insects and disease is being weakened by ill-advised planting of trees not suitable for the ground and climate and asking the City Council to appoint a permanent commission to safeguard the trees of the city, this commission to be empowered to superintend such conservation and forestry work as is deemed advisable, to insist on co-operation from private owners, and if possible join with other towns in the vicinity in engaging a competent forester to oversee all advisable work.—Exchange.

### REPORT OF THE S. A. F. SCHOOL GARDEN COMMITTEE.

Within twenty years the idea of school gardening has spread from Boston to the Pacific Ocean and to the Philippine Islands under United States Control.

Twenty-two years ago at the S. A. F. convention, held in Washington, D. C., Mr. Robert Farquhar, of Boston, delivered an address recommending school gardening, from which we quote:

"I think the members of this society should make a united effort to have the claims of floriculture for children and kindred subjects recognized in all our schools. I feel sure that a large majority of the teachers would give their hearty support to wisely planned efforts in this direction. I am honored by the acquaintance of one or two teachers who have for years distributed many hundreds of plants among their little pupils and with most encouraging results."

### Vol. XVIII. NOVEMBER, 1914.

No. 7.

The fall flower shows of 1914 are now an event of the past. When general conditions are taken into consideration, as they affect the country at large, it can be said that interest in the shows, from the point of exhibits, was equal to previous years. From the point of attendance, interest seemed decidedly less favorable, especially at the more important shows. Horticulture sounds a timely warning when it states that there is something fundamentally lacking in the appeal for support and that the right keynote to tune the people up to the proper pitch, and touch a responsive chord, has yet to be sounded. It adds that the sameness of exhibits and lack of decorative effects at our shows may cause popular interest in them to wane. We can subscribe to such a sentiment as we have heard murmurs at the shows this fall that they all seem alike and if you see one you have seen them all.

The layman does not view the shows with the sense of a horticulturist, who seeks the fine points and qualities of the blooms and plants exhibited. The former is looking for display; something that will be pleasing to the eye, and he soon tires viewing long rows of blooms stuck in vases "all looking alike to him." Surprises must be innovated at flower shows as they are at other shows, if the public is to be catered to. More attention must be given to arrangement and in competition arrangement should count with the quality of the exhibits more so than it does now. It is with flower shows as it is with the playhouse -the public wants a frequent change of scene for it soon tires seeing "the same old thing," no matter how good the production may be.

The purpose of the Park Institute of New England, an account of which may be found elsewhere in these columns, are worthy of careful consideration on the part of park officials throughout the country. A chain of similar organizations all linked to the national association of the park superintendents suggests great possibilities, and the accomplishments of such territorial organizations could be made the basis of an interesting and helpful discussion at the annual convention of the national organization. There is no doubt that the demands on park officials are multiplying. It is not so long ago that recreational facilities were but a small factor in park development, but they have become a tremendous factor of park management. To-day the civic improvement propaganda, which calls for city and town beautifying, makes additional demands upon park officials in many places. Park superintendency to a very large extent must be classed as a self-acquired science, and so the related experiences of one frequently prove helpful to another, especially where new conditions constantly enter into the work. Such suggestions as are provided for by the New England Park Institute should prove helpful to those who have the opportunity to participate in them.

The cooperative spirit is now stirring among many local horticultural societies. Apropos to the cooperative movement between local organizations and the gardeners' national association, the following advice recently uttered by one of the foremost economists of our country, may, if accepted, prove helpful in what the gardeners are undertaking. Referring to commercial organizations he said, "Let us unite them in the work of creating an informed and sound public opinion. Let the work of doing that be parceled out with the genius that you who know the value of organization, of cooperation, of the subdivision of labor, in the management of your own affairs, have proved you possess. See that the wisest and ablest men of your community are placed in the executive positions of your organizations. Make of yourself such earnest and able lieutenants that the detail of organization may be complete and effective. Understand fully that this means self-sacrificing service; that it means an expenditure of time, and that it means constant, cooperative effort. Through your organizations, see to it that every mis-statement of fact, whether made in the press, or in any public utterance, is challenged. Let men understand that loose statement, that mis-statement, can no longer go carelessly on." The suggestions contained in the quoted remarks can be adopted with profit by all organizations, whether commercial or professional, and if the recommendations are strictly observed must bear fruit wherever effort is directed.

## NATIONAL ASSOCIATION OF GARDENERS

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

## ANNUAL CONVENTION NATIONAL ASSOCIATION OF GARDENERS.

Philadelphia, Pa., Wednesday and Thursday, December 9 and 10, 1914.

The Committee on Arrangements Thomas Logan, William Kleinheinz and John H. Dodds reports the following programme

for the annual convention of the association;

Wednesday Afternoon (December 9). The business meeting will be called to order promptly at 2 o'clock at Horticultural Hall, Broad and Locust streets, Philadelphia, Pa. It is requested that all members attending the convention be in their seats promptly at that hour as one of the city officials will be on hand to welcome the visitors. After the meeting's routine business is disposed of and the officers for the new year elected, the members will be addressed by several prominent horticulturists on subjects pertaining to horticulture and to gardening in general.

It was voted at the convention in New York last year that in future the ladies were to be invited to attend the conventions, so the ladies accompanying members will be welcome at the meeting.

Wednesday Evening. The banquet will be held at Horticultural Hall to which ladies and all friends of the members will be welcomed. At this writing final plans have not been completed for the banquet, but the price of the dinner tickets will be nominal. Those intending to attend the banquet will notify David Rust, Horticultural Hall, Philadelphia, Pa., at their early convenience, stating how many tickets they wish to reserve. Early application for tickets will materially aid the local committee in completing their final arrangements.

Thursday Morning (December 10). A bowling tournament will be provided for the men. There will be no team bowling; prizes will be offered for individual scores. During the bowling tournament a shuffle board contest will occur for the ladies for which

prizes will also be provided.

Thursday Afternoon. Will be reserved for visits to the various growing establishments and nurseries about Philadelphia, many of the local firms having extended invitations to the gardeners to visit their establishments. Provision will be made by some of the firms to entertain gardeners, not interested in bowling, during the forenoon of that day also.

The Hotel Walton, situated directly opposite Horticultural Hall, will be the headquarters of the association during the convention. Accommodations can be obtained at this hotel at moderate rates.

The committee invites exhibits of novelties, specimen plants and cut flowers. Same should be expressed, prepaid, to National Association of Gardeners, care of David Rust, Horticultural Hall, Broad and Locust streets, Philadelphia, Pa. The association's certificate will be awarded to meritorious exhibits.

Further particulars of the convention can be obtained by addressing the local committee at Philadelphia, or M. C. Ebel, secre-

tary, Madison, N. J.

The following new members have been added to our roll: James Duff, W. A. Furmange, W. J. Paget, D. H. Von Vottger, Frank Maybury, James H. Vanzant, Washington, D. C.; Paul J. Zalesky, Urbana, Ill.; Kenneth McLean, Bar Harbor, Me.; Valentine Maternonski, Portchester, N. Y.; Frederick W. Sparks, Gold, Ill.; David W. Slade, Menlo Park, Cal.; Eugene B. Burgle, Mare Island, Cal.; John M. Daly, Menlo Park, Cal.; R. T. Beers, Cromwell, Conn.; H. Morgan, Hartsdale, N. Y.; T. J. Morris, Irvington, N. Y.; Frank C. Tesar, Woodbine, N. J.; James P. McLennan, Lenox, Mass.; Albert E. Troke, Sharon, Pa.

## AMONG THE GARDENERS

A new orange house has just been completed at Faulkner Farm, Brookline, Mass., the estate of E. O. Brandegee. W. N. Craig, superintendent.

W. N. Craig lectured before the Gardeners' and Florists' Club of Boston on November 17 on "The Gardener and His Profession."

H. Marschke, formerly of Tarrytown, N. Y., is now in charge

of the R. M. Gillespie estate, "Forest Lodge," North Stamford, Conn.

George F. Shaw, for the past seven years superintendent of the G. W. Wickersham estate, Cedarhurst, N. Y., recently resigned his position.

Charles McCabe, formerly with Walther Luttgen, at Bethol, Conn., has accepted the position as gardener to W. E. Schall, New London, Conn.

It is reported that Mrs. George D. Widener has purchased some additional property at Newport, R. I., on which an extensive range of glass is to be constructed.

The sympathy of the gardener friends are extended to Robert Hunnick, of Newport, R. I., on his recent bereavement in the loss of his wife, Jane Carr Michael Hunnick.

W. D. Robertson, formerly superintendent of the Benjamin Stern estate, Roslyn, N. Y., has accepted the position of superintendent on the F. W. Woolworth estate, Glen Cove, N. Y.

William Kleinheinz, superintendent of the P. A. B. Widener estate, Ogontz, Pa., was re-elected president of the Chrysanthemum Society of America at its annual meeting held in Indianapolis, Ind., on November 7.

H. F. Smith, who is superintendent of the gardens of Percival Roberts, Narberth, Pa., is convalesing from a serious illness. He was moved to his own home on November 11 after a two months' stay in the hospital.

The many friends of Lester Ortiz, superintendent of the W. P. Bliss estate, Bernardsville, N. J., will be pleased to hear that his health is again much improved, and that he is now rapidly recovering from his recent serious illness.

Thomas Page, superintendent of "Brookside Gardens," Great Barrington, Mass., was the successful competitor for the Chrysanthemum Society of America's silver cup for the best twelve blooms, long stems, in foliage, at the Indianapolis show.

In the greenhouses of E. S. Webster, Chestnut Hill, Mass., William Downs, the superintendent, has a beautiful display of the bright winter blooming Begonia Mrs. Heal. The plants are in eight inch pots, and are large, bushy specimens.

Robert Fords Petric, gardener to Dr. Millspaugh, Paterson, N. J., was married on October 30, in New York, to Jeannette Wilson, daughter of Mr. and Mrs. George Wilson. The bride's father is superintendent of the R. J. Taylor estate, Jericho, L. I.

Frank MacNicoll, head gardener to F. B. Simpson, Empire City Farms, Cuba, N. Y., was married on the 7th of October to Miss Agnes Grant Johnstone at Warkworth, Ont. The bride is a native of Dundee, Scotland, where Mr. MacNicoll met her on a visit abroad two years ago.

Charles Sander, who has charge of Professor C. S. Sargent's estate, Brookline, Mass., has a wonderful display of Nerines this season. In addition to all the known named varieties he has thousands of seedlings, many of which have flowered and they include some grand sorts.

William Plumb resigned his position as Superintendent of Floriculture of the Panama-Pacific Exposition, California, on November 1 to accept a position as manager of the estate at Ingenio "Santa Gertrudis" Banaguises, Cuba, for which island he sailed the early part of the mouth.

Stephen Dombrosky has been appointed superintendent of the Benjamin Stern estate, Roslyn, N. Y., to succeed Mr. Robertson, Mr. Dombrosky was formerly superintendent to the late J. Pierpont Morgan, Highland Falls, N. Y., being succeeded by Alexander MacKenzie, the present superintendent of that estate.

William Vert, gardener to Howard Gould, "Castle Gould," Port Washington, N. Y., was successful in carrying off six firsts, one second, and one third prize at the annual show of the Chrysanthemum Society of America held in Indianapolis. These prizes were won in open classes which included competition by commercial growers. Mr. Vert must be credited with quite an achievement considering the distance that his flowers had to be transported.

Sabin Bolton, who has charge of the Heinze greenhouses, Pittsburgh, Pa., has had a grand show of chrysanthemums in his fine block of houses, some thousands of plants, embracing all types are included. The public have had the privilege of inspecting the display, and have availed themselves of it in large numbers.

We regret to report the practical closing up of the beautiful Proctor Estate, Topsfield, Mass.' All the stock in the greenhouses has been disposed of. The fruits, plants and flowers from this noted establishment have won many gold and other medals at the Boston Shows. The arboretum alone covers some three hundred acres, and is the only patch of the three thousand acre estate likely to be used for some years. James Marlborough was in charge of this fine estate. Some photographs of the rock garden appeared in the convention number of the Chronicle.

## ROYAL HORTICULTURAL SOCIETY.

The following communication has just been received by the committee appointed at the meeting of the National Association of Gardeners, held in Boston August last, to draft suitable resolutions conveying the sympathies of the organization to the European horticulturists:

Royal Horticultural Society,

Westminster, London, England.

Nov. 3, 1914.

Dear Sirs:—The council of our society are very grateful to you and to the National Association of Gardeners for the kind and brotherly sympathies which you extend to us and the other gardeners of Great Britain and elsewhere in the present time of intense strain and distress.

May we hope that when the time comes for the reinstatement of the Belgium horticulturists we may receive your active co-operation and financial support. Our society will start a fund of help when the right time comes; but that time we grieve to say is not yet.

With brotherly greetings to our fellow gardeners in

the States, I am,

Yours very truly,

W. Wilks, Sec'y. R. H. S.

By order of the President and Council of the R. H. S.

## BRITISH GARDENERS' ASSOCIATION.

London, N. W., September 29, 1914.

To the National Association of Gardeners.

The members of the British Gardeners' Association send their cordial greetings to you, in reply to the inspiring message you recently sent.

We shall be only too happy to do all in our power to help you in the co-operative movement you are inaugurating in the United States, and await your further suggestions.

At the present time our country is shaken by an unfortunate conflict of arms, but we are confident that the future for horticulture, the world over, is very bright.

We wish the N. A. G. the greatest possible success in

the work they have undertaken.

With all good wishes,

British Gardeners' Association,
CYRIL HARDING,
Gen'l Secy.

## CHAS. H. TOTTY MUCH IMPROVED.

The news of Charles H. Totty's continual improvement will be received with cheer by his many friends in horticultural circles. The latest reports received indicate that it will not be long before Mr. Totty will be able to be about again and attend to his business as usual.

Mr. Totty's illness came on him very suddenly. Ailing on Wednesday the fourth inst. he nevertheless felt able to attend the American Institute flower show in New York, on the afternoon of that day, but on Thursday he found it necessary to remain at home, suffering from what he at the time believed to be nothing more than a strain of the muscles. The pain increased and his physician was called in later on that day, and on Friday, after an examination by a specialist Mr. Totty was removed from his home in Madison, N. J., to the Overlook Hospital in Summit, where immediately after his arrival he underwent an operation which disclosed that he was suffering from appendicitis in an acute form; also, that his condition was very grave. By the following Sunday Mr. Totty commenced to show marked improvement, and hopes of his recovery were entertained. He has continually gained in health since then and is now well on the road to recovery.

Mr. Totty has been the recipient of many messages from numerous friends, wishing him a speedy and complete recovery and that his familiar face may soon be

seen again where horticulturists congregate.

## MEETING OF THE NATIONAL FLOWER SHOW COMMITTEE.

The National Flower Show Committee held a meeting in Philadelphia, November 11 and 12. It was decided to lease Convention Hall, in which to hold the Flower Show in 1916.

Considerable discussion took place regarding the premium list. A list was provided for, the total value of which will be \$15,000. Liberal apportionments to the different societies were made, the same to be contingent upon the usual conditions as to active cooperation. The premium committee was given authority to prepare a preliminary schedule on the basis thus determined, all special prizes being considered as part of the total valuation. A resolution was passed authorizing the secretary to raise a guarantee list to amount to \$10,000. The secretary was authorized to sell space for trade exhibits at the show, upon the usual basis of compensation for his services. The matter of the official programme was left in the hands of the local executive committee.

Wm. Kleinheinz spoke of the thought he had given to the show and had every confidence in its success. He did not consider Convention Hall too far from the center of the city. He promised to support the show in every way he could, and said he would exhibit on a large scale, and that every private gardener around Philade'phia would also exhibit.

John A. Dodds expressed his confidence in the success of the show, and said that he would make a large exhibit and lend his assistance in any direction required.

Thomas Logan spoke for the private growers and promised their support, also his time and assistance in an effort to make the show a success.

David Rust, secretary of the Horticultural Society of Pennsylvania, expressed his satisfaction with the proposed location of the show, and predicted a successful outcome. His society, he said, was ready to-assist, and was awaiting definite information as to arrangements before launching into the work of preparation.

Chairman Asmus thanked all present for the interest they had shown in the undertaking. The National Flower Show Committee, he said, would at once appoint the chairmen of the various committees to handle the

work of preparation for the show.

It was decided that the exact dates of the show would be announced later.

John Young, Secretary.

### AMERICAN ASSOCIATION 0F PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. S. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

### ASSOCIATION NOTES.

For the benefit of members who have joined the Association during recent years, following is the list of bulletins in pamphlet form which have been published from time to time and which

can be secured from the secretary:

No. 1, 1906 | Floral Decorations in Parks or Squares.

No. 2, 1907 - Pruning; Moving Trees; Oiled Roads; Winter Sports.

No. 3, 1907 Water Gardens: The Herbaceous Garden: Bulbs; Playground Management; Cement Concrete Construction.

No. 4, 1967 Construction of Roads, Drives and Paths: Evergreens for Parks; Fertilizers.

No. 5, 1909—Lighting; Plantations; Weed Killing; Park Signs; Surfacing Playgrounds: Gardeners; Cinder Walks, No. 6, 1910 - Street Trees; Policing.

No. 7, 1911—Organization of a Park Commission; The Duties of a Park Superintendent; Park Music; Park Statistics.

No. 8, 1912—Park Seats; Park Rules; Drinking Fountains; Garbage Collection; Parks East and West.

No. 9, 1912 - Lawn Mowers; Crosscutting on Lawns; Destruc-

tion of Lawn Weeds; Lake Weeds.

No. 11, 1914-Insects Injurious to Shade and Ornamental Trees. These pamphlets are made up of comments on the subjects mentioned and other sundry subjects by members from all different points of the country and are interesting side lights on the questions discussed. Members at the time of publication were supplied, but new members who desire copies may secure such as they desire from the sceretary without cost, simply remitting sufficient postage on the basis of two cents per pamphlet. The secretary has on hand a liberal supply of Nos. 5, 6, 7, 8 and 9 with a limited number of the others.

The secretary also has on hand a large supply of copies of the following convention proceedings which might be of service to members who have joined since: Minneapolis, 1908; Seattle, 1909; Harrisburg, 1910: Kansas City, 1911, and Denver, 1913.

These booklets contain many valuable papers and discussions, which are of real practical value. Members desiring copies of any or all of these can secure the same by simply remitting postage at two cents per copy.

The proceedings of the Newburgh-New York convention will be off the press and in the members' hands before the holidays, also the membership roster and revised by-laws.

On account of the fact that no stenographic report was made of the last convention, the new secretary had a task before him in preparing the proceedings from memory and odds and ends, and unfortunately many valuable remarks and comments brought out in discussions were not recorded and will not appear.

An error in our Bulletin No. 11 is called to our attention by C. G. Heuston, Dominion Entomologist at Ottawa, Ontario, which

should be noted by our members.

Mr. Heuston states: "In reference to the Small Ermine Moth, Hyponomeuta Padellus from Saskatoon, specimens sent in by Mr. H. H. Browne on examination proved to be the common Cherry Tree Tortrix, Archips cerasavorana Fitch. I am pleased to have this cleared up and to know there is no ground for the supposition that this serious pest has been introduced into this

Reference to this moth appears on page 17 of our Bulletin No. 11, "Insects Injurious to Shade and Ornamental Trees," and members should cancel the reference on their copies, as the secre-

tary has done in all copies on hand.

The secretary is pleased to announce that the members are responding nicely to the call for prompt payment of dues, that all of the old bills as well as the new ones have been paid and the Association does not owe a dollar and is now on a cash basis.

This is as it should be and the officers do not propose during the current year to incur indebtedness beyond the amount of the available revenue.

Mr. John Dunbar, of Rochester, who was elected to honorary membership at the Newburgh session, in a letter to the secretary acknowledges his selection, expressing his surprise and appreciation. Mr. Dunbar has requested that he be carried both as an honorary and as an active or senior member, in order that he

may pay dues and contribute to the support of the Association. This is also the case with our old friend C. M. Loring, formerly of Minneapolis but now at Riverside, Cal., who carries double membership in order to be a voting and contributing member.

The secretary would like information as to the correct address of Bernard F. Rifkin, who became a member at the Boston session in 1912 and has been carried on our roster as Superin-tendent of Parks at Reading, Pa. Another of our members, Wm. I. Hoch, is superintendent at Reading, and states that Mr. Rifkin has never been connected with the park department of Reading and is not a resident of that city. Can some member give the secretary a little light on the subject?

As a number of members of the Association who are not actively engaged in park work at present are in doubt as to the status of their membership, a statement of the substance of our laws in this regard is in order.

Our laws provide that active or senior members who have been out of official service for more than two years must notify the Association and thereafter be classified as associate members unless by special action in convention. If at a later date they return to public life they may be re-instated to senior membership upon application. Associate members, whether in or out of public service, can retain their membership indefinitely, unless dropped by action of the Association in convention.

The official membership roster of the Association is to be published shortly and the secretary is anxious that it be as nearly correct and complete as possible. If the address on the wrapper of the magazine is not complete, if your title is wrong or your name misspelled, kindly notify the secretary at once, or else do not complain if the roster is in error.

### PARK DEPARTMENT PERSONALS.

Past President W. H. Dunn, who missed the New York convention, is in business for himself at Kansas City, having resigned as superintendent of the Kansas City system. Mr. Dunn is now working on a city plan for Paris, Tex., and is consulting landscape architect for a number of small cities of the South and Middle West. He says he will sure be with us at the San Irancisco convention and may possibly be back in public park work by that time.

Henry K. Eckert, Superintendent of the State Reservation at Niagara, who was elected to membership at the Newburgh convention, writes: "I appreciate the honor conferred upon me in electing me a member of this great association and trust I may have the pleasure of meeting some of the members, if not all, at the San Francisco convention in 1915."

The thirtieth annual report of the Niagara Reservation, just issued, contains a history of the reservation and is a most interesting document. Mr. Eckert will be glad to forward a copy of

this book to any of our members who desire it.

L. P. Jenson, landscape architect at Busch Place, St. Louis, writes his regrets at having missed the New York convention, as it is the first one he has missed in five years. Mr. Jenson has been busy on some extensive concrete road construction and later on will submit an article on this subject with pictures showing the work he has been doing. He will also later contribute for these columns an article on "The Value of Native Birds in Parks," which should prove interesting.

R. C. Driver, for sixteen years past secretary and superintendent of the Lynchburg (Va.) Park and Forestry Commission, has decided to try and locate in some larger city where his wide range of experience can be put to better use. Mr. Driver will sever his connection with the Lynchburg department on January

Ralph R. Benedict, formerly construction engineer at Kansas City, who will be remembered by those who were at the Kansas City convention as the active young man who attended to so many details of entertainment, is now filling the shoes of Mr. Dunn under the title of Assistant Executive Officer. Mr. Geo. E. Kessler as landscape architect is still with the department, but otherwise the commission and executive force at Kansas City

has completely changed since our most successful convention in that city in 1911.

Andrew Balmer, for several years Superintendent of the Vancouver (B. C.) Parks, but disengaged for some time, has, through the agency of the secretary's office, been assigned as landscape gardener at the Washington State Reformatory. Members who attended the Boston convention will probably remember Mr. Balmer's collection of photographs which he displayed, showing the big trees of Stanley Park in Vancouver.

Frank C. Hargett, of Frederick, Md., who has been doing excellent work in the operation of educational gardens in his native city, desires to broaden his field of usefulness and is anxious to become assistant superintendent of the park system of some metropolitan city. Mr. Hargett has made a splendid record at Frederick and is vouched for by F. L. Mulford, of the U. S. Department of Agriculture, and Geo. W. Hess, of the U. S. Botanic Gardens at Washington, D. C.

Laurie D. Cox, landscape engineer for the Los Angeles park department for many years, has severed his connection with that department. Mr. Cox is a Bostonian and attended the recent Newburgh convention, but at that time did not make known his change of plans. Without definite information on the subject, we are of the opinion that Mr. Cox expects to go into business for himself.

## W. H. COLDWELL PRESENTED WITH LOVING CUP.

Without an inkling of what was to occur, William H. Coldwell was recently surprised at his camp, "For-get-it," on Stormville Mountain, opposite Newburgh, N. Y., by the appearance of President Gustave X. Amrhyn, James B. Shea and William J. Zartman, a committee of the American Association of Park Superintendents, accompanied by Mayor John B. Corwin, Park Commissioner William Cook Belknap and E. C. Ross, of Newburgh. Earlier in the month Mr. Coldwell had been asked to entertain a few guests for the week end at his camp and to designate a convenient time to have his friends visit him.

LOVING CUP PRESENTED TO WM. H. COLDWELL BY HIS FRIENDS IN THE AMERICAN ASSOCIATION.OF PARK SUPERINTENDENTS.

As the party was assembled in the evening at the conclusion of dinner, Mr. Shea "sprang the surprise," when, with well chosen words, he presented Mr. Coldwell with a handsome loving cup, the gift of his many friends in the American Association of Park Superintendents, in commemoration of their cordial reception at Newburgh last August, and in appreciation of the indefatigable services Mr. Coldwell rendered in connection with the 1914 convention. Mr. Shea was followed by the other mem-

bers of the committee, who joined in thanking Mr. Coldwell, and the officials of the city of Newburgh, for the genial hospitality that the association met with during its stay in their city; to which Mr. Coldwell and the others present responded fittingly.

WILLIAM H. COLDWELL.

William H. Coldwell, who numbers his friends in every city from the Atlantic to the Pacific, was born in Newburgh in the year 1863. Graduating from the public schools of that city, he entered the machine shops of the Coldwell Lawn Mower Company and began his education in lawn mower building at the very bottom and gradually worked his way up. When he gained the knowledge of the construction of lawn mowers he engaged in the selling end of the business and for some years represented the company on the road, during which time he accumulated a host of friends throughout the country. On the death of his father some eight years ago Mr. Coldwell became president and general manager of the Coldwell Lawn Mower Company, which office he occupies today.

It is said that the hobby, outside of directing the affairs of his company, from which Mr. Coldwell derives most pleasure is the gardens which surround his home. He there seeks much of his recreation and enjoys working among the many rare plants and flowers that are planted in his home grounds.

## PARK INSTITUTE OF NEW ENGLAND.

Nineteen park men from eleven cities in New England met on October 22 at Hartford, Conn., to organize for the study and discussion of park and play ground problems. The purpose of the organization, which is named Park Institute of New England, is set forth in the following resolution presented by George A. Parker, Superintendent of Parks of the city of Hartford, which was adopted by the meeting:

We, citizens of the different cities of New England, interested in municipal parks and playgrounds, and desirous of making available to each of us and to the public such knowledge and experience, arising from the methods and management of parks and playgrounds by cities, in order that they may give increased opportunity for the growth and development of children and young people, and and to the comfort and happiness of grown ups, do agree to form ourselves into a Park Institute from New England, and to abide by the following conditions:

1. One member shall have entire charge of the affairs of the Institute, to be known as its manager, who may make assessments as needed, arrange for meetings, and do whatsoever work as in his judgment is necessary. He is to serve without compensation, and

for one year or until his successor is chosen, to be elected at the first meeting held after the first of January each year.

2. There may be six meetings each year, to consist of addresses, papers, theses and discussions which may be typewritten and sent to each member as requested,

3. Candidates for membership may be proposed by any member, the vote being taken by letter, three negatives to reject. Each member at the first meeting to prepare a thesis upon some subject

4. Each member agrees to prepare papers and addresses on any topic that may be assigned him by the manager, or to lead or take part in the discussion, to serve on committees of investigation or other matters as the manager may direct.

5. The manager may drop from the role those members who

fail to attend three consecutive meetings.

6. As the purpose of these gatherings is for the serious consideration and formulation of the work and service of parks and playgrounds, all social affairs and banquets are to be discouraged and not to prevail until after the meetings for the presentation of subjects and their discussion have adjourned.

G. H. Hollister, superintendent of Keney Park, Hart-

ford, Conn., was elected to be the first manager of the

At the meeting the subject of winter recreations was discussed. Charles P. Lass, Superintendent of Parks, Springfield, Mass., submitted a report of what that city has done in the way of municipal dancing in one of its playgrounds and what it hoped to accomplish this winter.

H. W. Hearle, now also of Springfield, Mass., gave a talk on "Tree Walks or Talks." A. V. Parker, Superintendent of Parks, Worcester, Mass., and W. E. Fisher, of Franklin Park, Boston, Mass., discussed their experiences with toboggan slides and tobogganing. All of the subjects were generally discussed by the others

The next meeting of the Institute will be held about the middle of December, although the exact date and place have not yet been fully decided on

## Public Parks Recreation System of Minneapolis

By F. C. BERRY, SUPERVISOR.

The Playground and Recreation system of Minneapolis is being developed by both the School and Park Boards.

The School Board is aiming to establish playgrounds in the school yards which are especially adapted to the use of small children.

The Park Board is undertaking the task of so equipping certain park areas as to provide for public recreation in its broadest sense.

The influence of the playground movement was first felt in Minneapolis some nine years ago. Since then the

growth has been gradual and steady.

A study of the evolution of recreation facilities in their relation to public parks will show a logical division of four groups of interests which require a varied equipment and management, as outlined by Edward B. De Grout, General Secretary, Playground Association of Chicago.

"Group one.—Seasonable sports; skating, tobogganing, hockey, ice boating, rowing, sailing, canoeing, bathing and

"Group two.—Traditional games; baseball, rugby foot-

ball, soccer football, golf, tennis, etc.

"Group three.—Traditional track and field athletics; running track, high jump, pole vault, broad jump, shot put, discus, hurdle racing, etc.

"Group four.—The modern supervised playground; gymnastic and play apparatus, sand boxes, wading pools, modified baseball, basket-ball, volley-ball, hand-ball, quoits, swimming pools, field houses containing halls, club rooms, gymnasiums, bathing and dressing quarters."

This article will deal with the Park Recreation System

of Minneapolis under the foregoing grouping.

## SEASONABLE SPORTS.

The city finds itself especially favored by nature in a liberal distribution of small lakes within the city limits. From the standpoint of water sports, these lakes are invaluable. Numerous sailboats are made continuous use of during the breezy summer days. Storage racks and lockers at points conveniently distributed along the shores of the park lakes are erected each year for the great army of canoeists who are thus provided with all facilities for canoe care. 1,506 privately owned canoes furnished recreation for thousands during the past summer. At Lake Calhoun and Lake Harriet are Boat Houses where boats or canoes may be rented. Three launches make regular trips; two of them running on Lake Harriet and the other on Lake Calhoun, Lake of the Isles and Cedar Lake which are all connected.

Four bath houses, three of which are located on lakes and one composed of two concrete pools through which flows a small stream, are open from June 1 to September 15. During the sultry days of summer the capacity of these baths is taxed to the utmost.

The Calhoun bath house, situated on the north shore of Lake Calhoun was completed in 1912. The building is of monolithic concrete construction, dry mixture. The dressers are built of steel frames, expanded metal and plaster and the lockers are of steel and standard size.

The beach, which is 1,200 feet long and 200 feet wide, is built from sand pumped out of the lake.

The building contains:

1. The men's department with 1,036 lockers.

2. The women's "
3. The boys' "
4. The children's " 294 356

84

The first three have shower baths and inside toilet accommodations. Well arranged suit rooms are provided for each of the three departments where bathing supplies may be obtained by the bathers as they enter the walled courts containing the dresses and lockers. The courts are open overhead being directly exposed to the sun which is an extremely valuable sanitary feature. A cashier's office, a refreshment counter and a well equipped emergency hospital room complete the equipment. The basement contains a heating plant and a pump and compression tank delivering drinking water from a deep artesian well to seven drinking fountains distributed through the building and the terraces.

All accommodations are free except that a nominal

charge is made for bathing supplies.

Life guards are on duty on the beach at all times and safety ropes are placed at depths of three, and four and one-half feet.

Diving platforms and towers are erected outside the safety ropes at depths of from seven to twelve feet. These are furnished with spring boards.

The diving facilities have proven very popular.

The bath house and beach fills a long-felt need, as was demonstrated by the instant popularity with which it was received by the people of the whole city. Interest in swimming quickly increased and was especially noticeable on the part of the girls and women. The total cost of the Calhoun Baths, including the construction of the beach, was \$82,000.

The other lake bath houses, though less pretentious and well equipped, offer excellent bathing facilities and are patronized to their capacity.

About fifteen thousand bathers can be accommodated on one day at all the bath houses. The total bath attendance for 1913 was 291,161, and for 1914, 320,726.

The picnic grounds at Lake Harriet and Minnehaha Falls provide picnic accommodations. These grounds are also equipped with play apparatus for small children.

During the winter season twenty-six electric lighted skating rinks are provided on the lakes and in the neighborhood parks throughout the city.

Warming houses, some of a temporary nature, furnish comfort and checking privileges for the skaters.

A double toboggan slide, constructed of two wooden chutes on a trestle, extending from a high bank out over the surface of Lake Harriet, was built a year ago. Electric lights make the slide a popular evening attraction.

A long slide for bob-sleds is kept iced in Powderhorn Park, as well as a steep incline, suitable for toboggans, in

Columbia Park.

Skiing is a favorite pastime for many of Scandinavian descent. The hills of Glenwood Park offer excellent inducements for this vigorous sport.

Ice hockey is a favorite winter game, especially for boys and young men. Nine hockey rinks are constructed and maintained throughout the skating season. Some of these rinks are lighted so that evening play is possible.

The Department of Playgrounds conducts an amateur hockey league of eight teams. The games are played in the evening by artificial light.

### TRADITIONAL GAMES.

Baseball is the leading summer game. The parks now contain twelve fully equipped baseball diamonds which amateur teams may play on at any time by securing a permit and conducting themselves in accordance with the regulations governing conduct and play.

During the autumn season these same fields are made suitable for football by erecting goal posts and marking with lime. Permits are issued as for baseball, and the games are controlled by park police supervision.

Soccer football is played by all the grade school teams and by an amateur league made up for the most part of players who learned the game on the "other side."

The university has also taken up the game. Soccer can hardly be said to have become generally popular here as yet, although each year sees increased interest.

Tentative plans have been made for a public golf course in Glenwood Park, but as yet nothing definite has been done.

In natural advantages this park offers an excellent tract for golf, and is only two miles distant from the central business district.

Tennis courts are provided to the number of thirtythree. More than half of these are clay courts, with backstops, and are open to the public at all times, subject to certain regulations.

Tennis has taken its place as a most popular form of recreation for the business man. Women and girls are also ardent devotees. Requests for additional courts are constantly being presented to the board. I believe that in the near future it will be necessary to light the courts and make play after dark practical.

## TRACK AND FIELD ATHLETICS.

Interest in this branch of sport cannot be said to be very great. Some emphasis is laid on competition in athletics during the summer season, under the direction of playground instructors. Inter-park track and field meets are held in which large numbers of boys and girls compete, but the interest is not sustained enough to result in regular practice. Equipment in the form of jumping pits and rings for discus throwing and shot putting has been placed in most of the larger playgrounds. At present, however, there are no large athletic fields containing a quarter-mile running track and standard equipment for track and field athletics.

A plan for a large stadium of such a character has been prepared by Superintendent Wirth, but owing to a lack of funds, nothing further has been accomplished.

## NEIGHBORHOOD PLAYGROUNDS.

During the past season the most efficient development in supervised play and organized activities thus far was reached.

Nine playgrounds, containing a more or less complete equipment of gymnastic and play apparatus, sand boxes, swings, see-saws, merry-go-rounds, slides, basket ball, volley ball and modified baseball, were supervised by a corps of nineteen playground instructors during a period of two and one-half months.

On six of these grounds the hours of supervision were from 1.30 to 5.00 p. m. and from 6.30 to 9.00 p. m.

The other three grounds had additional supervision. The work consisted of instruction in athletics, gymnastics, group games, basket ball, volley ball, baseball, aquatics, tennis, soccer, singing games, folk dances, sewing and story telling.

For purposes of competition the boys were divided according to height into three grades. Each playground was represented by a team in baseball, basket ball, volley ball, track athletics and gymnastics in each of the three grades and competed with the teams of the other playgrounds for the championship. The girls competed in the same way in basket ball and volley ball.

Meets were held in athletics, gymnastics and swimming in which teams from all the playgrounds entered.

A league of eight church teams was organized in conjunction with the work at the North Commons Playground. A similar league made up of teams from the railroad shops was formed at the Longfellow Field Playground. These leagues brought a large number of individuals into an active form of recreation.

A final Park Playground Festival was held August 14 in the National Guard Armory in which about six hundred children took part in an exhibition of all the

phases of playground activities.

The policy of the supervisor has been to carry on the activities in such a manner that large numbers of boys and girls may become interested and take part in some form of out-door recreation. With this end in view competition is devised which emphasises the team or large group as a unit and not the individual.

At present Logan Park is the only park having a field house containing an assembly hall, committee rooms, shower baths and dressing quarters. This building is made good use of by the neighborhood for meetings and entertainments of a varied character. Dancing is allowed

on two evenings of each week.

Exclusive of tennis courts, baseball and football fields, the park system now provides seventeen playgrounds, nine of which are well equipped for standard supervised play activities. Several new unimproved sites have recently been secured in thickly populated districts where playgrounds are especially needed. The improvement of these sites and the acquisition and development of more grounds will soon serve to bring the advantages for recreation into closer touch with a large proportion of the population.

(Continued from page 251.)

The economic value of this work, as is realized today, is of much importance in every town where it takes root. The value of a taste cultivated in the direction of making things grow in a small way tends at once to improve the appearance of a neighborhood. The florists' shop never causes a detriment to a neighborhood, but is the example of what will make the homes of a community look better.

The past year the Committee on School Gardens has followed up its limited work of suggestion to school trustees and others in every city, town or village where a member of the Society of American Florists is located, by mailing to each official school body a well illustrated circular letter, calling attention to this work, and appreciation of this call is acknowledged by many.

One of the manufacturing towns which were built on the sand dunes or waste places at the south side of Lake Michigan is Gary, and the leading men of the cosmopolitan city of New York have been out there and came back home to tell among other things what school gardening and flower growing do to break up the old time barrenness of a manufacturing city. This work over the country, especially in the larger cities, like Cincinnati, St. Louis, Cleveland, Chicago, Los Angeles, Bellingham, Worcester, Toronto, Baltimore, Pittsburgh, Buffalo, Syracuse, Minneapolis, Atlanta, Louisville, Indianapolis, Grand Rapids, Kalamazoo and so on, gives merely an idea of what is being done in central centers of large population. The work is aided by the seedsmen in many places. Roses, Dahlias, Asters, Gladioli, Cannas, Colcus, Geraniums, Sweet Peas, etc., are an evidence of the increasing appreciation by the mass of American families of flowering plants in the odd corners and waste places. Example and training are effective ways which lead and elevate home taste. A development in the use and growth of flowers is nowhere more apparent than the roofs of the great tenement buildings or apartment houses on Manhattan Island the boxes of flowers tell their own story of the yearning in human hearts for pretty things, and the florists and seedsmen of the world are the trades that help uplift humanity.

Your Committee's advice to all the people is-keep right on

the job.

New Zealand.

Respectfully, BENJAMIN HAMMOND, MICHAEL BARKER, IRWIN BERTERMANN, GUST. X. AMRHYN, LEONARD BARRON.

## PRIZES OFFERED FOR PHOTOS. OF LARGEST TREES.

Foresters of the United States are interested in the announcement recently made by the American Genetic Association that two prizes of \$100 each have been offered for two photographs ore of the largest tree of a nut-bearing variety in the United States, and one of the largest broad-leaf tree which does not bear edible seeds. In the first class, for example, are included trees such as chestnut, oak, walnut, butternut, and pecan; and in the second, trees such as elm, birch, maple, cottonwood, and No photographs of cone-bearing trees are wanted, tulip poplar. since it is definitely known that the California bigtrees have no rivals among conifers. At a later time the association may take up the same question as between the various kinds of conifers, as pines, spruces, firs, cedars, and cypresses.

The purpose of the competition, as stated by the association. is to find out in what regions the native trees attain their largest growth, and under what conditions they thrive best. these large trees are located and the measurements authenticated, the association hopes that it may be possible to secure seeds, cuttings, or grafting wood from thrifty trees in the region where they grow, to see whether finer specimens may be propagated in other parts of the country. It is hoped in this manner to get some particularly choice strains of native trees established in

regions where good specimens are not now found.

It is assumed by the association that seed from the region where the largest trees grow ought to produce larger and stronger trees than from regions where only small trees are found. By finding out where the large trees are and then planting seeds from them in other locations, the association hopes to demonstrate the practical value to horticulture and forestry of the laws of heredity. Now that reforestation is becoming a pressing problem, the question of seed trees which will produce particularly good offspring is naturally coming to the fore.

Other influences, of course, will have a bearing on the subject. and the results of the investigation may help to settle the question as to whether trees can be acclimatized. Even if they cannot be, there may be eases where trees in a new environment may make better growth than the best in their native range. This is said to be true of certain of the Australian eucalypts, and of the Monterey pine which does not amount to much in its native location in California but has proved of great value in

The federal forest service has conducted some studies along this line and has discovered, for example, that the Douglas fir of the Rocky Mountains and the Douglas fir of the Pacific Coast, while the same species, have different characteristics and will produce trees like the parent stock, modified somewhat, however, by environment. For example, if the two forms are planted together, during the earlier period of its life at least the Pacific Coast form will make a larger and stronger growth than the Rocky Mountain tree, provided it is not affected by adverse local conditions.

Several other questions, such as the climatic requirements of trees grown in different localities, will, of course, enter into the final solution of the problem. It has been found in Germany, for example, that the Pacific Coast form of Douglas fir is not as hardy as the Rocky Mountain form, which has to endure in its native habitat severe extremes of temperature, and German foresters have been working to discover a strain of Douglas fir which will combine, as far as possible, the hardiness of the Rocky Mountain form and the large size of the Pacific Coast form.

Some authorities go so far as to say that even the ingenuity and perseverance of man are unable to induce trees to change their habits far enough to adopt a country not closely like their

native habitat.

This fastidiousness in the habits of trees has its good and its bad sides, they say. It absolutely limits the forester's choice of trees to grow in a given region. But, on the other hand, there is practical certainty of results. If beech or spruce thrives where the average warmth and moisture of the growing season from year to year ranges between certain degrees, then wherever else the same average is found, in the northern hemisphere at least, the forester may plant beech or spruce, whether or not they are already there, with confidence that they will flourish.

The announced purpose of the Genetic Association is to bring about the dissemination of seed or stock of the best specimens, when found, to demonstrate, if possible, the value of heredity in tree growing. The contest for the \$100 photographs is announced to end on July 1, 1915, on which date, says the secretary of the Genetic Association in Washington, the offer will terminate.

### ARRANGEMENT OF NATIONAL ROSE GARDEN.

There seems to have been a misinterpretation in some quarters concerning the planting list of the Washington Rose Garden as included in the committee report read by Mr. William F. Gude at the meeting in Boston of the Society of American Florists. The lists were simply to show where the plants were located and were prepared for the information of donors and the use of

interested parties visiting the garden.

The arrangement of beds, as "yellow tea," "pink tea," etc., was tentative, but promises to work satisfactorily. The assignment to the beds was made entirely from catalog description. This was taken from the donors' catalogs where practicable, and where not, from catalogs of other reliable firms. The breaks in the beds were caused by the inability of some firms to supply all the plants they had expected to send. The varieties with what might be called "mongrel descriptions" were distributed with the color to which they were most nearly akin as far as description would suggest and space permit.

Places were only provided for teas, hybrid perpetuals and climbers, and other sorts were placed just wherever there happened to be room, as, for example, Dwarf Polyanthus, which are planted at several different points. It is intended to transplant varieties as soon as practicable after it is found they are not

properly placed in the scheme adopted.

The list must not be taken as a recommendation by the Department of Agriculture either as to adaptability or color, but merely as a record of where the different varieties are growing. The Rese Garden has not yet been under way six months, so, if course, the studies have hardly begun. It will require several observations before any conclusions can Suggestions are at all times most welcome, as it is desired to arrange the garden so as to be as instructive as possible.
F. L. MULFORD,

Landscape Gardener, U. S. Department of Agriculture. October 7, 1914.

## THE ART OF NAMING PLANTS.

Taxonomy has its place. It trains the perceptive faculties, teaches orderliness, develops judgment and strengthens reason. There is a saving grace in botany not found in most of the other sciences, and this is exercised through taxonomy more fully than through all the other divisions of botany combined.

Systematic botany furnishes to the average layman a more continuous incentive for pleasurable and inspiring contact with the

world about him it in any other sulped place in a cultural course. It may be the primitive phase, but most great botanists, at least, began at this point, thus illustrating

in their development the recapitulation theory. Systematists were never so numerous nor more active than at present, but all activity is not necssarily progress. Motion up and down may be spectacular and nothing more.

There is but one reason for the existence of the professional systematist, viz.: to make it easier for others to know plants. If we fail in this one thing we fail in all. Judging by the indifference of the multitude to our work; by the helplessness of the amateur who tries to acquaint himself with the plants he meets; by the none-too-well concealed cynicism of our colleagues in other lines, we are failing in this. Our work has been analytic and not constructive. We have dismembered organisms and held up to view their component parts. We have been looking for differences and with such amazing success that the fundamental resemblances have, for the most part, escaped our notice.

Morphology, physiology, ecology, and economic botany in its scores of applications have all gone forward by leaps and bounds, but in spite of, not by the aid of, taxonomy. Not all taxonomic work has been useless or erroneous. Keenness of observation and great powers of discrimination are not lacking. It is not so much that what has been done should not have been done, but rather that more should have been done to relate recent work to that which has gone before. Synthesis should have followed so closely upon analvsis of the elements of our flora that duplications would promptly have been discovered and the relations of each element to the other detected and stated.

We are on the eve of a new era of reconstruction. Already the pendulum is swinging back toward greater conservatism. The dismemberment of genera and the multiplication of species proceeds more cautiously. This grows out of the revitalized aim, "make it easier for others to know plants."—American Botanist.

### HORTICULTURAL FEATURES AT PANAMA-PACIFIC EXPO-SITION

Into the 65 acres of living gardens surrounding the Palace of Horticulture were set this month the enormous number of over 700,000 golden-flowered plants under the direction of Donald McI aren, the famous California gardener. These flowers will occupy sunken gardens in the main entrance facing the Tower of Jewels and in the Minor Courts of Palms and Flowers.

Mr. McLaren announces that work has begun on the final transplanting of 27,000 yellow wall-flowers, and an equal number of Spanish golden iris in the Court of Palms, which looks out upon the Palace of Horticulture. The Tower Plaza has already been planted with 200,000 yellow pansies, 100,000 yellow daffodils and 100,000 golden poppies. In the Court of Flowers, which opens toward Festival Hall, 250,000 golden poppies, 100,000 daffodils and 50,000 golden tulips will be set this week.

So that the 65 acres of flowers and plants will be kept constantly in bloom during the ten months of the Exposition, it is planned to replace this first setting with other flowers when the first cycle has lived its life. Mr. McLaren believes that three plantings will be required to keep the vast gardens in bloom. An unusual decision was made by Mr. McLaren this week to plant no palms in the Court of Palms, the space being given over to acacias, towering Italian cypresses and low-growing eugenias. The balustrade surrounding the pool will be overhung by low trailing muchlenbeckia, or maiden-hair vines.

The Exposition's horticultural gardens became international in scope this week when entries of roses from Belgium and Holland were planted in the rose gardens. These flowers are government exhibits of these two countries and are entered in the competitions, one of which has a prize of \$1,000 for a new, unnamed rose.

## A NEW BOOK ON SWEET PEA CULTURE.

In his book "Sweet Peas for Profit," J. Harrison Dick, the author, covers about every important phase which enters into the culture of that popular flower. While his treatise leans more to the growing methods for market purposes, there is, however, much contained in the book of useful knowledge to the private grower. Its chapters are devoted to the class of houses and heating facilities best adopted for the culture of the sweet pea; outdoor culture; pests and diseases; description of old and new varieties and an interesting history of the winter flowering sweet pea. The book contains many excellent illustrations. It is published by the De La Mare Printing & Publishing Company, of New York; price, \$1.50.

### DEPARTMENT OF AGRICULTURE'S CHRYSANTHEMUM EXHIBIT.

The annual chrysanthemum exhibit of the Department of Agriculture, held in the departmental greenhouses, Washington, D. C., which opened on October 29, proved to be as successful as previous exhibitions.

Some eighteen hundred plants were on exhibition, representing

more than one hundred and fifty varieties of the double chrysanthemums and one hundred and seventy varieties of the single flowers and pompoms. Although the season has not been a good one for chrysanthemums, the flowers as a whole were found to be of excellent quality and several new seedlings were shown; also some varieties which have not been seen in Washington before. It is estimated that more than twenty-five thousand people visited the gardens and greenhouses during the week of the show.

### ABSORPTION OF SALTS BY PLANTS.

Plants absorb a much greater amount of water than they ever use in building up their parts. In some cases the amount used seems almost incredible. The common mustard is said to use 900 pounds of water for each pound of dry matter the plant contains. It is well known, of course, that there is a constant influx of water at the roots and as regular an outflow from the leaves in the form of water vapor. This current of water through the plant is called the transpiration stream. This stream was formerly thought to be of service to the plant by bringing in the mineral salts used, but some investigations made by Heinrich Hasselbring has shown that the amount of mineral matter (ash) in a plant in no way depends on the amount of the transpiration stream. The transpiration from two sets of plants of the same species, one in sun and the other in shade, was measured and, though the plants in the sun gave off the more moisture, the set in the shade was found to contain the more ash. This seems to show that the absorption of mineral by plants does not depend upon the amount of water absorbed. Probably a large part of the water taken in is simply used in keeping the plant cool, just as our perspiration regulates the heat of our own bodies.-Exchange,

## **OUERIES and ANSWERS**

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.

Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

"The article in the September 'Chronicle' Aquatic Gardening interested me, but why, may I ask, do we find so little aquatic planting on the country estates? Is it because gardeners in general are not familiar with them? My gardener frankly confesses that he does not understand their method of growing and that it is the work of a specialist. Can you recommend any practical books on the subject from which he can secure some knowledge on growing them?"-Estate Owner, Conn.

Replying to the above query, would say there are several reasons why there is so little aquatic gardening to be met with on country estates. Few landscape architects advocate it. Why? The employer has to be consulted in most instances on matters concerning his estate, and it is the bounded duty of the superintendent or gardener to carry out his orders, against his likes or dislikes. employer may object to having artificial ponds on the grounds on account of stagnant water and the mosquito nuisance, and the same where natural ponds exist; something has to be done to rid the place of mosquitoes, and if the gardener cannot convince him that they can be kept clear of, without the application of crude oil, the authorities will apply the oil, which, of course, rids the ponds of mosquito larva, as well as the fish and other insects and any plant life as well. Such action shows a lack of knowledge of plant and insect life.

There is another mistaken idea, and that is that water lilies require running water, whereas they require still water; still water is not necessarily stagnant; water with growing plants in it is oxygenized and kept clean and pure, even as trees, with the foliage, oxygenize the air we breathe.

If an employer expresses himself in favor of having water lilies grown, and his gardener hesitates, or says it requires a specialist, that man ought to be fired, such a one is not entitled to membership in the National Association of Gardeners; he may not be familiar with water lilies, or knows next to nothing of their culture, but there are as many volumes on water lilies, their culture, etc., as there are on many other subjects, as well as men ready and willing to give them the benefit of their experience. No gardener worthy of the name but would jump at the opportunity to specialize on any new plant, flower, fruit or vegetable his employer would delight in, especially when every facility is afforded to secure the de-

As to literature, there are such books as Making a Water Garden, by William Tricker; Water Lilies and How to Grow Them, by Dr. H. S. Conrad; water gardening, Nymphaea and aquatic plants are extensively treated on in Bailey's Cyclopedia of American Horticulture; also Dr. Henry S. Conrad's Thesis on the Water Lilies, the most complete work of its kind, besides many horticultural books on magazines without number.

Often the employer looks to his gardener for suggestions on new plants, trees, etc., and it behooves the gardener to be well posted on every subject and at an opportune moment to advocate certain plants. As to the simplicity of growing water lilies, nothing is so simple or easy. Yes, you say, when you know how; and you can know how if a little judgment is exercised.

Their chief needs are, water, still, not running; a rich soil, they are heavy feeders; a good rose soil will answer; sunlight and W. TRICKER. plenty of air if grown indoors.

"Can any of your readers recommend a successful remedy for ridding a badly infested house of the cattleya fly? I have tried spraying and fumigating and even cutting the fly out of the leaf, but I do not seem to be able to get the better of it. Is hydrocyanic-acid gas safe to use in an orchid house, and would this be effective?"-L. M., Missouri.

It is futile to cut the leads off the Cattleya, because a strong plant will outgrow the punctures caused by the Cattleya Fly which does so much harm in many orchid houses. Try and keep your plants strong by an even night temperature. The general run of Cattleya succeed finely in a night temperature of 55 degrees. Sprinkle a mixture of soot and lime around and under the benches every two weeks. The fly will show itself more in a dry hot atmosphere; therefore try to entice it out as it must be got out of the plant's growth to be killed. Close the house down tight and do not damp during the day. Make the pipes very hot and famigate with a strong dose of nicotine liquid, not paper, on sever successive nights, spraying the plants over once the next morning. This treatment will bring out the fly and effectively destroy it if perseverance is practiced.

W. ROBERT FOWKES, Madison, New Jersey.

"I would like to get some information on the cultivating of the blueberry, which I understand is finely grown on some of the estates in Massachusetts. They grow to perfection in our section in the wild state, but we do not seem to succeed in cultivating them successfully. Any information you can give me regarding their culture will be appreciated."-U. M., Nova Scotia.

## OF INTEREST TO ALL

## WM. E. TRICKER SETTLES IN WEST.

Wm. E. Tricker, for the past six years superintendent for the C. H. Totty establishment of Madison, N. J., recently resigned his position there to accept the position, as manager of the Vaughans establishment at Western Springs, Ill., for which place he departed from the East on November 1. Mr. Tricker was popularly known both among the commercial and private growers in the East. He carries with him their wishes for success in his new field. Mr. Tricker has had a varied and widespread experience in horticulture. He came to Madison, N. J., from England, where he was superintendent for Dr. Whiteley, Ltd., Uxbridge; previously as foreman for Thos. Rochford, of Turnford Hall, Chestnut, and Jas. Veitch & Sons, Chelsea, London. His earlier experience was gained, however, in the United States, being one of

the J. N. May and Pitcher & Mauder employees. He is a son of Dr. Tricker, the Water Lily specialist of Arlington, New Jersey. We feel sure that the Middle West has gained and we have lost, a man of excellent qualifica-

## PHILLIP J. COX CHANGES POSITION.

We have just learned that Phillip J. Cox, who for the last four years has been happily employed as sales representative for the Pierson U-Bar Company, has severed his connection with this concern and accepted a position as manager of Hitchings & Company's New York office.

Mr. F. W. Armitage, general sales manager for the company, being relieved by Mr. Cox of the direct care of this office, we understand will now divide his time between their various branch offices, in general sales and promotion work.

## ORCHIDS

We are Specialists in Orchids, we collect, grow, Import, export and sell orchids exclusively. If you are in the market for Orchids we solicit your inquiries and orders. Catalogues and special lists on application.

## **GARDENERS DIARY**

American Carnation Society. Annual show, Buffalo, N. Y., January 15.

International Flower Show, New York, March 17-23, 1915.

### NEW YORK SHOWS.

The annual fall exhibition of the Horticultural Society of New York opened on Friday, October 30, and continued to Tuesday, November 3. As is customary, on the evening of the opening day, the members of the society visited the exhibition, and this brought out a large attendance or many of New York's well-known people. While the display of flowers was not as large as it has been at some of the previous fall shows, the quality of the exhibition, however, was of the usual high standard.

The judges were F. Heeremans, Lenox, Mass.; George Farlsham, Lenox, Mass.; Robert Cameron, Cambridge, Mass.; John H. Gratorex, Newport, R. I.; Robert E. Tyson, N. J.; Thomas Murray, Tuxedo Convent. Park, N. Y.

The prize winners were as follows:

The prize winners were as follows:

Chrysanthemum Plants. Specimen bushes in not less than 14 inch pots. Yellow 1st, Adolph Lewisohn, Ardsley, N. Y. (gard, John Panning), with variety R. F. Felton. White 1st, Adolph Lewisohn, Ardsley, N. Y., with variety Lady Lydia. Pink 1st, Adolph Lewisohn, with variety Wells' Late Pink. Any other color 1st, Adolph Lewisohn, with variety Greystone. Sweepstakes for finest and best bush plant. Society's silver cup, valued at \$100—1st, Adolph Lewisohn, with Wells' Late Pink. In not more than 14 inch pots—Yellow —2nd, Greentree Greenhouses, Manhasset, N. Y. (gard, L. G. Forbes). Specimen odd shape, not less than 4 feet in diameter, in not less than 14 inch pot. Any color 1st, Adolph Lewisohn, with variety Lady Lydia, grown in fan shape.

Shade 1st, James A. Macdonald, Flusting, N. Y. (gard., R. Hughes), with a seedling. Eighteen scarlet 1st, Miss C. A. Bliss, with Reacon; 2nd, Daniel G. Reid, Eighteen crimson—1st, Daniel G. Reid, Irvington, N. Y. (supt., Arthur W. Golding); 2nd, Miss C. A. Bliss, Eighteen White ground, variegated—1st, Miss C. A. Bliss, with Benora—Swepstake—1or linest vase, bronze medal. Daniel Reid.—Specimen Begonia Gloire de Lorraine—1st, Sidney M. and Austin Colgate, Orange, N. J. (gard., William Reid). Specimen Cibotium Schiedel—1st, Henry W. Boettger Estate, Riverdale, N. Y. Specimen Davallia Fijlensis—1st, Mrs. J. B. Trevor, Yonkers, N. Y.; 2nd, Winthrop Surgent, Beacon, N. Y. (gard., F. E. Witney).

Winthrop Sargent, Beacon, N. Y. (gard., F. E. Witney).
Orchids.—Collection, not less than 12 species and varieties (species to be considered in preference to varieties), covering 25 square feet of table space—1st, Clement Moore. One Cattleya, in bloom—1st, F. E. Lewis; 2nd, Clement Moore. One One Cattleya, in bloom—1st, E. E. Lewis; 2nd, Clement Moore. One Oncidium, in bloom—1st, Henry W. Beettger Estate. Display of Laclio-cattleyas, Brasso cattleyas, Brasso-lælias, or hybrid Cattleyas. Gold medal or \$25—1st, Clement Moore (gard., J. P. Mossman).
Special Prizes—R. D. Foote, Morristown, N. J. (gard., J. K. Lindabury), four bunches white and five bunches black grapes; Henry W. Boettger Estate, plant of Nephrolopis Exaltata Scottii: Mrs. F. A. Constable, Mamaroneck, N. Y. (gard., James Stuart), collection of cut Nerines; Seven Oaks, Mamaroneck, N. Y. (gard., P. W. Popp), display of dahlias; James B. Duke, Somerville, N. J. (gard., A. A. Macdonald), vase of rose Ophelia; Peter Hauck, Jr., East Orange, N. J. (gard., Max Schnoider), pan of chrysanthemum "Glory of Seven Oaks."

The eighty-third annual show of the American Institute, New York, was held in the Engineering building, on November 4 to 6. inclusive.

The judges were: Eugene Dailledouze. Peter Duff, Geo. Middleton, J. G. McNicoll, Edward Reagan and Arthur Herrington.

This was said to be, and apparently was, the largest and best exhibition which the American Institute has ever held.

### AWARDS TO PRIVATE GROWERS.

Y. 1st, best collection of flowering Begonias, with Begonia Gloire de Lorraine; 1st, best collection of single Mums; 18 blooms Mums, and for vase of 10 blooms white Mum, plant Garza; tandard plant Mum, Max Schneider, gardener to Peter Hauck, Jr., Orange, N. J.—1st, 100 blooms serimson Mums; vase of Wi best vase, 12 blooms one variety, Carnations;

## **Worth-While Trees and Shrubs** GROWN AT ANDORRA

The Andorra Way gaves specimen trees

the Andorra Way gave specified these that are large cough to be effective from the first. Nearly all ornamentals can be planted successfully late in the season and the opting of string will fine your late being rich with shorter.

At t Andorra now every development to its hower of begins the field of terms of the field of the

### PHILADELPHIA SHOW.

The annual fall flower show of the Pennsylvania Horticultural Society opened in Philadelphia on November 3. The exhibit as a whole was a most attractive one, and included many interesting features. Coolkenny silver cup for the best bush chrysanthemum plant was won by Joseph Hurley, gardener to Mrs. Thomas B. Hunter. The specimen mum plants exhibited were the best seen in Philadelphia for some years. From the gardener's viewpoint, one of the chief attractions of the show was the new Dracaena Longii, exhibited by Thomas Long, gardener to George W. Childs Drexel. The plant is of the straight growing type, green leaves, two and a half inches wide at centre, gradually tapering to a point with a white stripe running through the centre of the leaf.

A list of the prize winners is given be-

CHRYSANTHEMUM PLANTS.

low:

CHRYSANTHEMUM PLANTS.

Display of 4 plants, Japanese, 4 varieties—1st, Mrs. Jos. F. Sinnot (gard., David Ingram); 2nd, Mrs. Thos. P. Hunter (gard., Joseph Hurley). Display of 3 plants, 3 varieties 1st, Mr. C. B. ### BOSTON SHOW.

The annual chrysanthemum exhibition of the Massachusetts Horticultural Society held in Boston, November 5-8, was well up to the average of such shows. Specimen plants were less numerous, but cut blooms were in greater abundance than usual and of splendid quality, so much so that it would almost seem that the big blooms which have been in display here for some years are coming back in favor again. Miscellaneous exhibits were numerous, the groups of foliage and flowering plants, orchids and carnations being particularly good.

larly good.

William Watson, gardener to J. I. Bailey, won first for pair of two specimen plants. A. M. Davenport led for single specimen, and also won a silver medal for the best chrysanthemum plant in the show. H. Wetterlow, gardener to Mrs. Lester Leland, took both first and second for six plants, distinct, carrying six flowers each, in not over 8-inch pots.

William Thatcher, gardener to Mrs. J. L. Gardner, used the large English flowered winter begonias, such as Winter Cheer and Mrs. Heal, orchids and streptocarpi freely in his prize group.

J. T. Butterworth had a fine orchid group, including some fine Odontoglossums, also numerous hybrid cattleyas.

E. H. Wetterlow led for both Lorraine and Cincinnati begonias with grand plants. Alex. McKay, gardener to E. A. Clark, took the other prizes. E. H. Wetterlow received a first-class cultural certificate for splendidly-flowered Turnford Hall begonias. William Downs, gardener to E. Webster, received a silver medal for three large and grand flowered specimens of begonia. Mrs. Heal, one of the best English varieties.

In the palm classes W. Whitman (gardener, begonia. varieties.

three large and grand flowered specimens of begonia. Mrs. Heal, one of the best English varieties.

In the palm classes W. Whitman (gardener M. Sullivan), George Page, gardener to Mrs. Frederick Ayer, and William Thatcher divided the premiums.

D. F. Roy, gardener to H. E. Converse, won first for twenty-five blooms, twenty-five varieties of chrysanthemus, also for twelve Japanese incurved and twelve Japanese reflexed. Alexander McKay led for twelve Japanese Other successful competitors on the named varieties collections were: A. E. Griffin, gardener to E. L. Stone: E. H. Wetterlow, Charles D. Sias, W. S. Russell and E. Townsend, gardener to Mrs. Lathrop Brace.

For vase of two blooms, white, Alex. McKay won with superb William Turner's. He also had the best yellow in Col. Appleton magnificent flowers and led for red with Leslie Morrison. H. W. Vose had the best pink in Chieftain. For best vase of fifty blooms, arranged for effect, there were numerous entries. Frank P. Putnam won for single flowered chrysanthemums. He also had the best pompons and anemones. There were eleven entries for dinner-table decorations of chrysanthemums, Single-flowered chrysanthemums were used exclusively.

In the carnation classes flowers were of grand quality. The leading exhibitors were: C. S. Stout, George Page and Charles D. Sias. Thomas T. Watts, H. Stewart, gardener to Miss C. Warren, and others contributed groups. E. L. Lewis, gardener to Col. F. Mason, had the best twelve varieties of vegetables, and F. E. Sargent led for eight varieties. The individual fruit and vegetable classes were well contested

## horburn's **BULBS**

To the gardener:

OU, who depend for vour profit upon the reliability of seeds and bulbs. feel rightly that a bargain is not of the first importance.

Yet we often have an overstock which we are able to supply below the market, and would be very glad to send you particulars on request.

If you have not received a copy of our 1914 Bulb Catalog, send for it. We printed one especially for you. It contains a wealth of information which will be of use to you.

A large proportion of our business is with those who "raise for profit." Think this over, and let us hear from you.

## OYSTER BAY (N. Y.) SHOW.

The third annual chrysanthemum show of the Oyster Bay Horticultural Society was a decided success, much in advance of last year.

## 

## A Very Personal Invitation

W HILE you are at the Gardeners' Convention in Philadelphia this month, Mr. Wintzer and I want you to come out to West Grove and visit our place.

Mr. Wintzer has some of his choice Cannas blooming in the greenhouse. In them you will see the forerunner of some new Swastika brand varieties.

To hear Mr. Wintzer To hear Mr. Wintzer talk of his canna children and how he "brings them up in the way they should go," is a genuine pleasure in itself.

Our way of storing the thousands and thousands

Robert Pyle, Pres.

ROSE RHEA READ.

of Canna bulbs will also interest you,

Then there are something like 400 varieties of roses in various stages of readiness for Spring sales—not to mention a goodly assortment of shrubs, both in the cold cellars and open ground.

I am planning to attend the Convention. So make yourself known to me and doubtless we can arrange to go out to West Grove together, which, indeed, would be pleasant for me.

If you can't come, then do the next best thing and send your name for our new catalog, soon to be ready.

THE CONARD 2 JONES COMPAN!

Antoine Wintzer, Vice-Pres.

SWASTIKA BRAND CANNAS West Grove, Pa.

A fine silver tray, offered by the North! County Garden Club, to be won three times. only attracted two exhibitors, but as the prize was offered rather late, we anticipate more competitors next year.

The chief winners were as follows:

The chief winners were as follows:
Group ornamental plants—1st, John T. Ingram. Group of mums—1st, James Duckham.

Best collection bardy mums, 25 varieties—
1st, A. Walker. Collection outdoor flowers—
1st, J. Duthie. Largest bloom in show—1st,
J. Devine. The same exhibitors won the remaining prizes,

maining prizes,

C. Mills was awarded a cultural certificate for a collection of vegetables.

The judges were Joseph Robinson, John Chapman and F. Honeyman.

F. KIRKHAM, Secretary.

## TARRYTOWN, N. Y., SHOW.

The sixteenth annual autumn exhibition of the Tarrytown Horticultural Society was held on Wednesday, Thursday and Friday, November 4, 5 and 6, at the Music Hall, Tarrytown. Both in the number and ex-cellence of its exhibits this surpassed any previous efforts of this society. The several large and handsome exhibits of ornamental foliage and flowering plants staged in the center and at other points of vantage, were a pronounced and splendid feature of this show.

The vases of cut blooms of single stemmed Chysanthemums shown with foliage of different kinds, and occupying the entire stage, were a magnificent feature and of high quality, while the several handsomely decorated dinner tables on Thursday afternoon added much to the beauty of the scene. Specimen blooms of Mrs. H. Stevens, Leslie Morrison, Pockett's Crimson,

Wm. Turner, Rose Pockett, Mary Dunnellan, Otto H. Kabn, Elberon, Lenox, Anne Angus, Wm. II. Duckham, Mrs. Gilbert Drabble, Reg. Vallis, Lady Hopetoun, Meudon, Lealie May Bennett, and W. Mease, all showed excellent form. In the vegetable section, the prizes offered helped very much in bringing out a very large and meritorious display. In the non-commercial classes, R. M. Johnson, gardener to Wm. B. Thompson, Yonkers, N. Y., received certificate of merit for a vase of pretty, new mammoth type pink Verbenas. He also won the sliver cup for largest number of prizes taken during the exhibition; and 1st for each of following: Table of decorative plants; for six heads of Celery; for collection of six vegetables; best six blooms yellow Mums; best specimen bush plant, white; best specimen bush plant, pink; best specimen bush plant, any other color; group of palms, and lastly for specimen Farleyense fern. Charles R. Russell, gardener to Finlay J. Shepard, Tarrytown, N. Y., for six sprays of cut orchids won a silver cup, for new plant, certificate of merit, and one for specimen Kentia, and for display of orchids. James Valentine, superint-odent of Mrs. F. E. Lewis, Ridgefield, Conn., had the best 12 blooms of Chrysanthemums, and 12 blooms variegated Carnations. John Canning, gardener to Adolph Lewisohn, Ardsley, N. Y., was first for each of following; 20 blooms Mums; 36 blooms, 24 blooms, and 12 vases of single Mums; for six plants of Chrysanthemums. Thos. A. Lee, gardener to Mrs. Carl Victor, Ardsley, N. Y., for six blooms of Chrysanthemums, and for a bunch of 50 single blue Violets. W. F. Ross, gardener to Mrs. Carl Victor, Ardsley, N. Y., for six blooms of Chrysanthemums, and for a bunch of 50 single blue Violets. W. F. Ross, gardener to Mrs. S. Hermann, Tarrytown, N. Y., led for three blooms, and Robt. Grieve, gardener to Mrs. S. Hermann, Tarrytown, N. Y., led for three blooms, and Robt. Grieve, gardener to Mrs. S. Hermann, Tarrytown, N. Y., led for six vases pompon Mums. Frank E. Witney, gardener to Winthrop Sargent,

arranged bridal bouquet; best 12 blooms of scarlet Carnations; best 12 blooms of dark plak Carnations; best 12 blooms light pink, and best 12 blooms crimson Wm. Brock, gardener to R. Delafield, Tuxedo Park, N. Y., won a silver cup for 12 blooms Killarney Queen Roses, and was first for 12 blooms original pink Killarney (silver cup), best 50 blooms of assorted Roses (silver cup), and first for each of the following; 12 blooms Killarney Brilliant Roses; best 12 blooms original White Killarney Roses; best 12 blooms white Roses; and for best 12 blooms of crimson Roses, with variety Hadley. Chas. Ruthorn, gardener to Eugene Meyer, Jr., Mt. Kisco, N. Y., first for 12 blooms of Roses not American Beauty, three varieties. Frank C. Luckenbacher, gardener to Paul M. Warburg, Hartsdale, N. Y., first for best basket of cut flowers. W. H. Waite, superintendent for Samuel Untermeyer, Yonkers, N. Y., first for best centerpiece for a table. M. Fitzgerald, first for dinner table decoration. Wm. Jamieson, gardener to E. Berolzheimer, Tarrytown, N. Y., first for best Begonia Gloire de Lorraine, Geo. W. MeIntosh, gardener to Dr. C. C. Brace, Tarrytown, N. Y., first for best 18 blooms, three varieties, Carnations. Wm. Kastberry, gardener to F. W. Vanderbilt, Hyde Park, N. Y., first for best 12 American Beauty Roses; first for best 12 pink Roses, and for best 12 yellow Roses.—Exchange.

## DUTCHESS COUNTY (N. Y.) SHOW.

Vanderbilt; 2nd, Valentine Burgevine, 12 crimson Roses—1st, F. W. Vanderbilt, with Hadley; 2nd, Ogden Mills, with Richmond. 12 yellow Roses—1st, F. W. Vanderbilt, With Hadley; 2nd, Ogden Mills, with Richmond. 12 yellow Roses—1st, F. W. Vanderbilt, 2 white 1st, Valentine Burgevine, 12 pink—1st, W. Sargent, N. H. Cottam exhibited a splendid collection of Dahlias for so late in the season.—F. E. Witney, Cor. Sec'y.

## TUXEDO PARK SHOW.

The annual flower show of the Tuxedo Horticultural Society was held in Tuxedo Club on October 30 and 31 and November I. It being the finest show the society has ever held in most of the classes competition was very keen. The chrysanthemums were the finest ever shown here, David S. Millar winring the 18 distinct varieties with W. E. Tricker, Daily Mail, Woodmason, Gilbert Drabble, Wells' Late Pink, Mrs. R. H. Boggs, Lady Hopetown, Wm. Kleinheinz, F. S. Vallis, Gertrude Peers, James Fraser, Mrs. H. Stevens, Mrs. R. C. Pulling, Pockett's Crimson, Mrs. E. Wild, Mrs. G. W. C. Drevel. Thomas Wilson won the 12 distinct varieties with Wm. Turner, Mrs. D. Syme, Hetty Wells, H. E. Converse, W. E. Georgeous, Wm. Kleinheinz, Rose Pockett, Daily Mail, Nakota, Mrs. G. W. C. Drexel, M. Louiscaw Rousseau. The groups of mis-cellaneous plants, mums and ferns were all very fine and tastefuly arranged. Roses were shown to perfection. In the class for 18 pink Mrs. C. Russell were shown by Wm. Brock, Joseph Tansey and D. S. Millar, with 6-foot stems. There was good compe

of tition in all the classes for carnations. Joseph Tansey, gardener to Mr. H. M. Tilford, won the prize for the most meritorious exhibit, also for group of mums, and the president's prize for the best vase of roses in the show with a vase of Sunburst. David S. Millar, gardener to Mr. G. G. Mason, won the cup for 6 mums, 12 carnations, 12 roses.

The judges were Mr. R. Williamson, Mr. A. Bieschke, Mr. Wm. Waite, who made the

awards as follows:

### ELBERON (N. J.) SHOW.

The fifth annual Chrysanthemum show of the Elberon Horticultural Society was held successfully in the Casino, Asbury Park, on the above dates. The arrangements were efficiently carried out and were creditable to George Masson, the secretary, and his committee, consisting of C. O. Duncan (chairman), A. Bauer, Thomas Hambleton, R. B. Allen, W. R. Seymour. The judges were: W. H. Waite, George Middleton and Peter Duff. Nearly 3.000 people attended. The dinner table decorations on the Thursday were very effective and much appreci-

The principal prize-winners were:

The principal prize-winners were:
Thomas Hambleton, gardener to C. A. Wimpgheimer, Long Branch; A. Bauer, gardener to Henry Goldman, Deal; R. B. Allen, gardener to F. R. Guggenheim, Elberon; Charles Hurn, gardener to Daniel Guggenheim, Elberon; George Masson, gardener to Frederick Frelinghuysen, Elberon; Percy Hicks, gardener to H. B. and B. S. Borden, Oceanic; William Dowlin, Seabright; Joseph Mills, gardener to George Gould, Lakewood; C. O. Duncan, gardener to Mrs. Washington Wilson, Elberon; C. De Wilde, gardener to S. Rikes, Jr., Red Bank; W. R. Seymour, gardener to S. M. Goldsmith, West End; D. C. Kelly, gardener to J. B. Greenhut, West End; David Gustafson, gardener to Mrs. Hamilton Kean, Elberon; Newman & Legg, florists, Manasquan; Herbert Kruschka, florist, Asbury Park, R. B. Allen led for the group of Mums, with G. Masson second; while for the group of ornamental, flowering and foliage plants, the winners were Chas. Hurn and R. B. Allen. For 24 blooms in eight varieties, there were five entries, and Hicks and Bauer were first and second.

## NEW BEDFORD (MASS.) SHOW.

The annual chrysanthemum exhibition of the New Bedford Horticultural Society was held in Library Hall on November 3 and 4. and certainly reflected great credit on the few who exhibited. Although the exhibitors were few in number the show was not loking in material and the flowers were as fine as the writer ever saw.

Peter Murray, of Fairhaven, had a total display of palms, ferns and mums not for competition; Joseph V. Pierce, of New Bedford, exhibited a vase of L roses of exceptional quality and a vase of carnations in variety which showed ex el-lent culture: James Garthly, formerly gardener for H. H. Rogers, displayed a fine collection of greenhouse plants, conspicuous 

William Turner was the center of attraction while a vase of 12 Mary Farnesworth was a close second. Among the specimen blooms the following from the converse Estate were especially fine: Leila Filkins, Cheltoni, Marquis V. Venosta, Mrs. W. Duckham, Alice Lemon and Adonis.

Special mention should be made of the group covering 40 square feet, both of which were very fine, competition being close, and the man who could have beaten the cup winner would have had to step some.

The awards were as follows:

The awards were as follows:

Group of chrysanthenums, arranged for effect, not over 40 square feet; Dr. E. R. Humphires cup Won by D. A. Roy; 2nd, A. E. Griffin. Collection of hardy mums, not less than 12 varieties; silver medal—Won by Peckham Floral Company. Bronze medal won by D. F. Roy. Best 6 blooms chrysanthemum Harry E. Converse; Converse cup—Won by A. E. Griffin. Best 18 blooms, distinct varieties; Galen Stone cup—Won by D. F. Roy. Six plants, 6 flowers to a plant, not over an 8-inch pot Cup won by D. F. Roy. Vase of 18 flowers, I variety—Cup won by A. E. Griffin with a beautiful vase of William Turner, Vase of 12 blooms, 1 variety; silver medal of the society Won by A. E. Griffin with Mary Farnesworth.

## DOBBS FERRY (N. Y.) SHOW.

The Thirteenth Annual Flower Show of the Dobbs Ferry, N. Y., Horticultural Society was held November 4 and 5. The 6 and 7, was a great success and much credit is due its officers.

credit is due its officers.

There were 48 classes in the schedule, of which 12 were for fruit and vegetables. Prominent among the prize winners in the plant and flower sections were: J. Andward, Mrs. D. E. Oppenheim (gard., A. McDonald), Mrs. F. Dunn (gard., T. Richardson), J. A. Townsend (gard., E. Howe), I. T. Bush, W. H. Brown (gard., Mr. Holgerson), C. Wilson, Mrs. J. Fraser (gard., H. Hayms), Mrs. Henry Draper (gard., H. Wells), D. F. H. Backland (gard., J. Caselli), St. Christopher's Home (gard., P. Clinton), J. Anderson and H. Keiling.

## NEW LONDON (CONN.) SHOW.

The Annual Chrysanthemum and Fruit Show of the New London Horticultural Society was held November 4 and 5. The show was acknowledged by many as one of the best in the history of the society. Numbers of people visited the exhibition on both days.

Among the exhibits of chrysanthemums was a group of singles staged for non-competition by the Harkness Estate, and called forth admiration from judges, visitors and president; also a very fine trained specimen exhibited by the Palmer Estate.

stanley Jordan secured first prize in the class for 12 blooms, any variety; Ernest Robinson, foreman, Morton F. Plant estate, second; Alfred Flowers, of the G. Palmer estate, third. The latter had some very wonderful blooms of Wm, Turner. In the classes for vases of four distinct colors—M. F. Plant first, for four white and four pink; Harkness estate first for four yellow and four crimson. John Maloney, gardener to the Guthrie estate, secured first for best group of flowering and foliage plants. Carnations were shown by Harkness estate. Among exhibitors of bush chrysanthemums were the Mitchell estate, Gustav Newman, gardener, who secured chief honors. The latter also made a splendid exhibit of fruit. Alfred Flowers also showed some fine apples. The latter secured first in vegetable class for 12 varieties.

On the morning of the second day table decorations by ladies were the feature. Mrs. Edward Smith secured first prize; Mrs. Stanley Jordan second; Mrs. John Humpbrey was third. The judges were: Frank Conine, Stratford; Mr. Griffin, of the Landers estate, and Donald Miller, of the B. A. Armstrong estate.

MENLO PARK (CAL.) SHOW.

The annual show of the Menlo Park Horticultural Society, held October 23 to 25, proved a decided success in every way. was conceded by everyone to be the best ever held by the society. The spacious hall allowed everything to be staged for the best effect.

The orchid groups were first class. J. A. Carbone, of Berkeley, staged a magnificent collection of forty different varieties, includmg some fine brasso-cattleya and lælia hybrids. The exhibit of David Bassett, gardener for L. Stern, attracted more attention from the public. While not containing so many fine hybrids as Mr. Carbone's, it contained some fine cattleyas, kelias, oncidiums, phalænopsis, dendrobiums, vandas, odontoglossums and several curious rare orchids.

Foliage and decorative plants were finely shown by J. Sinclair, gardener for Mrs. J. B. Corvell, David Bassett, J. Paunicka, gardener for C. Lathrop, and C. Ehrlich, gar-

dener for Mrs. Slade.

The cut chrysanthemum classes brought out strong competition. The following varieties stood out prominently: Mrs. Gilbert Drabble, Wm. Turner and Maud Jeffries, in white; Lenox, F. S. Vallis, Chrysolora, and Mrs. J. C. Neill, yellow; Elberon, Wells' Late Pink, Morton F. Plant, in pinks; G. W. Pook, J. Lock, Mrs. H. Stevens, Reginald Vallis, Ongawa and Glenview, in other colors.

Tuberous begonias were fine, both in pots and cut blooms, L. Stern's exhibits containing the latest European novelties of 1914. Although a little late, dahlias were good and brought keen competition from the Menlo Park and San Mateo growers.

Carnations were never shown better. Gorgeous, with 3-foot stems, would be hard to beat. White Wonder, The Herald, Princess Dagmar, Enchantress and Yellowstone were also fine.

The floral exhibits on the third day were fine and helped the gate receipts considerably. In the table decorations, A. McDonald won the cup donated by the Chamber of Commerce of Palo Alto, his table consisting of a small lake with gold fish, an island in the centre decorated with orchids, and water lilies in the water. Mrs. Lee, of Palo Alto, was second.

H. L. Goertzhain, president of the society, staged a lot of cut blooms not for compe-PERCY ELLINGS, Secretary. tition.

### PASADENA (CAL.) SHOW.

The seventh annual chrysanthemum show of the Pasadena Horticultural Society opened in the Hotel Maryland, October 22, and continued during October 23 and 24. Not only from the point of view of entries, but also from quality of stock shown, this exhibition was beyond anything else in the history of the society

It should be explained that here practically all exhibition chrysanthemums are grown in the open air in summer and covered later with canvas. The result is larger and more substantial flowers than are grown in the East under glass, though in some cases the flowers lack finish. The present year they were wonderful blooms in every way owing to the cool summer and the absence of early fall rains.

The judges, consisting of Thos. Chisholm, Wm. Farrell, H. R. Richards, Wm. Hertrich, J. Jannoch and Alex. Urquhart, had considerable difficulty in making their awards, so close was the competition in some cases.

In the evening the judges and officers were the guests of Thos. Chisholm at an elegant dinner which certainly did credit to all. A most enjoyable time was had, and both Mr. Chisholm and his able manager, Mr. Kennedy, exerted themselves to the utmost to make things agreeable all round.-Ex-

### TARRYTOWN HORTICULTURAL SOCIETY.

The regular monthly meeting of the Tarrytown (N. Y.) Horticultural Society was held Wednesday evening, October 21.
The judges awarded first prize for celery to H. Wells, gardener to Mrs. H. Draper, Dobbs Ferry. Other good exhibits of celery were staged by J. Mooney and J. Elliott. There was also a fine exhibit of apples by S. Porteous. Wm. Williams, J. Hall, J. Grant and Samuel Porteous were nominated for active membership.

A committee has been appointed to arrange for a social gathering and ladies' night at the November meeting. J. A. LEE.

Corresponding Secretary.

### NEW JERSEY FLORICULTURAL SOCIETY.

The regular meeting of the New Jersey Floricultural Society was held in Orange, N. J., on Monday, November 2. The meeting was known as a chrysanthemum night and some excellent blooms were on exhibition. For the best 12 blooms in any variety with stems not less than two feet; Mrs. Henry Graves, Orange, N. J., was first; C. C. Goodrich, W. Orange, N. J., second; A. B. Jenkins, third. Cultural certificates were awarded to S. & A. Colgate, Peter Hauck, Jr., and Mrs. A. J. Moulton for decorative chrysanthemums. Mrs. A. J. Moulton received a cultural certificate for mushrooms and C. W. Baker, of Montclair, a certificate of merit, for hardy chrysanthemums. judges were George Wraight, Frank Drews and Max Schneider.

GEO. STRANGE, Secretary.

## OYSTER BAY (N. Y.) HORTICULTURAL SOCIETY.

The regular meeting of the Oyster Bay (N. Y.) Horticultural Society was held in the Fireman's Hall, October 28. The winners in the monthly exhibit were A. Walker, cauliflowers; J. Duthie, chrysanthemums; F. Petroccia, pears. The next meeting will be held November 25 and all future meetings during the winter months will be called for 2 o'clock in the afternoon, instead of at night as in the past. Exhibits for next meeting—1 pot of primula any variety; 12 carnations: 3 leeks.

The third annual chrysanthemum show was held October 30, and was a great success, although the Glen Cove and New York shows were on the same date. The prizes were a great deal more valuable than those of last year and exhibits more numerous. The principal winners were James Duthie, gardener for E. M. Townsend; J. Duckham, gardener for E. F. Whitney; J. T. Ingram;

## Don't Neglect Fall Spraying

Demand It

**Modern Methods** 

TRADE MARK REG. U. S. PAT. OFF.

It pays to get in fall spraying whenever possible. There is danger in waiting for spring spraying. "Scalecide" is better than any other dormant spray, either for insects or fungi. Costs no more than lime-sulphur or the less effective mixtures. Our booklet "Scalecide, The Tree Saver" mailed free. B. G. Pratt Co., Dept. "4", 50 Church St., N. Y. City. bolm Devine: J. Blanc, A. Walker, gardener (sympathy from this society to Mr. 1. A. 1. Britle: I. Evde, gardener to L. C. fin Shaw on the death of his daughter.

A. A. Pierson o Cromwell Comm. exthey received the society's bronze medal. W. A. Manda exhibited some novelty dahlias and also received a bronze medal.

C. Mills, superintendent to J. S. Blackton. but up several fine exhibits and received cul-

om il certificates.

P. KIRKHAM, Secretary

## THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

An interesting and well-attended meeting of the Westeliester and Fairfield Horticultural Society was held at Greenwich, Conn., November 13, President Williamson presiding. One life member and one active member were elected to membership. preliminary statement was made by the Fall Show Committee, showing the recent exhibition at New Rochelle, N. Y., to have been a financial success as well as an ex-bibition of the gardeners' art of superior quality. One of our highly honored members, Mayor-elect John M. Brown, of Stamford, Conn., in a happy vein made the presentation of prizes won at the recent exhibition, and assured the members of his continued hearty support in his personal as well as official capacity. The nominations tor officers of the society for the ensuing year were next in order. A communication was read from the secretary of the National Association of Gardeners setting forth the principles of the National Co-operative Committee as adopted at a recent meeting The W. & F. Society is in hearty accordwith the National Committee in their efforts in behalf of the gardener and the advancement of horticulture, and the local committee will endeavor to assist the National. Committee in everything tending to such advancement

A vase of chrysanthemums was on exhibition purposely to start a discussion as to what constitutes a "Terminal Spray." Opinions on this subject vary. The growing and exhibiting of the single and pompom varieties of mums is becoming yearly more popular, and if the future schedules of the fall exhibitions are to contain the classification "Terminal Spray" we suggest that the "Chronicle" obtain and print in a prominent place the findings of the Chrysanthemum Society of America in the matter, thereby giving intending exhibitors of these popular flowers a chance to prevent disqualifications of exhibits on merely technical points. The next meeting of the society will be December 11. P. W. POPP,

Corresponding Secretary.

## NASSAU COUNTY HORTICULTURAL SOCIETY.

The monthly meeting of the Nassau County Horticultural Society was held November 11 at Glen Cove, N. Y. President II. Gaut in the chair. The feature of the meeting was the competition for the president's prizes for table decorations by assistant gardeners, and some very fine tables were displayed by these promising gardeners of the younger set. 1st, Robert Jones, assistant to F. Honeyman on the Chubb estate; 2nd, Chas. Parr, assistant to J. W. Everitt on the John T. Pratt estate; 3rd, Arthur Book, assistant to President II. Gaut on the H. L. Pratt estate. There were six competitors. Mrs. George F. Baker was elected an honorary member, and Mr. J. Cartwright was charter members of the society, was preelected to active membership. The secre-tary was instructed to write a letter of

Mr. and Mrs. W. D. Guthrie, of Locust Valley, L. I., offered a silver cup for comibited some novelty pempons for which petition at the next chrysanthemum show.

which was accepted with thanks.

The president presented the Mrs. H. L. Pratt silver cup for table decoration at the fall show to J. W. Everitt, and also the Mrs. F. S. Smithers special prize of a set of hooks to John F. Johnston for collection outdoor flowers, after which Vice-president Win. Gray presented to President II. Gant the Mrs. F. S. Smithers silver cup for 50 varieties bardy pomponi chrysudhemums, This cup has been in competition six years and was won for keeps this year by the recipient. Next meeting Wednesday arrernoon, December 9, 1914.

HARRY JONES Corresponding Secretary.

### TUXEDO HORTICULTURAL SOCIETY.

The regular monthly meeting of the Tuxedo Horticultural Society was held on November 11. President David MacIntosh in the chair. A financial report was read in connection with our flower show, which was satisfactory. The nomination of officers for 1915 takes place at our next meeting on December 2, when we are also to have the pleasure of a talk from James MacMachan. Quite a few of the gardeners in the Park intend making the trip to Philadelphia to attend the convention of the N. A. G. when some of them ought to be heard of at the bowling tournament. John Kelly was admitted to membership.

THOS, WILSON, Secretary.

## CONNECTICUT HORTICULTURAL SOCIETY.

The first November meeting was held in the County Building, Hartford, on Friday evening, the 13th, at 8 o'clock. President Huss presided. There was an unusually fine display of chrysanthemums, all sizes and varieties being represented. In the collection exhibited by President John F. Huss was a vase containing six large white chrysanthemums "William Turner." The size of these beauties was remarkable, being at least twenty-four inches in circumference. The Park Department had an exhibit of large chrysanthemums, each specimen exciting the keenest admiration. Mr. Warren S. Mason, of Farmington, exhibited some fine seedling geraniums (Lemoines Hybride). He also displayed a splendid collection of pompon and single mums, with some large varieties. Alex. Cumming. Jr., the rose expert with A. N. Pierson, Inc., of Cromwell, Conn., exhibited a new rose named "Ophelia," salmon color and very tragrant This is a beauty, and no doubt will be a record-breaker as a seller. George W. Fraser, of the Connecticut Agricultural College, Storrs, had on exhibition a handsome pink rose, Mrs. A. G. Gulley.

Mrs. C. H. Sierman, Mr. H. A. Pinney and Mr. George W. Fraser were named as judges and they found the task a hard one. lection of \$16.09 was taken up for the Belgian Relief Fund. Mr. G. H. Hollister read an article from The Gardeners' Chronicle of America on "Propagation of Ornamental Trees and Shrubs" for which he was ac-

corded a hearty vote of thanks.

A local co-operative committee of the National Association of Gardeners was appointed at this meeting, viz.: Mr. II. A. Pinney, Mr. W. W. Hunt and Mr. C. II Sierman. Three new members were added to our roster. Mr. P. A. Sears, one of the of October, 1914 ent, and made a few reminiscent remarks

ALFRED DIXOX Societa

## FORCING FALL TOMATOES.

Growing tomatoes in the greenhouse in the fall is not as easy an undertaking as the inexperienced may think, at least in northern latitudes. Tomato plants of the same variety grown in the same greenhouse and soil and by the same grower act very differently when grown in the fall and spring. The fall grown plants are more spindling, not as vigorous and do not, as a rule, set fruit as freely as those grown in the spring and summer months. The fall grown plants are more frequently attacked by mildew, and the mosaic disease, and apparently are less resistant to a good many troubles than those grown in the spring.

There probably is but one chief reason for this and that is the different weather conditions. The plants for the spring crop are started during the short days of winter and the heat supplied for their growth is very largely artificial. The plants for the fall crop are grown during the hottest part of the summer, and no artificial heat is required. The temperature in which the plants are grown in summer is usually considerably higher than that in which they are grown in winter. This fact accounts for the summer grown plants being more slender and less "hardy" than the winter grown plants. It than the winter grown plants. It takes from 2 to 3 months to grow plants of sufficient size in winter, while in summer plants may be grown to about the same size in from four to six weeks.

On the other hand after the plants are set in the permanent beds in the fall the days grow shorter rapidly and the cold weather soon comes on. After the plants are set in the spring the days grow longer and warmer.

To be successful with fall grown tomatoes, the plants must be started early enough so that the Tomatoes will set and grow to nearly or quite full size before the dark cold days of early winter begin. As soon as the night temperature in the houses falls below 60 degrees it is advisable to fire the boilers.

Tomatoes grown in the fall do not require as much water as those grown in the spring. A sufficient amount of water should be used to keep the plants growing all of the time. but too much water will tend to make the plants tender and to grow too much vine for the amount of fruit borne. Care must be taken when watering not to wet the foliage during dull weather or near night. Foliage diseases, such as mildew, are very likely to get started unless such precautions are taken.

There is no advantage in letting the plants grow very tall. After three or four good clusters of fruits have set, the tops should be cut off and all laterals kept out or pinched off.

The yield from the plants when grown in the fall is usually much less than when grown in the spring. C. W. WAID.

## Standard Cyclopedia of Horticulture

THE new Standard Cyclopedia of Horticulture has been freshly written in the light of the most recent research and experience. It is not merely an ordinary revision or corrected edition of the old Cyclopedia, but it is a new work from start to finish with enlarged boundaries geographically and practic-

ally; it supersedes and displaces all previous editions or reprints of every kind whatsoever.

It is the fullest, the newest, the most authoritative of all works of its kind and constitutes the most conscientious attempt that has ever been made to compress the whole story of our horticultural thought, learning and achievement into one set of books. The owner of the Standard Cyclopedia of Horticulture will have at hand in this work a means of quickly satisfying his need for authoritative information. It is both an Encyclopedia and a Manual, for with the aid of its Synopsis and Key, amateur and professional alike may quickly identify any plant, shrub or fruit contained within the set, and then receive expert instructions for its cultivation.

## "IN THE LAST ANALYSIS RESULTS ARE WHAT COUNT!"

The Chrysanthemums we have distributed every year in spite of all you hear to the contrary are still the Prize Winning varieties. Our catalogue for 1915 is filled from cover to cover with a list of high class stock which will eclipse anything we have previously distributed; Antigone, Earl Kitchener, Bob Pulling, etc., are wonders!

The list includes also Novelties in Early Flowering and Single types.

In New Roses, don't forget, White Shawyer and Mrs. F. F. Thompson, the pure white and shell-pink sports of Mrs. Geo. Shawyer, also Hoosier Beauty, the western scarlet, and Dickson's Novelties.

Novelty Carnations will include Alice, Laura Weber, etc.

Catalogue for 1915 has been mailed; if your copy has not been received, drop us a line.

Compliments of the Season

CHARLES H. TOTTY, Madison, N. J.

## MATCHLESS A GREAT SUCCESS

This remarkable new white carnation has made good every prediction that we made when we disseminated it last year.

Reports that come to us from all over the country are all to the effect that **MATCHLESS**, because of its vigorous constitution, freedom of growth, earliness and wonderful production, is the greatest advance obtained in carnations in many years.

Many of the growers commenced cutting high-class flowers as early as Aug. 20th. One large grower up to November 1st had cut five flowers per plant and reports that his benches are now carrying a large crop of the highest quality of bloom.

Our own experience with MATCHLESS during the four years we have been growing it for the New York market, has proved to us that MATCHLESS is as productive as any existing variety and can be grown to perfection by the ordinary grower. These characteristics, together with the high quality of flower and the fact that MATCHLESS is non-bursting, making it possible to utilize 100% of the blooms, make MATCHLESS one of the most profitable varieties to grow.

Consensus of opinion is that MATCHLESS has taken its place as the leading white carnation in all respects.

Recognizing that there will be an enormous demand for **MATCHLESS** this year, we have devoted two houses entirely to stock plants and will be in position to fill every order that comes to us with cuttings of the highest quality.

# SINCE 1847

THE FIRM OF PETER HENDERSON & CO. was founded in 1847, and the 68 years of success that are behind Henderson's Tested Seeds must and does make them the best that it is possible to buy. In your grandfather's day Henderson's was the standard by which other seeds were judged, and the same condition exists in 1915. Our methods of seed trials and seed testing, which were the best three generations ago, we have improved upon from year to year and today are still the best.

The unknown quantity on your garden and farm is the quality of the seeds you sow, and you cannot be too careful in making sure that you obtain the best procurable. For many years the name of Peter Henderson & Co. has become indissolubly linked with all that is best in seeds, because our constant purpose has always been—and will continue to be—to supply to our customers pure seeds of the highest germinating power only.

## Three Generations

The business founded by Peter Henderson is still carried on by his son, Charles Henderson, Peter Henderson, son of Alfred Henderson (deceased), and Howard M. Henderson, son of Charles Henderson, thus insuring its continuance along the lines laid down by its founder.

In this country, where quick transitions in business are common, the worth of a house carried successfully into the third generation should inspire confidence. In no other business is this factor more essential. The purchaser of seeds should consider the reputation of the house seeking his patronage before buying.

Our Manual of "EVERYTHING FOR THE GARDEN," for 1915, we consider the best we have ever issued, and the seeds, plants, bulbs, etc., have been grown and selected with the same conscientious care which has been our successful endeavor for 68 years. Those who have not received this catalogue may obtain it free upon application by mentioning Gardeners' Chronicle. We have in preparation our Farmers' Manual, Implement and Lawn Catalogues and will mail these also as issued.

## THE BEST NOVELTY SPENCER SWEET PEAS FOR 1915

- **BOADICEA.** A giant opal pink, delicately suffused pale cattleya mauve. The flowers are of great size and substance, and beautifully waved; a very strong grower, and always abundance of four bloom sprays. A gem for exhibition. (Very scarce.) Pkt. 30 cts.; 4 for \$1.00.
- BOBBIE'S FRILLED PINK. One of the most charming Sweet Peas ever raised. It is a Duplex form of Countess Spencer at its best. A distinct novelty, which will amply repay a little extra care. Pkt. 25 cts.; 5 for \$1.00.
- DON ALVAR. Grown side by side with all the best lavenders, Don Alvar was acknowledged by experts to be the best lavender yet seen. There is no difficulty in getting four and five flowered sprays. (Seed scarce.) Pkt. 30 cts.; 4 for \$1.00
- HELEN PIERCE SPENCER. Now fixed in true Spencer form. It is a most attractive flower and reminds one of a blue mottled Gloxinia. The ground color is white marbled and penciled with bright blue in thin lines on both wings and standard. The vines are vigorous and produce an abundance of strong stems, carrying invariably four large blossoms. Pkt. 25 cts.; 5 for \$1.00.
- JESSIE CUTHBERTSON SPENCER. Those growers who like a good stripe in their collection—and one or two are necessary in every collection—will welcome this grand addition. In the days of popular Grandifloras Jessie Cuthbertson was the favorite stripe, and our efforts to produce a Spencer form of this variety have now been rewarded with a fine large vigorous flower. The ground color is rich cream overlaid with stripes and marblings of bright rose pink. Both standard and wings are alike colored and the whole effect is bold and pretty. Pkt. 25 cts.; 5 for \$1.00.
- MARGARET ATLEE. This was a leading novelty last year and it has proved to be a great favorite. The color is warm salmon pink, perfectly suffused over a cream ground. The cream deepens into bright buff at base of standard and wings and this lights up the flower with great effect. The shade of pink found in Margaret Atlee is entirely a new shade and commands admiration. The flowers are of extraordinary size and many flowers measure two and one-half inches across the standard.

  This variety bears a large proportion of duplex

flowers, which greatly adds to its effectiveness.

Margaret Atlee gained a Certificate of Merit from
the American National Sweet Pea Society. Silver
Medal National Sweet Pea Society of Great Britain, July, 1914. Pkt. 25 cts.; 5 for \$1.00.

- MONTESUMA. This is considered to be a great improvement on Senator Spencer. The flowers are a more pleasing color, being striped with reddish maroon, the base of the standard showing a touch of orange; a good grower, producing four flowered sprays in abundance. Pkt. 30 cts.; 4 for \$1.00.
- NEW MARGARET MADISON. In New Margaret Madison we have a greatly improved strain of the popular lavender color found in our variety Margaret Madison. The size of the blossom has been almost doubled and the form of the flower is now all that could be wished for in a Spencer Sweet Pea.

The color, too, is daintier and prettier and is as near a true lavender as one could wish. The vines are very vigorous and the bold flowers are borne on long, stout stems and usually four blossoms to each stem. New Margaret Madison and New Miriam Beaver make a delightful soft color combination. Pkt. 25 cts.; 5 for \$1.00.

NEW MIRIAM BEAVER. Many and varied are the shades of pink in Sweet Peas, but in New Miriam Beaver we have an entirely new and distinct shade of pink. It is the daintiest and most pleasing shade of pink yet discovered in Sweet Peas. The color is hard to determine, but we think that a soft shell salmon pink on cream ground lightly overlaid with soft hydrangea pink would convey a good idea of its uniqueness.

The color is evenly distributed over both stand-

ard and wings and is very light and pretty.

The flowers are large, nicely waved—often duplexed—and beautifully placed on long stout stems. All other pinks look "heavy" beside this delightful shade. New Miriam Beaver will be the ladies' favorite wherever Sweet Peas are grown. Pkt. 25 cts.; 5 for \$1.00.

- NORVIC. This is one of the largest flowered and best strains of White Spencer Sweet Pea yet introduced. The blooms, which are of extraordinary size, are exceptionally well waved. It is quite fixed in character. Pkt. 20 cts.; 6 for \$1.00.
- ORANGEMAN. A very fine large-flowered variety of true Spencer form. Color a rich, deep orange, beautifully waved. A very strong grower and equally good for both exhibition and market. Pkt. 20 cts; 6 for \$1.00.
- ROBERT SYDENHAM. (Holmes.) One of the most individual colors introduced into the modern Sweet Pea. It is a bright orange salmon self-colored, rather lighter than the Stirling Stent and deeper than Melba or Barbara. It is of immense size and owing to its soft texture needs a little shading during the middle of the day. It is a grand acquisition and created a great sensation when exhibited at the Great Annual Exhibition in London. Pkt. 20 cts.; 6 for \$1.00.
- ROSINA. One of the largest Sweet Peas yet introduced. The standard and wings are a bright rosy heliotrope, with a distinct wire edge of solferino red on a cream ground, which is particularly effective and distinct from anything seen in Sweet Peas. On account of its pleasing and taking color, it has been greatly admired wherever exhibited, and is sure to be a very popular variety. Besides being such a vigorous grower, the flowers are of extraordinary size and well frilled of the true Spencer type, with abundance of four and five flowered sprays; will make a striking bunch for exhibition. Rosina was the leading novelty that helped to win the Silver Cup for new varieties at the National Sweet Pea Society 1913 Show. Pkt. 30 cts.; 4 for \$1.00.
- ROYAL PURPLE. This we consider the best Novelty seen last year. It was shown at the National and other Shows by Mr. R. Wright of Formby, and attracted a lot of attention on account of its fine royal purple color, great distinctness, and size. During 1914 it has more than maintained the high opinion we formed of it last year, and has been very generally admired. Awards of Merit, Royal Horticultural Society and National Sweet Pea Society, 1914. Pkt. 25 cts.; 5 for \$1.00.
- VEILED BRIDE. This is a charming novelty, and is now perfected and fixed. The ground color is white, daintily flaked and marbled with soft rose pink. The wings and standard are alike colored. The form of the flower is all that could be desired, the standard being nicely waved, round and bold. When a bunch of this variety is gathered one must call it "Sweet," the delicate markings of pink being daintiness itself. Pkt. 25 cts.; 5 for \$1.00.

## Ring Out the Old! Ring In the New!

Ring out the old, ring in the new— Ring, happy bells, across the snow; The year is going, let him go; Ring out the false, ring in the true.

Ring out, wild bells, to the wild sky,
The flying cloud, the frosty light;
The year is dying in the night—
Ring out, wild bells, and let him die.

Ring out the grief that saps the mind,
For those that here we see no more;
Ring out the feud of rich and poor,
Ring in redress for all mankind.

Ring out a slowly dying cause, And ancient forms of party strife; Ring in the nobler modes of life, With sweeter manners, purer laws.

Ring out the want, the care, the sin,
The faithless coldness of the times:
Ring out, ring out my mournful rhymes,
But ring the fuller minstrel in.

Ring out false pride in place and blood,
The civic slander and the spite:
Ring in the love of truth and right,
Ring in the common love of good.

Ring out old shapes of foul disease Ring out the narrowing lust of gold; Ring out the thousand wars of old, Ring in the thousand years of peace.

Ring in the valiant man and free,
The larger heart, the kindlier hand;
Ring out the darkness of the land,—
Ring in the Christ that is to be.

Alfred Tennyson.

## INCREASING POPULARITY OF THE RHODODENDRON.

In Europe and England the rhododendron has been grown for several centuries as an ornamental shrub, but its culture in America dates back little more than fifty years. For a long time the idea prevailed that the hybrid varieties could be grown successfully only within the narrow limits in the United States, and that rhododendrons were for the few rather than for the many. Happily this notion has been dispelled, writes Joseph H. Sperry in *The Country Gentleman*, but extensive plantings of the two hardy native species—maximum and Catawbiense—were begun no more than a decade ago.

Now the planting of this finest of the broad-leaved evergreens is yearly increasing. Together with finer appreciation of the beauty of its foliage and blooms has come more intimate knowledge of species, varieties and cultural requirements. Rhododendrons are an ornament either to cottage grounds or to the large estate, and can be grown successfully in different situations. After they are once established they are more enduring than almost any other shrub, and require less

attention.

Of the two American species of importance, Catawbiense grows in the high Alleghenies from Virginia to Georgia, bearing in June handsome lilac-purple flowers. Catawbiense, both for planting in its wild form and for use in producing hybrids, is the most valuable known species. It was introduced into England as early as 1785, and became common there by 1809. So hardy is it that it and also many of its hybrids can be grown as easily as lilacs. In beauty of foliage it excels almost any other evergreen, and in bloom it rivals many European hybrids.

The second valuable American species is maximum, often called Great Laurel and Rose Bay, which grows in the deep woods from Maine southward, and is very common in the Allegheny Mountains from New York to Georgia. Its flowers, which appear in July, vary in color from white to pink. The lateness of its blooming period, its remarkable hardiness and large, handsome foliage, all make maximum a very desirable species.

In America few rhododendrons were planted before 1855. Catawbiense and maximum were used to some small extent, set on well-kept lawns and in formal gardens where, on account of their loose manner of growth, they suffered much from comparison with the polished surroundings amid which they were growing.

Hybrids in these early plantings were used largely either as single specimens or in pairs. The mistake made in planting the native species, maximum and Catawbiense, was in not placing them in proper environments, and another error in setting both these and hybrids was that group and mass plantings, which show the shrubs to the best advantage, were apparently little used.

Here and there in Massachusetts and Connecticut, and States south of these, specimens of these early plantings may be seen. In the narrow north front dooryard of the James Stannard house, at Westbrook, Conn., a pair of these early planted rhododendrons may be seen, one on each side of the entrance gate, where they have been growing hard on to a half century, requiring very little care, just left undisturbed, producing every year a wealth of blooms, one of lilac purple, the other of blush white. In Saybrook, Conn., several immense rhododendrons are growing in the dooryard of the old Morgan house. On the north lawn of the Goldsmith place at Milford, Conn., well away from the house but shaded somewhat both by street and lawn

trees, are two rhododendrons evidently planted many years ago, differing much in size and shape, but one clearly being that very hardy, well-shaped, semi-dwarf variety Everestianum.

-Instances might be multiplied of these survivals of early plantings. They are valuable in that they suggest where we should plant rhododendrons on the home grounds in reference to buildings and trees, and also that we should plant groups rather than single specimens or pairs, though even this method is proper when the home grounds are very small.

Catawbiense may be put to any of the uses that are made of maximum, and may also be planted along with those hybrid varieties that bloom at the same time with it, not a few of which it equals in the beauty

of its flowers.

Hybrids may be used in the several ways in which the native species are planted, but are inferior to the natives for such uses, and, moreover, are somewhat expensive. Hardy hybrids are most enduring and effective when planted close to each other, and where they will be partly shaded either by trees or by buildings or barriers of some kind from the sun and wind, especially from the southern sun, which is particularly injurious in winter as well as in summer. Plant on any side of a building or in any angle of it except the south, but not in very close proximity to its side.

Both natives and hybrids flourish on western and northern slopes, and when well established need little protection even from winter winds. Where drives or paths on large grounds are outlined by shade trees on each side, rhododendron borders between the trees and

the drive give a fine effect.

Tall and dwarf rhododendrons may not be planted in the same group, the latter being used to great advantage in shaded rockeries, or amid dwarf evergreens.

To sum up, the ideal location for rhododendrons is where they will get a touch of the sun, morning and evening, and a glint of its rays at noon through the treetops or overhanging branches. Massing of rhododendrons, especially the native species, against a background of evergreen trees is very effective.

Rhododendrons will not live at all in a lime or chalk soil, nor will they drive in a clay soil, but will grow in any light, rich, sandy loam. If, however, an excavation is made to the depth of two feet and is filled in with leaf mold, peat, pine needles, leaves, stubble—in short, any decaying vegetable matter—mixed with rotted turf and sand, moisture will be conserved, better results will follow, more profuse blooms and greater permanency of the plants will be assured.

Rhododendrons must have moisture, for their roots are hairlike and do not penetrate deeply into the earth. A heavy watering at the roots, just before the blooming season and during droughts, benefits greatly. The plants should not be allowed to go into the winter dry at the

roots

The best hybrid rhododendrons are produced by layering; a slow process that makes the plants expensive. Next in excellence are English and American plants that have been produced by grafting hybrids low down on Catawbiense roots, a less expensive process giving quicker results and one chiefly used by English and American nurserymen.

In planting grafted rhododendrons set the plants low enough in the ground so that the point where the union is made between the graft and the root will be two inches below the surface. In a few years roots will grow out from the part of the graft beneath the soil, and what the nurserymen call an "own-root" plant will result, entirely independent of the root upon which it was grafted, and equal in value to a layered plant.

## Rare Shrubs for Decorative Planting

Apparently the most difficult part of planting is selecting what to plant. This phase of the subject has heretofore received scant attention, for few have realized how easy it is to give an air of individuality to the home grounds. The general public has been content to go on planting about a dozen different species of common shrubs, such as lilacs, syringas, spiraeas and the like when there is a much larger list to choose from and one that has every advantage on the side of beauty and decorative usefulness, writes Wm. N. Clute in American Botanist. To be sure, he says, the species commonly planted have the merit of being exceedingly hardy, very floriferous and almost sure to bloom annually, but many less known plants have all these characteristics. Even the

species commonly planted have relatives fully as beautiful and interesting. The Persian lilac, for instance, costs no more than the familiar shrub grandmother's garden and is a much more graceful and charmin: plant.

It is unlikely that any other spiraea will ever supplant the bridal wreath (Spiraca Vanhouttii) but its smaller relative, known as the snow garland (S. Thunbergii) deserves more frequent planting. It is one of the earliest of shrubs to bloom and its wand-like branches laden with small, white, star-shaped flowers is warrant enough for the common name.

About the time that the snow garland becomes conspicuous in the shrubberies, a little known relative of another common species comes into bloom. the cornelian cherry (Cornus mas) which as anyone familiar with generic names will perceive, is not a cherry at all, but one of the dogwoods. The red-stemmed dogwoods (Cornus stolonifera and C. sanguinea) are planted everywhere for the warm and pleasing effect of their red bark contrasted with snowbanks, but one who knows only these species would scarcely recognize the cornelian cherry as belonging to the group. All our native dogwoods have white or creamy flowers which open as the leaves unfold or after they are spread. The cornelian cherry, on the contrary, has bright yellow flowers which appear before the leaves. It forms a round headed shrub some ten feet high and, when covered with its clusters of flowers, is a most conspicuous object and one that adds much to the appearance of our borders at the beginning of the vernal season. Later in the year the flowers are followed by red, purple, or yellow fruits.

In spring, however, shrubs may usually be depended on to bloom. The great difficulty has always been to secure shrubs that will bloom after the first burst of spring has passed. Although summer flowering shrubs are rare in comparison with those that bloom earlier in the year, a number exist, and one who would give an air of individuality to his grounds should plant them. First in the list of this kind should be placed the rose of Sharon (Hibiscus syriacus) a well known plant of old fashioned gardens that deserves a place in all new ones. During July, August and part of September, it is literally covered with bell-shaped, blue, pink or white flowers that rather closely resemble the hollyhock.

The angelica tree (Aralia Chinensis) and the devil's

walking stick (A. spinosa)- are two members of the ginseng family that are easy to grow, curious in appearance and practically certain to produce great panicles of creamy-white flowers every August. These plants have few true branches, but they bear immense decompound leaves that have all the appearance of being such. In winter, when the great leaves have fallen, the stout, thorny have an odd appearance which no doubt accounts for at least one of the common names.

One species of tamarisk (Tamarix gallica) blooms in mid-summer. It has long slender branches thickly set

stems, stiffly erect,

HALESIA TETRAPTERA-SILVER BELL.

with tiny leaves like those of the cedar and the minute rosy flowers are borne in spikes along the branches. It is quite unlike other common plants and is most desirable for the contrasts it makes. It is a native of the rather dry and sterile parts of the Old World and will thrive even in poor soil. Another species, Tamarix parviflora, blooms earlier in the year and should not be selected if summer flowers are wanted.

A summer flowering Japanese tree that is coming into cultivation is the pagoda tree (Sophora Japonica). It bears long racemes of white flowers set off by the shining leathery leaves. The tree, itself, is shaped much like a well grown Persian lilac. The varnish tree (Kolreuteria paniculata) is another species that is not well known at present. It belongs to the soap-berry family and is therefore akin to the maples and horsechestnuts. It bears large panicles of bright yellow flowers at a season when flowering shrubs of any kind are desirable, and will doubtless become more common as its merits become known.

Equally rare in the Northern States, at least, is the

chaste tree (*Vitex agnus-castus*). In late summer it puts forth a profusion of violet purple flowers disposed in dense terminal racemes. The whole plant has an aromatic odor when bruised. Unfortunately the plant is doubtfully hardy north of the Ohio river, though it is said to thrive in parts of Pennsylvania and with some winter protection would doubtless endure the winters much farther north. The interesting nature of the shrub makes every effort to extend its range worth while.

Here, too, may be added a not very distant relative of the soap berry which is commonly known as the smoke

Courtesy Mechan's Garden Magazine, EXOCHORDA GRANDIFLORA PEARL BUSH,

tree. This is really a sumac (*Rhus cotinus*) though it has little resemblance to our common kinds. Its attractiveness lies in its clusters of fruit stems or pedicels. The plant rarely fruits, but after blooming the pedicels lengthen and branch and being covered with longish hairs make the whole bush appear as if enveloped in a nebulous haze of pale purple.

The witch hazel (Hamamelis Virginica) which can be dug in almost any thicket in the Northern States is undoubtedly the latest of all shrubs to bloom, but it is not the only autumn flowering shrub. The blue spiraea (Caryopteris mastacantha) does not begin to open its blossoms until September but it continues in bloom for a month or more. The plant is not a spiraea, being more nearly allied to the chaste tree. Its appearance, however, is much like a low spiraea, which accounts for the dealer's name for it. It is also known as Chinese beardwort.

This phase of the subject should not be left without some mention of the bush clover (Desmodium penduliflorum). It is neither a bush nor a clover, though it simulates both close enough to deserve its common name. In late September it is literally covered with racemes of pink pea-like flowers which make it very conspicuous. It dies to the ground in winter, though very shrub-like in appearance.

Coming back to shrubs that will give additional beauty to our shrubberies in spring, we find a wealth of material from which to choose, exclusive of the popular favorites. The pearl bush (Exochorda grandiflora) is an excellent species for varying the monotony of viburnums, syringas, and deutzias. As its common name indicates, the flowers are pearly white and are produced in abundance on the ends of the branches.

The globe flower (Kerria Japonica) with flowers like small yellow roses is an interesting addition to the border, not alone because of its flowers but also on account of its stems which are covered with green bark that gives a touch of vitality to the shrubbery even in winter. In autumn it frequently produces a second crop of flowers. Another species, which for want of a better name is known as the white kerria (Rhodotypos kerrioides) has rather larger white flowers that somewhat resemble those of the blackberry. The shrub forms a compact green head that even dry weather seems nearly powerless to injure.

The laburnum or golden chain (Cytissus laburnum) is better known in the Old World than it is here, but it is one of the most attractive of plants. At the blooming season it is thickly set with long drooping racemes of vellow flowers very much like those of the locust in size and shape. When in blossom, few shrubs are prettier. The fringe tree (Chionanthes Virginica) a near relative of the ash, olive, and privet is another attractive species with thick and shining entire leaves and a profusion of flowers with narrow drooping petals that make the common name unusually appropriate. The fringe tree is also related to our lilacs and golden bells (Forsythia) but the silver bell, though having flowers not unlike the Forsythia, is a member of the ebony family. To the same family belongs the storax with white bell-shaped flowers. There are two or three species of storax in our Southern States, but the plant most frequently found in cultivation is a species from Japan. Styrax Japonica.

#### GROWING BULBS UNDER GLASS.

BY MAURICE FULD.

The cold frame as a storing place forms the best connecting link when bulbs are grown under glass. When bulbs are brought in from the frame they are usually placed under the bench first to change the color of the foliage.

The heat must be gradually increased in order to pro-

duce the best flowers.

Conservatories permit the growing of many varieties of bulbs. My aim is to bring these forward and to mention any special features which are necessary to grow these bulbs to perfection.

To facilitate reference to them I give them here in

alphabetical order.

#### AMARYLLIS -- HIPPEASTRUM FAMILY.

Under this class one could collect perhaps several hundred varieties, but in nearly all seed books one can find the following sorts: A. Johnsoni, Prince of Orange, Vittata Hybrids, etc., etc.

It is very essential for the grower to make sure what class of Amaryllis he is growing, for otherwise he will soon be in trouble. If at all possible procure growing plants in pots, for then you are saving yourself a lot of trouble and you have the advantage of enjoying a prime flower the first winter or spring.

In the spring, after blooming, plunge the pots in the open ground, and water but sparingly, simply to keep them growing. The idea is to keep them in an inactive stage. About September 15 bring them to the conservatory, gradually increase watering and when the buds peep through between the leaves feed with liquid sheep manure.

They love a fairly warm and humid atmosphere and under those conditions produce their best flowers.

If dormant bulbs are secured they must be so potted that only part of the bulb is imbedded in the soil and fully one-half to two-thirds is exposed above the surface; such plants will not produce a perfect flower until the second winter. Keep them in growing condition all the time just as recommended for growing plants.

#### BULBOUS ANEMONES,

All the following classes, namely: Anemone Coronaria de caen and Anemone St. Brigid require a distinct culture, which can be applied to all alike. These Anemones are mostly grown for cut-flowers and will when more widely known become very popular. They are extremely cheerful and bright.

The bulb should be potted in September by planting several in a large bulbpan or a quantity in seedflats. They must be stored in cold frames, but must not be allowed to freeze. They should not be brought to the conservatory until about March 1 and even then they must always be grown cool. The temperature which suits the violet (about 50 degrees at night and 55 degrees in the daytime) suits these bulbs equally well. In fact, if a house is devoted to violets, the Anemones are best planted between them, where they will produce grand results.

But Anemones can be grown with equal success in cold frames entirely. The frame of course must be given up entirely to Anemones or be divided with Ranunculus and early Gladiolus, which require exactly the same treatment. Prepare the soil in the frame carefully and provide for perfect drainage. After they have been planted, place the sash over the frame. When freezing weather sets in cover the soil within with leaves right up to the sash and when the weather is extremely severe protect the frame further with mats and shutters.

About March 1 remove the leaves and on bright days between the hours of 10 and 3 open the sash to allow a free circulation of air. Just as soon as the growth com-

mences to appear above the soil, watering must be daily attended to and an application now and then of liquid sheep manure is excellent.

They usually begin to flower early in May and are at

their best during that month.

#### ANOMATHECA CRUENTA.

This is known as the Red Freesia, as it resembles the Freesia in growth, in foliage and flower.

It is never sold in dormant condition, but the plants are usually lifted from the ground while growing and shipped here in November. They are then potted, a number in a pot, and placed at once in a cool greenhouse, where they slowly grow and where they produce their bright scarlet flowers in March and April.

#### CALOCHORTUS.

Although growing wild in California, it requires glass culture in the East and North. The wonderful markings of the flower which resemble those of the better orchids should be an inducement for every flower lover to grow it. The bulbs arrive late and immediately on their arrival should be potted. In growth it resembles a Tulip, but is always weak in appearance. The bulbs after being potted should be stored in a cold frame, but must not be allowed to freeze. In February they are brought to the conservatory, where they can finally bloom in a temperature of 60 to 65 degrees.

#### CYPREPEDIUMS ACAULE.

This is our native or wild Lady's Slipper. The pips, which are usually collected in October or November, should be secured from your seedsman in frozen condition, gently thawed out, potted in a pan and started cool, and the heat can slowly but gradually be increased. Under favorable conditions the flowers should appear in five weeks. Directly after potting they are best placed under the bench, where they are excluded from the bright light. By planting them at intervals of a week there can be a succession of flowers for several months.

#### DARWIN TULIPS.

I have seen them in splendid condition, when gently forced in the conservatory. The potting and storing can be the same as for all regular tulips, but when they are brought in from the frame they must not be placed in excessive heat; in fact, they do much better when grown entirely at a moderate temperature, such as 55 to 60 degrees. Darwin Tulips look beautiful in pans and they furnish us the rare shades, including purple, mauve and wistaria.

#### GERBERA JAMESONI AND ITS HYBRIDS.

The Barberton Daisy, with its wonderful arrangement of petals and its long, massive stems, has become one of the most select winterflowers, and now that we can have them in almost every shade of the rainbow, it is bound to become a general favorite.

The flowers after being cut will invariably last from eight to ten days. In order to produce a crop of flowers during the winter the plants must have been dormant for four months previous to planting, which usually takes place in November and December. The best method to grow them is in a solid bench and not in pots. Start them at a fairly cool temperature and on the dry side, that is, water but sparingly until the first growth is through the ground; then gradually increase the heat and the supply of water. The first flowers usually appear towards the beginning of March and from that time on there is a constant succession until June.

#### GLADIOLUS NANUS.

The fairly small bulbs usually arrive from Europe towards the latter part of October, and they can be treated

in several ways: 1. If the conservatory has a department which is entirely devoted to Carnations these Gladiolus may be planted between them; they do not interfere in the growth of the Carnation and they like the temperature in which the Carnation is produced. 2. They may be potted or planted in flats and stored away in cold frames or protected pits until February and March and then brought under glass and gently forced. By the above two treatments they usually begin to flower about the latter part of April and are at their best in May. 3. They may be planted out into the cold frame and treated like Anemones and then the flowers are produced in June.

Among the newer introductions there are some splendidly colored sorts, particularly in shades of lavender

and pink.

Gladiolus Colvilli, which is usually classed among these, requires the exact same treatment.

#### LARGE FLOWERED GLADIOLUS.

In connection with this culture, three points must be religiously observed: 1. That the bulb to be used is of proper age, namely, that it has flowered at least two years previously under regular field culture and consequently is a fully matured and very large bulb of its kind. 2. That the bulb is thoroughly cured. This one point seems to have been more responsible for failures in the past than any other thing. Also the culture calls for planting in January. A Gladiolus bulb requires positively a rest of three months before it can be regrown for another crop of flowers; that would mean that the bulb has to be harvested not later than the end of September. Only bulbs that were planted in April, with the exception of a few quick flowering varieties, as, for instance, "Pink Beauty" and similar kinds are ready for lifting at that time. Even then the curing of the bulbs must be far more thorough than it usually is if the bulbs are stored for spring planting it may require the spreading of the bulbs on floors of storage rooms and artificial heat used to thoroughly dry them. 3. That only such varieties are used which are early bloomers, and which are known by past experience to flourish under this culture.

The following varieties may be recommended: "America," "Panama," "Pink Beauty," "Mrs. Frank Pendleton, Jr.," "Mrs. Francis King," "Halley," "Augusta," "May," "Peace," "Chicago White," "Brenchleyensis," "Princeps," "Governor Hanley," "Niagara." In under-glass culture the Gladiolus requires a cool temperature, and commercial growers usually grow them for economy's sake between Carnations, for the temperature which suits the Carnation

also suits the Gladiolus.

#### GLORIOSA.

Gloriosa is popularly known as the Climbing Lily of South Africa. In the conservatory it can be put to several uses: 1. To use as a climber over doorways or for a general greenhouse vine. 2. As a pot plant. The culture is the same in each case. The bulbs are dormant during late fall and are best procured at that time. When received place them on dry moss on the bench of the conservatory and watch for the white growth on one end of the bulb. Just as soon as this growth progresses it is time to plant them.

If grown either in pots or for a vine several should be planted, properly spaced, as a single bulb produces a very

lonesome effect.

Cover the bulbs not more than one inch and grow in a warm house. Growth is very rapid and the slender stalks must be tied to some support. The flowers appear, as a rule, within two months after planting and many of them are produced on a single stem.

#### LILIUM HARRISH.

The bulbs of these Lilies usually arrive early in August and should be promptly planted. Try and secure the largest possible bulb, for the larger the bulb, the surer your success. Fill the pot but half full with soil and set your bulb upon it, allowing no part of the top of the bulb to protrude. The top of the bulb should not be above the rim of the pot. The bulb must fit fairly snug in the pot. After potting, place the pot in a frame without the sash and cover lightly with straw; water carefully and regularly every day. It will take from four to five weeks for the bulb to make roots, but they make two sets of roots. In addition to the roots below the bulbs, they produce a set above the crown of the bulb and at the base of the main stalk; when these upper roots have progressed to two or three inches it is time to give the plant a larger pot, but great care must be taken not to disturb the roots

In the conservatory they should be grown fairly cool until you can feel the buds by touching the upper part. It is well now and then to dust sulphur between the leaves to keep the plants in healthy, clean condition. Watering must be religiously observed, but never must it be overdone, for too much water is just as injurious as not enough. When the buds can be felt they can be given more heat. A great deal depends upon when they are wanted in bloom. If they are desired for Easter, grow them steadily up to the time when the buds are almost fully developed. From now on they can either be retarded for a month by placing them in a rather cool and shady place or they can be forced to full bloom in a few weeks by increasing heat and light and water. A feeding with liquid sheep manure at regular intervals will improve foliage and flowers.

#### LILIUM LONGIFLORUM GIGANTEUM.

The bulbs arrive late in October and should be potted in the manner suggested for Lilium Harrisii, but must at once be placed in the conservatory under the bench. Being started so late they require more heat from the beginning, but otherwise they respond to all treatments as suggested for the Bermuda Lily.

#### LILIUM CANDIDUM.

Insist upon receiving bulbs grown in the northern part of France, for they are the only quality which should be used for growing under glass.

These bulbs arrive early in September and should promptly be potted, using Azalea pots and planting from

four to six bulbs in the proper size pot.

The pots are then plunged in the cold frame and when freezing weather sets in, they are covered with leaves and the sash. About January 15 they are taken to the conservatory, where they are gradually but gently forced. It is not always possible to regulate their blooming season for Easter, but even if they flower later, they are welcome.

#### LILIUM MYRIOPHYLLUM.

The bulbs can be procured in early fall and if treated like Lilium Giganteum, but forced only in cool houses, they produce splendid flowers.

#### LILIUM SPECIOSUM.

All the sorts of this class can readily be grown under glass for flowering in June.

The bulbs arrive in November and after being potted they are best stored for a couple of months in cold frames, where they must be well protected from frost by sashes and leaves.

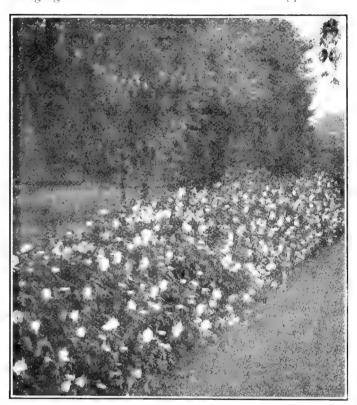

Heat must be gradual and gentle at first.

-From Growing Bulbs.

## Some of Our Popular Ornamental Hedges

The demand in hedge plants in this country is more for those of an ornamental character than for those used for defense, as in Europe, where the wonderful hedges of hawthorn excite the admiration of travelers year after year, writes a contributor to *The Florists'* Review. Honey locust, osage orange and cockspur thorn are the leading defensive hedge plants here, but none of them makes a first-class hedge, and all are more for agricultural than horticultural use.

We have, however, a good variety of ornamental hedge plants, both deciduous and evergreen. A neat hedge gives a finished and more attractive appearance

Context of Flort Relate
ALTHAEAS MAKES AN FULLCTIVE LATE SUMMER
FLOWERING HEDGE.

to any place, and the seclusion thus furnished adds to the charm of a garden. In this connection, it may be said that there is room for many times the number of hedges now to be seen. It is not good policy to plant the same type of hedge for all purposes. This only intensifies the monotony that is already too apparent in American gardens. It is sometimes better to suggest hedges which are a little out of the ordinary, which will give an air of distinction to the grounds of the owners using them.

While many people prefer hedges clipped square, a somewhat rounded top is to be recommended. The latter is ordinarily as handsome as the square top, and has the added advantage of shedding snow much better.

Foremost among deciduous hedge plants come the ligustrums, or pivet. The one most in demand is the California privet, L. ovalifolium. This is quick growing and makes a thick and handsome hedge in a short time. It cannot be used, however, in the colder states, where minimums of 5 to 20 degrees below zero are recorded, for under such conditions it will be cut down to the ground in winter. A much hardier and more

satisfactory variety, one which will withstand temperatures of 25 to 30 degrees below zero, is L. Ibota, the Japanese privet. L. Amurense, the Amoor River privet, is also quite hardy. As a general rule, plants eighteen to twenty-four inches high are the best for hedges. A zigzag row makes the thickest, densest hedge. Set the plants in a double row twelve inches apart. Privet hedges should be cut down quite hard the first year or two. This insures a thick bottom. The pruning should be done in spring, not in fall. Two clippings should be given during the growing season, one in June, the other in early August. Fall planting of privet is not recommended in the more northerly states.

Berberis Thunbergii, the Japanese barberry, makes a splendid hedge, one which is defensive in character as well as ornamental. It succeeds equally well if planted in either fall or spring. It may be trimmed into a formal hedge, like the privets, or allowed to grow naturally. Of course, the latter plan is the more pleasing where space will allow. If a thick, trimmed hedge is wanted, set the plants a foot apart; if natural growth is to be allowed, double that space. When the hedge is untrimmed, the fruits, which remain fresh all winter, give it an added charm.

The althwas, or roses of Sharon, are excellent for hedging purposes in case an effective late floral display is desired. Plants twenty-four to thirty-six inches high should be planted twenty-four inches apart. They require heading back well each fall to keep them within bounds, but must not be cut in sum-

CORRAGORATA AND THE REST OF THE AMERICAN ARBORATAR IS A POPULAR EVERGREEN HOOGE.

mer. The altheas suffer when the thermometer descends to 10 degrees below zero in winter.

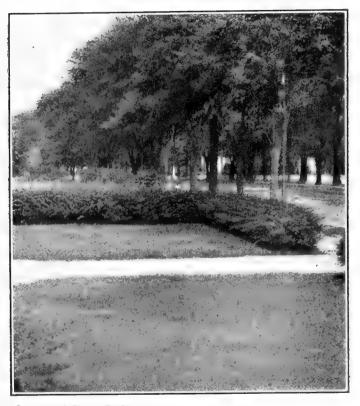

The crategus, or hawthorn, makes a wonderful hedge in England, where thousands of miles of it are to be seen. C. Oxyacantha is the kind best adapted for hedging. Plants twenty-four to thirty-six inches high

should be planted a foot apart for a close hedge, and the plants must be headed down to ten inches to insure a dense bottom. Unfortunately, hawthorns in America have many foes, such as borers, leaf-miners, scale, red spider, aphis, etc., and some bad fungoid affections. For this reason they will never become popular.

Deutzia Lemoinei makes a splendid hedge plant. Set out twenty-four inches apart and allowed to grow naturally, it soon makes a dense hedge and in May or early June, according to latitude, will each year be a mass of white flowers. D. gracilis also makes a fine hedge plant. It does not, of course, produce an imme-

diate effect, as in the case of privets.

A few other deciduous plants which can be used for hedging purposes are: Hydrangea paniculata grandiflora; this, of course, needs heading back well each winter; it makes a grand floral display in late summer. Fagus sylvatica, European beech, is useful if a tall hedge is desired. Rosa rugosa is also a strong grower, but it is not adapted to small grounds. Syringa vul-

Courtesy of Florist Review, BERBERIS THUNBERGI MAKES A SPLENDID HEDGE.

garis, lilac, makes a satisfactory hedge. Acacia, or honey locust, is good as a defensive hedge. Rhamnus cathartica, buckthorn, is good where a tall, strong hedge is desired. Philadelphus Lemoinci, the new French hybrid, is more moderate growing than the old P. coronarius and makes a splendid natural hedge, flowering profusely while small.

These do not at all exhaust the best of desirable hedge plants of a deciduous character. Various spiræas, viburnums, carpinus, stephanandras and others are

available.

Coming to evergreens, we find the list a much more restricted one. Probably the variety most in use is Thuya occidentalis, American arborvitæ. This makes a neat hedge, is hardy, withstands dry conditions well and is a quick grower. Objections to its use are that it turns a brownish color in winter, and no matter how well headed in it may be, it is thrown out of shape to some degree by heavy snows.

Picea excelsa, Norway spruce, makes a splendid thick hedge, one which can be closely cropped annually. I have seen hedges of this spruce in New England ten feet high and as much across, which are perfect pictures, grand windbreaks and afford shelter and nesting places for hundreds of birds. Set the Norway spruces twenty-four to thirty-six inches apart, according to size.

Tsuga Canadensis, or hemlock, when placed in a suitable position, one not too dry or windswept, makes easily the finest of all evergreen hedges, coming the nearest to the English yew of any of our North American evergreens. It suffers from dryness at the root more than other evergreens, but when it is given sufficient moisture, we have no evergreen equal to it. It

lasts longer than Norway spruce or arborvitæ.

A few other available hedge plants are: Buxus sempervirens, boxwood; useful as a bordering for flower beds, etc. Juniperus Virginica, common red cedar; I have seen excellent hedges made of this plant. Retinospora plumosa, Japanese cypress; this and its golden sport, aurea, make neat hedges. Euonymus Japonicus and E. Sieboldianus; these have handsome, dark green, shiny leaves, are erect in habit and make splendid hedges. Taxus cuspidata brevifolia, yew, and Taxus baccata, English yew; the last named succeeds moderately well near Philadelphia and at points south, but is not hardy farther north.

To make a success of hedges, the ground should be prepared in advance and turned over to a depth of two feet, deeper if possible, and two or three feet wide. Incorporate some thoroughly decayed manure with the soil. Be sure not to use any fresh manure. If planting cannot be done until spring, it is a great help to prepare the ground in the fall. Generally speaking, evergreens succeed better if planted in spring than in fall, but most deciduous plants do as well or better if planted in the fall, provided the work is not done too late and care is taken to firm the roots thoroughly. In the case of evergreens, it is especially necessary to keep the roots moist, not only at planting time, but through the season. Dryness at the root is accountable for more dead evergreens than winter's cold. Therefore, in the fall, when there is any likelihood of evergreens having dry roots, soak them thoroughly before the ground becomes sealed by frost.

## WOOD ASHES MAY FURNISH SOURCE OF POTASH.

If the European war should cause our large annual imports of potash to dwindle, many farmers will look to wood ashes among other substances to replenish the potash supply. Wood ashes are now a factor in Canada, besing considered a regular commercial commodity, and the large lumber mills and other plants using wood or sawdust for fuel in this country which at present make no use of the ashes from their furnaces or waste piles may find it profitable to store and sell them if the demand warrant it.

Besides the potash, ashes contain other ingredients which are of value to plants; namely, about 1 or 2 per cent. of phosphoric acid, a little magnesia and a great deal of lime.

Ashes from hardwoods (deciduous trees) are richer in both phosphorus and potash than those from pines and other softwoods (conifers). Ashes from oak, elm, maple and hickory have more potash than those from pine. The ashes of twigs (faggots, for example) are worth more for agricultural purposes than the ashes of heart-wood taken from the middle of an old tree. The smaller and younger the wood burned the better ashes.

#### FORCING GERMAN POTGROWN LILACS.

By John T. Scheepers.

In order to successfully force German potgrown Lilacs, and the German should be recommended before all other, it is necessary to know, that the various varieties require different treatment. To a large extent failure or unsatisfactory result can be traced to wrongful treatment and unsatisfactory choice of varieties for a certain purpose.

Quite frequently the first mistake is made in packing the plants; note the buds upon arrival and how the plants were packed; if too much material was used it is probable that the buds were smothered; there is no necessity for the use of great quantities of packing material, only the potball has to be protected against too severe changes in temperature.

Of all the many varieties for forcing there are only a very few that can be satisfactorily forced early, unless

"retarded" plants are used.

For earliest forcing the following are most satisfactory: Marie Legraye, single white; Charles X., single lilac; Hermann Eilers, single, rose with lilac; and Casimir Perier, double white; Marie Legraye is the best one of the lot.

For earliest forcing, allow the pots to get thoroughly frozen for from eight to 14 days, if necessary using the cold storage for this purpose; thereafter the plants must be slowly forced, at a temperature of about 77 degrees; give no more water than the plant can absorb but produce sufficient moisture through spraying, repeatedly done. As soon as the young sprouts are from 2 to 3 centimeters long (about one inch) raise the temperature to from 82-86 degrees, to reduce it again by about nine degrees by the time the plants commence to blossom. In that way the buds open slower and the flowers become larger; when in full bloom, take the plants into a house with a temperature of from 57 to 59 degrees, to harden them off.

The double varieties, with the exception of Madame Casimir Perier, should not be used for early forcing; for later forcing all existing varieties may be used; for such forcing an average temperature of from 64 to 68 degrees will be sufficient; for such forcing the plants will take from five to six weeks to blossom, but they will produce much more beautiful flowers.

For late forcing a very light and airy house should be used.

In forcing the following points should be most particularly observed:

1. The entire plants should have sufficient room, in

order that they may develop themselves evenly.

2. The plants should not be watered more than the plants need; the results due to overwatering are poor roots, resulting in unsatisfactory formation of flowers

and inferior coloring.

3. If special fine spikes are wanted, the blossombuds on each branch should be broken off, excepting the two strongest buds.

4. In case of foliage coming too strong, the young foliage should be early removed.

5. The colored varieties should be forced slowly, cool and with plenty of light, resulting in purer and more

pronounced shades.

Retarded Lilacs can be forced at any time; the first eight days they should be kept in half shade, later airy and light; treated in that manner it takes in summer from 3 to 4 weeks to bring them in full bloom; should they be wanted for Christmas flowering, they should be started at the latest the first of November, proper development being much slower at that time of the year.

#### THE VALUE OF TREES.

Trees being so indespensable to human welfare and comfort, it seems incredible that they should ever be allowed to suffer from neglect or that their wholesale destruction should be permitted. The man who plants a tree is a public benefactor, but he who protects and cares for trees already planted is no less deserving of praise and gratitude.

Every lover of trees should strive to create and foster public sentiment in the community in favor of tree planting and tree protection. Each town should have an organization devoted to arboriculture. In some states there are already such town organizations and the good results obtained are potent arguments in favor of a general

adoption of the plan.

The care of trees is not a matter of sentiment alone, but of dollars and cents as well. Did you ever stop to compute the value of a single full-grown tree? If it were destroyed tomorrow you could not replace it in your lifetime. It represents a century or more of growth. Perhaps it was planted by your forefathers, or perchance it was spared by the original settlers when the land was cleared. Reflect on these facts and let the reflection prompt you to tender, watchful care.

Trees breathe the same as animals. They inhale oxygen and exhale carbonic acid gas. The oxygen is taken in through their leaves and through the minute openings in the bark, called lenticels. This process of breathing goes on in the tree day and night, but assimila-

tion takes place only in the daylight.

Trees growing under favorable conditions frequently reach an age of several thousand years and attain enormous size. That the majority of trees die so young is in most cases due to the fact that they are subjected to unfavorable conditions. As examples of what trees may do when soil climate and surroundings are at their best, a dragon tree in the Canary Islands is said to be over 6,000 years old and a bald cyprus in Mexico over 4,000 years. An English oak and one of the redwood "big trees" in California are known to be over 2,000 years old. The eucalyptus in Australia attains a height of 470 feet and the redwood and douglass fir in California grow to a height of 300 feet or over. In the Eastern States it is not uncommon to see a sycamore or a tulip tree 150 feet high.

Of course, the age and size of trees depends much upon the variety. Some kinds of trees like poplars, willows and birches are comparatively short-lived, while oaks, white pines and the sycamore are naturally long-lived. All varieties of trees may have their lives greatly prolonged by proper care and those which seem doomed to death because of neglect may, in many cases, be restored to health and vigor by intelligent treatment. The removal of all dead or diseased wood, careful pruning, the filling of trank wounds with concrete, chaining or bolting to prevent the splitting of crotches, and the destruction of the insects that prey upon the foliage or infest the bark are the main features of the work of renovating trees.—Tree Talk.

#### AUTOMOBILES MAINTAIN RHODE ISLAND ROADS.

This year the motor vehicle roos, estimated at \$150,000 in prise the only funds rocked by the State of Rhode I had beered work. The State system comprises \$25,77 miles of water bound macadam and \$8.66 miles of bitunanaus macadam actor? of \$24.12 miles. All let the water bound mile dam have horse a been treated the year with esphaltic oil applied under proceed. The fact that Rhode Island is maintaining its state roads solely by means of rocked the information of the major and part which this great has ether of a system is taking in the road account.

#### SNAPDRAGON RUST.

During the summer of 1913 the attention of the floriculture department of the University of Illinois was first called to a rust on antirrhinum growing in the region north of Chicago, says a report on "The Rust on Antirrhinum," by Chas. C. Rees, Floricultural Pathologist, Argiculture Experiment Station, University of Illinois, Urbana, Ill. This rust, although it was thought at the time to be of little or no economic importance, has since, by virtue of its having spread into two other states, affecting seriously the snapdragon crops of a considerable number of growers, come to be regarded as a serious pest.

Prior to the summer of 1913, the rust had been reported but from two western coast states, California and Oregon. In 1895 it was determined as a new species by Holway, an American botanist, and named

Puccinia antirrhini (Diet, and Holw.).

Then in September, 1914, the writer learned that the snapdragons growing on a private estate in northern Ohio were suffering an attack of the disease. The report was substantiated by the receipt of a quantity of diseased material from that locality at the station

only a few days ago.

The disease is easily recognized and each grower of antirrhinum owes it to himself as well as to neighboring growers to examine his plants and cuttings thoroughly for any traces of infection. Within ten to thirteen days after a plant has been exposed to the rust, numerous grayish white areas the size of a pin's head will appear on the under sides of the lower leaves. From three to five days later characteristic rusty, brown pustules begin to replace these spots. These pustules continue to increase in number until practically every leaf of the plant is attacked. The stem also furnishes a foothold for the disease.

At this stage the plant begins to wilt; its period of usefulness has passed and in a short time it is dead.

Cuttings have also proved themselves to be quite susceptible to attacks of the disease. Taken at a time when their vitality is at its lowest point, the cuttings fall an easy prey to the rust. The disease appears on the cuttings as it does on the older plants, grayish white spots appearing first, followed by the rusty brown pustules. However, where the cuttings are taken from diseased plants in the field, the pustules may show up on the upper leaves as soon as they do on the lower ones. The reason for this is obvious, as the disease was already established on the plants in the field from which the cuttings were taken.

Owing to the fact that experimental work on the disease is just being commenced, the writer is unable at this time to advance any definite methods of control. However, after studying this problem for the last six weeks and after having observed the infection in a number of localities, it would seem advisable to

observe the following precautions:

Examine carefully the cuttings and plants growing in the house. Pay particular attention to the lower leaves of the older plants, as the heavy moisture on these leaves makes conditions ideal for the germination of rust spores. Remove at once and burn all plants showing the slightest signs of infection, keeping well in mind the description of the rust as given in this article. Diseased plants should be removed, roots and all, and burned with great care, as the spores will "fly" upon the slightest provocation, and in this way neighboring plants are infected.

As heavy moisture on the leaves makes germina-

tion easy for all rust spores, it would seem advisable to discontinue all overhead watering. Water only from below, and should the soil dry out too rapidly, mulch the bench well.

Do not propagate from a plant showing the slightest signs of the rust or from a plant that has in any way been exposed to the disease. The selection of cuttings from diseased plants has already played too active a part in the spread of the infection.

#### EXPERIENCE WITH THE RUST.

Referring to report on "The Rust on Antirrhinums," by Chas. C. Rees, Floricultural Pathologist, University of Illinois, Arthur Smith, Reading, Pa., submits the

following experiences:

"In the summer of 1913 I had a number of seedlings Antirrhinums growing in four-inch pots which were suddenly (apparently) attacked by a disease similar to that described in your article and which resulted in the majority of them dying. Although this was an entirely new experience, I did not attach the importance to it which it no doubt deserved.

"This year the same thing has happened, but the results have not been so destructive as the affected plants were removed, but not, as subsequent events have shown, before other plants had been infected for, since they have been benched, the rust has appeared upon many of them. I am, however, sanguine enough to venture to believe that I have got the disease practically under control by the following means:

"All plants badly affected, that is, with stems as well as leaves rusted, were turned out, the remainder had all diseased leaves removed and thoroughly sprayed with Fungine. The result is that the progress of the disease has practically been entirely stopped. Some plants have stems eighteen inches long with all leaves for six inches from the bottom destroyed, but the stems and remaining leaves are perfectly healthy, and others that were attacked are sending up healthy new shoots. I began spraying three weeks ago and have since sprayed all antirrhinum, those which have never shown any sign of rust as well as the others, twice a week, at the same time refraining as much as possible from overhead watering. In this latter connection, however, it has appeared to me that in the case of plants in pots out of doors as well as in the ground in 1913, the disease spread faster during hot dry weather than it did after the moister cool weather of autumn. This was especially noticeable with regard to plants in the ground which had had many of the lower leaves killed, but which recovered themselves and flowered well after rains in September. Strangely enough, this year not one plant from the same batch of seedlings planted in the ground has shown the slightest sign of

"The result of spraying has convinced me that the proper course to pursue for the future is to spray as a preventative before the disease appears and to keep it up throughout the season."

#### QUESTIONS SIMILARITY OF DISEASES.

Regarding Mr. Smith's communication, Chas. C. Rees writes: "I wish to say that if the diseased specimens of Antirrhinum which he sent to me are typical of his infection, then his plants are not suffering from an attack of the rust, Puccinia antirrhini. For this reason, I should say that his letter to you regarding control measures, etc., has no direct bearing on my article, as he is referring to a different disease of the Antirrhinum entirely."

## Work for the Month of January

By Henry Gibson

There is little that can be done outdoors at this time of the year, save it may be the trimming of such of the forest trees about the place as may need it. All cuts made on limbs of three inches in diameter and over should be painted over. When left unpainted they form excellent means of access for fungous diseases, which only too readily find means of entrance to the trees.

In localities where the weather conditions permit any planning and alterations that are deemed necessary may be carried out. Where manuring and digging of the vegetable garden has not been attended to, advantage should be taken of the first favorable opportunity of having the manure wheeled or carted on the ground, in readiness for spring digging.

#### SEED SOWING.

Some of the 1915 catalogues are now out, and ere these notes appear many more will be in the mail, which is a gentle reminder that with the advent of the New Year comes the time when definite plans for the year's garden must be formulated. It is never a difficult matter to form an approximate idea of the number of plants required for the summer bedding and the same remark applies to the quantity of seed required for the vegetable garden.

Among the many seeds which can be advantageously started now are: Aquilegias Delphinums, Petunias, Verbenas, Thunbergia, Shasta Daisy, Salvias, Solanums, Sweet Williams, Heliotropes, browalias, asparagus, Begonias, in variety, Glorinias, Tomatoes, Lettuce, etc.

#### Tuberous Begonias.

These begonias make useful subjects for conservatory decoration. A batch started up now will make fine plants by the end of April and on through May, when a display of the different shades of white, vellow, pink and red, will attract attention when ones employer comes from the city house to the country for the season. The tubers may either be started in the propagating bench, or they may be started in shallow flats on the bottom of which has been placed about two inches of sandy soil. On this plant the tubers close together and cover with just sufficient sifted loam to fill up the spaces between them. It is not even necessary to cover them if they are well shaded, for as they come into growth they should be potted into 3-inch pots. Bottom heat is an indispensable factor in starting tuberous begonias and if there is no room in the propagating bench place the flats on the hot water pipes. If kept fairly moist no trouble should be experienced in starting every one.

#### BEDDING BEGONIAS.

Among the list of seeds that may be sown this month is mentioned Begonia Erfordi, and those who use this plant extensively as a bedding should not overlook sowing the seed early. As a bedding this begonia is hard to surpass, its dense heavy growth is seldom affected by winds, it stands the dry heat of summer well, and flowers right through the season until cut down by the first heavy frost

Immediate effect is what is wanted when planting out, and by starting early first-class plants can be had in 4-inch pots, by the end of May, with which small stock cannot compare, no matter how thickly planted. Sow the seeds carefully in well drained pans of light sandy compost, and keep the little plants moving in a temperature of 60 degrees. They love heat and moisture, and a rich well-drained soil when potted.

Propagating.

From January onwards conditions are ideal for propagating purposes. The fires are maintaining a steady heat in the sand, and in most cases there is plenty of material to propagate from. Therefore every inch of space in the propagating bench should be kept filled until one has worked up a stock of what is needed. Where roses are to be propagated it is of the utmost importance that the bench and the sand be perfectly clean and in condition to receive the cuttings. Cleanliness is essential at all times, but nowhere more so than in the bench intended for propagating roses. Nearly everyone who propagates roses has his own particular idea as to the number of eyes a cutting should have. Personally, we think that for ordinary purposes three is sufficient, cut just below and just as close above the eves as can be done without injuring its vitality. When the cuttings are put into the sand care should be taken to point the leaves all one way and it will help considerably to prevent contracting some of the many diseases if the leaves are not allowed to touch the sand. There should be an air space between the leaves and the sand, and a good way of accomplishing this is to have small canes laid across so as to rest on the sides of the bench and the leaves allowed to rest on them. For beauty cuttings this device is especially valuable.

#### CARNATIONS.

Stock in a healthy growing condition is sending up strong flower stems at the base of which is plenty of material for the propagatory bench. Keep it going, as with roses, a clean bench, a clean sand and clean cuttings are the foundations of success. A bottom heat of about 56 degrees and the top heat that of a carnation house temperature is what is needed. A carnation does not want to lie a long time in the sand before it begins to root, or you may look for a sickly plant. Although the propagating is as important as anything, yet the care of the plant in the benches should not be overlooked. Carnations that have been flowering heavily right along will have exhausted the soil of its food supply, and feeding should be resorted to in order to keep the plants going.

Well decomposed cow manure is a good fertilizer to use. Next comes horse and sheep manure. Avoid heavy doses of either; frequent and light applications are best for the welfare of the plants. There will, however, be less danger of setting up a soft growth from an overdose of stimulants now that the longer and lighter days of the New Year are near than has been the case during the past two months. In the way of watering as the month advances they will need a little more than they required during the short, dark days of the fall. Do not, however, have them soaking wet, as this condition will soon finish the best of plants.

GERANIUMS.

The potting of the geraniums that are needed for bedding out should be pushed ahead. We find it is always better to do this early so as to give the plants a long season of growth. Any that are now in two-inch pots can be moved to threes, and then later on they can be transferred from threes to fours. A good growing medium for geraniums is two-thirds turfy loam and one-third of thoroughly decomposed manure and a five-inch pot of bone meal to each barrow-load of soil. If, after potting, they can be placed on a bench that has heating pipes beneath, so much the better as they enjoy a little warmth after a shift. A temperature of 65 degrees during the day and 45 to 50 degrees at night is sufficient.

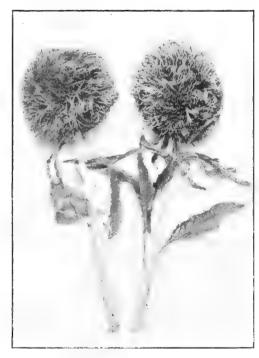

#### GARDENIAS.

The propagation of these subjects is only successful where a high degree of heat combined with a close and congenial atmosphere can be maintained.

A carefully attended propagation case comes nearest keeping the requirements. Cuttings require a bottom heat of 75 to 85 degrees, and a top heat of 10 degrees lower. Keep the sand moist and spray over head every morning. Shade and keep close until rooted. When they are well rooted pot them up using a compost of half leaf mold, half turfy loam, and some sharp sand. As they become established stand them on the bench of a sunny house with a night temperature of 65 degrees.

#### CELOSIA OR CHINESE "WOOL FLOWER."

This new Celosia Childsi, or Chinese wool flower, thrives under the same conditions that suit the common Cockscomb, and Celosia Plumosa. It is better to start the seed under glass about four weeks before the time for transplanting to the garden: If the little plants remain too long in pots they will begin to develop bloom, which may result in a stunted growth after they are planted out. Set plants no nearer than  $2 \times 3$  feet; at this distance they will cover the space completely and make a solid mass of color. The type is remarkably true and uniform, but it will mix with

CELOSIA CHILDSI.

Celosia Plumosa if grown near and the seed from such mixture will produce an inferior plant.

The seed was sent to John Lewis Childs from China four years ago. He has grown it for three seasons and has found it is as easy to cultivate in the garden as any of the Celosias. The blooms begin to develop in July, and continue to increase in size and numbers until killed by the frost; none of the blossoms fade until injured by cold weather. It grows about two feet high, branches freely; each plant shows twenty or more main heads of bloom, but every stem is full of laterals showing small bloom. It is a very shy seeder, some plants producing no seed at all, and others only a dozen or two. It is said to be one of the best and most showy all-round annual in cultivation. The color of the flower head is rich crimson, and the

measurement, the circumference of the flowers illustrated, was  $13\frac{1}{2}$  inches. The stems are half an inch thick.

#### A NEW SEEDLING EREMURUS.

BY W. H. WAITE.

The hybridist has been at work, and that he has been successful is easily seen. There are several hybrids already offered, e. g., Sir Michael, Shelford, Tubergeni Wallacei, and Waree. Wallacei is probably the best of all.

These noble plants should be more widely planted than they are, and good strong roots should be procured, as the results from small and cheap roots will be slow and disappointing. As soon as the hybrids become more widely known, they will be more in demand than the species, for they are more beautiful, more robust, and freer flowering. They also increase more rapidly, and thrive under conditions which are too trying for the earlier flowering varieties.

That they are perfectly hardy and can stand severe weather is borne out by the fact that one of the finest groups I have seen of these plants in this country was at Lake Forest, Ill., where the thermometer frequently goes down below zero.

#### CULTURAL NOTES ON ERICAS.

Ericas are as simple to grow as a geranium. They are a cool house subject in the winter months. I find a temperature of 45 minimum and 55 maximum ideal. The temperature of 55 is not so dangerous when the flowering commences. They are mostly all winter flowering. The most common variety in greenhouses is the variety Melanthera, which flowers at Christmas. This is a rapid grower. I found President Carnot a splendid variety for decorative work. As a house plant, it lasts well. It has long, tubular pink flowers. Other floriferous sorts are Persoluta Alba, Cavendishii and Wilmoriana. Ericas are becoming favorites for Christmas and Easter. After flowering is over by April, the spent flower should be trimmed off, the tips of growing shoots cut back and the plant kept in good shape. Any repotting should be done then. They generally improve with a shift from a 5-inch to a 6-inch pot. One pot larger is sufficient in all cases. Clean pots and good drainage are points not to be left out with hardwooded plants. The soil should be fine, to pack in firmly. Use loam and peat, equal parts, sand and fine charcoal. Pot very firm.

If plunged in ashes in the bench in the winter, it will protect the roots from being burned out. They are very fine and active next the pot. At the end of May remove the plants into a sunny aspect, not a half-shaded place. The summer treatment determines whether or not you will have flowers in winter. Plunge the pots to the rim in ashes in a place you are likely to come in contact with every day, as a weekly visit to these subjects is not sufficient. Attend to the supply of water for each pot as it dries out. A frequent spraying from a syringe or hose will keep them in good shape.

Allow the plants to stand out until the middle of October, or probably later. Cover them over on nights when a frost may come down suddenly. Do this rather than take them into the greenhouse too early.

In the fall they should be introduced into a very cool position. After Christmas give the plant more heat and pull out the flowers.—Canadian Florist,

Vol. XVIII.

DECEMBER, 1914.

No. 8.

Mankind is ready to acclaim Amen to the year about to pass into history, which has witnessed the beginning of the most unhumanitarian conflict for supremacy in the annals of the world's existence, the outcome of which, and its consequent disastrous results to the European nations, no one can foretell, though no one will contradict that it could not be worse.

In our own glorious country we have been sufferers from political misdeeds and an economic strife, but yet we have much to be thankful for. We have at times within the year been confronted with critical situations which threatened warfare, but conservatism has enabled us to extricate ourselves from these complications and to maintain our peace. As the new year approaches a wave of optimism over our immediate future outlook is casting pessimistic sentiment aside, and prosperity again looms up for our vast industrial enterprises. While our sympathies go out to our European brethren, with our wishes that peace for their countries is not far distant in the new year, we extend the season's greetings to our readers with a confidence that a general prosperity will overtake our nation during the year 1915.

"Freely you have received, freely give." The demands upon our people to aid in relieving humanity's sufferings caused by the European warfare have been great, and have been liberally responded to. But to take the bread from one to aid another is not charitable, nor is it right. The press is exploiting the doings of our wealthy classes in behalf of European charity, and much undeserved publicity is gained by some. We have an instance in mind where a wealthy estate owner has cut the wage of his laborers one-third because, as he says, the demands on him to aid the distress in Europe is such that he must reduce his expense elsewhere. He has been credited as a liberal contributor to several funds, but is it his money which he donates to this charity? A part, at least, is that of his working class which has become a sufferer as a cause of his liberality in another direction through withholding what they are rightfully entitled to for their hire. His offense is aggravated by the fact that his resources have not been affected by the war, but are being added to through his business enterprises, which are directly benefited by the demands of war. To such men we say—let your charity begin at home.

#### CO-OPERATION.

There is nothing new or untried in the broad principle of co-operation. In the last analysis, co-operation is only another name for civilization. As John Stuart Mill has said: "Almost all the advantages which man possesses above the inferior animals, arise from his power of acting in combination with his fellows, and of accomplishing by the united efforts of numbers what could not be accomplished by the detached efforts of individuals." From the dawn of history, men have co-operated to secure the benefits of safety, progress and justice, and have called that cooperation Government. They have united to produce the manifold necessities and luxuries of life and have called that co-operation Industry. They have talked together of the eternal mysteries, they have gathered together to worship the Supreme Being, and their name for this sacred co-operation is Religion. The greatest and most lasting undertakings of the human family have come in accordance with the Biblical injunctions, "Bear ye one another's burdens." "Ye are members one of another.

What has been accomplished through co-operation in other fields can be accomplished through co-operation in the field of agricultural reform. All that is needed is the intelligence to perceive the benefits to be derived, and the determination to secure these

Our fields are fertile, our people are the peers of any in intelligence and industry. And there is no better cause in which to struggle than the cause which has for its end the easing of the burdens which press upon the heavy laden. And those who are engaged in the good fight, who are dedicating their efforts to cooperation as the surest and wisest medium of economic progress, may well take for their motto the inspiring words of Edward Everitt Hale:

"Look up and not down, look out and not in, look forward and not back—and lend a hand."—Gov. Glynn,

New York.

### NATIONAL ASSOCIATION OF GARDENERS

W. H. WAITE, President, Yonkers, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

The annual convention of the National Association of Gardeners was held at Horticultural Hall, Philadelphia, on Wednesday, December 9, 1914. There was a good attendance of the membership, including gardeners and superintendents of large estates from different sections of the country.

The session opened with a business meeting at 2:40 o'clock p.m., when, following the reading of reports and the election of officers for the new year, an address was delivered and a paper read upon interesting topics, and an entertaining and instructive illustrated

lecture given on roses.

President W. H. Waite, of Yonkers, N. Y., presided. J. Otto Thilow, of Philadelphia, in welcoming the visitors said:

I am very much pleased to be delegated to welcome, on this occasion, a body not of tradesmen or mechanics, but of artists, of men who are the heads of the profession. Gentlemen, you represent a business which is one of the most beautiful, one which beautifies our homes, our cities and our land. Philadelphia has a natural right to receive you cordially because it is the leading horticultural city of this country. The first Botanic Garden is situated here, and the first essay on botany was written by John Bartram, of Philadelphia. We may not have the largest public park in the world, but we have 3.920 acres of parks in Philadelphia. In gardens we have some of the best private show places in the country. We are glad to have within our circle this afternoon men who are the leaders in horticulture and the managers of gardens which have always been known as exemplars among private places in this country.

I take special pleasure in welcoming the members of the National Gardeners' Association to Philadelphia because there is always so much here to be seen and appreciated by men directly interested in horticulture. It is my privilege, on behalf of those of your members who reside here and on behalf of the City of Brotherly Love, to bid you a hearty welcome and to assure you of the utmost freedom so that you may go about without restraint in acquiring information and go home refreshed in that

vocation in which you take such great interest.

I delight always in mingling with my brother florists, having been one of them all my life, because they are men of brawn and brain, men who take delight in their business. We have been told that if a man has no enthusiasm or love for his vocation his life will be a failure, and so will be his business. But we are glad to realize that that does not apply to us. The men who are employed directly in this vocation, even those who are in it indirectly, are men who have taken great enjoyment in it and who have been a blessing to us.

I will not burden you with any more words, but will place you at once in the hands of your President, who is here. emblem of his authority is the gavel, and you have always respected it as such. I take pleasure in presenting to the society today, through its President, a gavel which has a history.

(The speaker here presented the gift.)

The stem of this gavel is from the cedars of Lebanon that were brought to this country from Mt. Lebanon by a U. S. naval officer, N. B. Moody, in 1877. The piece of bronze in the end of the gavel (and which very often perhaps will be used to command your attention later) is a relic of the steamship Maine, which was destroyed in Havana Harbor, prior to the Spanish-American war. Now, as the material of this gavel was taken from those cedars of Lebanon, those trees which were felled by King Hiram for that wonderful temple and were transported overland from Joppa and became the support of that temple, so may the members of this association be the steady supporters of their President and of those who shall lead them hereafter in the maintenance of an organization which, in years to come, will be such that our land will be made beautiful by it. And when the sound of this gavel is heard, remember that the loyal men who went down in the Maine, from a cause we know not of, were faithful to their business; and so may you continue to be devoted to your profession, one which you appreciate and love and one which we

Mr. President, I place this gavel in your hands and leave it in charge of the association. (Applause.)

PRESIDENT WAITE expressed his appreciation of the gift and the thanks of the association to the donor.

MR. THILOW here added that he had forgotten to mention the important fact that the gavel was a present from Geo. W. Hess, superintendent of the Botanical Gardens at Washington, D. C. He thought it was entitled to additional respect as coming from the head of the chief institution in this country of the profession which the gardeners followed. (Applause.)

Subsequently the thanks of the association were voted to Mr. Hess for his beautiful gift; whereupon that gentleman came for-

ward and bowed his acknowledgments.

Routine business was then proceeded with.

The minutes of the last preceding annual meeting were read by Secretary M. C. Ebel, of Madison, N. J., and, on motion, duly seconded, were approved as read.

The minutes of the Executive Board meeting, in Boston, on

August 14, 1914, were read and, on motion, duly seconded, ap-

SECRETARY EBEL then read the annual report and financial statement of the Secretary, which follows.

#### SECRETARY'S REPORT.

The past year has been an active one within the National Association of Gardeners.

In pursuance with the By-Laws the follows directors were appointed by President Waite on January 1, 1914, to serve for three years: A. J. Smith, Lake Geneva, Wis.; Theodore Wirth, Minneappolis, Minn.; William Hertrick, San Gabriel, Cal.; Robert Bottomley, New Canaan, Conn.; Robert Angus, Tarrytown, N. Y.; Alexander Fraser, Newport, R. I.; Arthur Smith, Reading, Pa. To serve for two years to fill the unexpired term of John W Everett, elected vice-president, James MacMachan, Tuexdo Park

The first meeting of the Executive Board for the year was held on Thursday, January 8, 1914, in the Murray Hill Hotel, New

York City.

The subject of a closer co-operation between the National Association of Gardeners and the various local horticultural and garden societies was brought before this meeting, and your secretary was instructed to write to the different horticultural societies suggesting co-operation between the national association and the local societies in the interest of developing horticulture and advancing the profession of gardening in this country.

It was decided at this meeting to strictly enforce the clause of the By-Laws calling for the suspension of members in arrears of

dues for more than two years.

The spring meeting of the Executive Board was held in Horti-cultural Hall, Philadelphia, Pa., on Tuesday, April 7, 1914.

The revised By-Laws of the Association submitted by the By-Laws Committee, composed of John W. Everitt, M. C. Ebel and John F. Johnston, appointed at the 1913 convention, were approved by the Executive Board, and ordered printed in book form to be distributed among the members.

At this meeting the following resolution was adopted:

"The response to the communication on co-operation recently addressed to the local horticultural societies by the National Association of Gardeners has been so favorable it is the sense of the members of the Executive Board present that definite action should be taken to inaugurate the co-operative movement between the national association and the various local horticultural societies who may desire to unite with it to advance the interest of horticulture and the profession of gardening.
"Therefore, be it resolved, That the secretary be instructed to

address the various local societies, inviting those interested in our endeavor to appoint committees of three to be known as the Cooperative Committee of the local society of which they are appointed. These committees will act with the Co-operative Committee of the National Association of Gardeners, to be composed of the president, vice-president, treasurer and secretary of the National Association, and to be known as the National Co-oper-

ative Committee.

"The National Committee shall inform itself, through the local co-operative committee, of the workings and doings of the different local organizations, and gather such information as may be of interest and value to local horticultural bodies in their operations. and shall disseminate such information as it may acquire among the societies co-operating with it. Through such an interchange of views and experiences the successful efforts of local socities, in their various undertakings, will be imparted to sister societies, by

which they can benefit, and their scope of effective nork be increased.

"The National Committee is further empowered to enter into co-operation with beal horticultural societies in the broadest sense that the word 'co-operation' may imply, to spread the interest of horticulture and to decise ways and means by which the various local societies shall have actual representation at the annual conventions of the National Association of Gardeners where they may come together and work out the problems which confront the profession of gardening."

Arthur Smith, of Reading, Pa., submitted the following reso Intion:

"In view of the national character of our association, our president has rightly appointed to the Executive Board members residing in all parts of the country. At the same time it is obvious that the attendance of all members of whatever place meetings may be neld is practically an impossibility. As it is essential that every member of the Executive Board should take an active interest in the welfare of the association and should have opportunity of doing so afforded him to make suggestions in connection with, and offer opinions upon the policy of, the association; therebe it resolved, That an invitation be extended to members of the Boara, that when they cannot attend a meeting they submit an, suggestions they may have to offer in writing that can propcrly be brought before the meeting, and, that it shall be given the same consideration as though the member offering it were present in person."

Which was also adopted.

The summer meeting was held in Copley Square Hotel, Boston, Mass., on Wednesday morning, August 19, 1914. Only routing

business came before this session.

More their litteen hundred individual communications have been sent out by the secretary's offlee within the past year in relation to the Service Bureau and the co-operative movement, and in reply to general correspondence to the office. In addition, many circular letters were issued on the co-operative movement, directed to the various local societies and in the campaign for new member-

The Service Bureau has been successful in placing a number of members as superintendents, as gardeners and as assistants during the past year. The work this Burcau has so far accomplished is encouraging, and as it becomes better known will present greater opportunities to the members of the association. Through the co-operative morement it is planned to make the service of this

Bureau a far-reaching onc.

The recommendations of the Co-operative Committee, embodied in the report it is submitting, should receive the careful consideration of the convention. The success of the National Association depends on what it can do for its members. If the members. through their local societies, with which they are affiliated, will give their national organization the support it should have in the co-operative morement between the national and local societies it will accomplish much for the benefit of gardening and those who are associated with the profession.

M. C. EBEL, Secretary.

M. C. EBEL, Secretary.

JAMES STUART, Treasurer. Philadelphia, Pa., December 9, 1914.

We have completed our audit of the accounts of your treasurer up to December 8, 1914, and are pleased to report that we find the statements as rendered above to be correct.

WM. KLEINHEINZ JAMES MacMACHAN, ARTHUR SMITH. Auditing Committee.

On motion, duly seconded, the same was received and ordered to be filed.

THE PRESIDENT announced as the next order of busics reports of standing committees.

The only response was from the Committee on Co-operation, whose report vas read as follows,

Your Co-operative Committee, appointed to enlist the local horticultural societies in a national co-operative movement for the general uplift of gardening and to arouse a greater interest in horticulture, submits the following as its report of the year's work.

On April 10 the committee sent a communication to all horticultural societies and clubs having, to its knowledge, gardners enrolled in their membership and had the same published in the trade papers, inviting the local societies to co-operate with the national association in the proposed co-operative movement. Twenty-one societies responded favorably and one unfavorably. Favorable action was taken on the communication by other socicties, but the committee has as yet received no official notifications of such action, and those are not included in those reported as responding favorably.

Your committee being encouraged by the results of the communication inviting participation in the movement, is sued the following

bulletin on October 19:

"The National Co-operative Committee, appointed at the meeting of the National Association of Gardeners held in Philadelphia in April, 1914, to decise ways and means to make the proposed cooperative movement between the National Association and local gardeners' clubs and societies operative, submits to the local cooperative committees, appointed to work in conjunction with the National Co-operative Committee, the prime objects of the movement, which are as follows:

To establish gard ning as a profession on a more firm tounda-

tion in America.

To develop a closer fraternity between those engaged in the

profession of gardening and those interested in it.

To make known that the vocation of gardening is not acquired through one or two seasons of work in the garden, but through a thorough training—which demands both a practical and scientific knowledge gained only through years of study.

To provide an educational course whereby those ambitious to gain a general knowledge of the different departments of their profession, and not in circumstances to secure it at college, may

obtain it through their national association.

To make the Service Bureau of the National Association of Gardeners an institution to which those requiring the service of gardeners in their various capacities will turn with confidence for their requirements.

To encourage an exchange of views and the disseminating of reports of the doings and activities of the various local societies, whereby the experience of one society may aid in the development

of the other societies.

To bring about more uniform conditions to govern flower shows, through the adoption of rules and regulations and an official scale of points for judging flowers, fruits and regetables by the various horticultural societies, which could be applied to all shows conducted by clubs and societies participating in the cooperative movement.

To arouse the interest of estate owners and others interested in gardening in the activities of the local societies and the

national association.

"The foregoing are a few suggestions of what the plan contemplates. The National Committee recommends that the local committees submit these suggestions as a subject for general discussion at a meeting of their society, with a rick of bringing out some thoughts which may aid the cause. It especially solicits suggestions and epressions of sentiment respecting the proposed establishment of flower shows on a uniform basis by the adoption of standard rules and regulations and a schedule of points for judging to govern them.

"It seeks advice on the establishing of an educational department for the benefit of those who may want to avail themselves of study courses, and suggestions on how the Service Bureau may be conducted to provide opportunities for the many rather than the few. It should be national in scope, yet local in operation, in that the local societies shall have a roice in the filling of positions in their

communities.

"The National Committee asks that the local co-operative committees report to it any recommendations their societies may have to offer; also any suggestions the local committees may deem will

further the movement."

Through reports in the press, and through other indirect sources, your committee has learned that this bulletin was received with favor at meetings to which it was presented; but your committee has not been generally aided through the local co-operative committees with criticisms or suggestions to present to the convention.

Among the recommendations offered in answer to Bulletin No. 1 are:

The printing in leaflet form of the aims and objects of the N. A. G. for distribution among local societies, so that those who are not yet members of the national association may acquire an understanding of its purposes.

That the local societies submit their present rules and regulations, together with their scale of points for judging at flower shows, to the National Co-operative Committee from which the said committee shall draw up a standard set of rules and regulations and scale of points, which shall be adopted by all the societies.

That the National Association of Gardeners, through working in conjunction with State Agricultural Colleges, obtain from them the scientific instructions necessary to supply to correspondence classes, and a fee charged for the maintenance of the

classes to members enrolling in them.

That the co-operative movement be extended to the national and local garden clubs, a large number of whose members are estate owners, to establish a closer fraternity between those engaged in the profession of gardening and those interested in it. Your committee submits as its opinion that cooperation of a national scope between our organization and the local horticultural societies can be successfully established, providing the support it is entitled to will be forthcoming from the local co-operative committees, which must manitest both interest and activity in the cause. In this connection we quote a famous economist on behalf of co-operation, "Let the work be parceled out with the genius that you, who know the value of organization, of co-operation, in the management of your own affairs, have proved you possess. See that the wisest and ablest men of your organization are placed in the executive positions. Make of yourselves such carnest and ablo lieutenants that the detail of organization may be complete and effective. Understand fully that this means self-socrificing service; that it recans expenditure of time and that it means co-operative effort."

W. H. WAITE. J. W. EVERITT, JAMES STUART, M. C. EBEL.

On motion, duly seconded, the report was received and ordered to be filed.

Communications were read by Secretary Ebel, inviting the association to hold its next annual meeting in certain cities, and also from local growing establishments and norseries about Philadelphia, extending hospitalities.

On motion, duly seconded, the invitations were received and

ordered to be acknowledged.

THE PRESIDENT announced as the next business the election of officers for the ensuing year.

W. R. Pierson, Wm. Sperling and J. Collins were appointed by

the Chair as tellers in the election.

Nominations were made, but one candidate being named for each office. Pursuant to the instructions of the convention, the Secretary cast one ballot for each candidate named. The result of the election was reported as follows: President, W. J. Everitt, Glen Cove, N. Y.; Vice-President, W. S. Rennie, San Francisco, Cal.; Secretary, Martin C. Ebel, Madison, N. J.; Treasurer, Jas. Stuart, Mamaroneck, N. Y.

The convention proceeded to elect trustees for the ensuing year. Nominations were made and a ballot taken, the following being elected: Trustees Wm. Kleinheinz, Ogontz, Pa.: Peter Duff, Orange, N. J.; Geo, W. Hess, Washington, D. C.; Wm. Turner, Mendham, N. J.; John H. Dodds, Wyncote, Pa.

Under the order of new business, John Johnson, of Glen Cove, Y., urged the propriety of providing for the appointment of State Vice-Presidents. He said he thought that such officials would help to enlarge the ranks of the membership and disseminate interest in the association, especially in the West.

SECRETARY EBEL intimated that the effect of this might be to supersede the directors, and explained that the proposition would require an amendment to the by-laws

MR. JOHNSON said be anticipated that the amendment would be necessary, and that, if advisable, it could be made at the next annual meeting.

PRESIDENT WATCE remarked that he regarded the proposition as properly one for consideration by the Executive Board.

MR. JOHNSON gave notice that he will offer a resolution for an amendment of the by-laws at the next meeting.

PRESIDENT WAITE, having completed the regular order of business, invited discussion upon general topics. He then called on Mr. Therkildson.

MR. W. F. THERKILDSON, Philadelphia, responded. He said in part:

"Mr. President and Gentlemen: I open by saying that you came very near hearing from one who has done something in the horticultural or agricultural world. In calling upon me the other day. Mr. Ebel came to a sort of 'fill in' man, because another, Mr. W. Atlee Burpee, could not be secured by reason of previous en-When I came down here Mr. Ebel assigned to me the gagements. subject of 'The Progress of Horticulture in America'; but as I looked around this audience and saw the faces of the representative men who are here it dawned upon me that Mr. Ebel had not only perpetrated a joke, but inflicted a hardship upon me. I asked him how long I would be expected to talk, and he said, 'Suit yourself about that; some speakers are liked the longer they

talk; others, the sooner they finish,' No doubt you will feel

relieved when I finish. (Merrument.)
"With the President's permission, I venture to broaden the subject a little to that of the progress of horticulture, agriculture and the allied industries; because, according to the technical definition of it, horticulture is confined to a knowledge of trees, shrubs, etc.; and the progress of horticulture in America has not been as rapid as it might have been; in other words, the progress of some of the other associated industries, for instance, the great nurseries, has been far more rapid.

"In reflecting upon how to broaden the subject of the advance of horticulture I felt anxious to learn something of the popular notion of horticulture, or what it was commonly understood to mean. With that idea in mind, the other day, I called in one of my assistants whose business it is to file all the publications that come in, and, addressing her by name, abruptly asked 'What is horticulture?' Instead of giving a definite answer she ex-claimed, 'Why, Mr, Therkildson, is it possible you don't know what horticulture is? Horticulture is a paper published in Bos-(Merriment)

"Assuming that I have the privilege of broadening the subject, I will say that the progress of horticulture, agriculture and the allied industries has been very rapid in America, more rapid than that of any other industries in the world. It has been said, and no doubt with truth, for I do not know that the statement has been controverted, that America leads the world in commercial growing under glass. I assume that that is a fact that will not be disputed, but I am not so well qualified to speak of it from personal knowledge as I am to speak of seed growing, although I was associated with the world's greatest combined nurseries for

"My early days were spent on a greenhouse and nursery place of minor importance in southern Ohio. My father came to this country from Denmark with a knowledge of horticulture gained by experience—a practical, not a technical knowledge—and was first employed by one of the largest nursery organizations in Ohio. Later he went into business for himself in a small way. My earliest recollections are of greenhouses and nurseries. I had, as I have said, a hardy Norseman for a father, who knew no pleasure except in his work, who got a dollar and kept it, who never thought of making a dollar earn a dollar; and in those days flower pots were not so easily or cheaply gotten. As a small boy flower pot washing was the bane of my existence. As I have mentioned, we had a small greenhouse range of some twenty to twenty-five thousand feet of glass, and I insist that it seems we had more flower pots than the balance of all the nursery concerns combined. I do not know that any of you have undergone that experience, perhaps many of you have. After a few years, as I grew larger and stronger, I was given a position in winding after the budders. I became a winder. Perhaps some of you have done that. I was very hard work. envious of the man who wielded a knife. After a time I had experience enough to use a budding knife. I was very proud of it. When I went out the first time I butchered many thousands of roses and trees, but finally acquired the art, became proficient and got a place where I could bud from three to four thousand a day on an average. I feel that this experience enables me to speak without any guesswork, and gives me a right to judge in a way of the progress of horticulture and agriculture. My home place was a combined nursery and greenhouse. We also sold some market gardening and did everything to keep going.

thousand miles and lifted countless tons of earth. "I remember well when a place that had twenty-five thousand feet of glass was a big place commercially. Today such places are not counted in figures of square feet, but in acres of glass and, with their large complement of men and equipment, are nothing short of marvelous.

raised a little celery. We had no modern celery tiller at that

time, and I had the pleasure of raking it up by hand. I believe

that I have crawled along celery rows to the distance of several

"I gathered from my conversation with Mr. Ebel that what I would say here was to be regarded as, in a way, a talk to private gardeners, but I am going to indulge in a little more latitude for my remarks. When one considers the size of these indestries statisties do not mean much, because we speak of a million as glibly as we speak of a thousand feet. Few have any conception of what a million really is; but when we come to the nursery and speak of millions, two or three or, in some instances, four or five millions, as there are in some of the nurseries today. the amount of work which those figures may be taken to represent is so enormous that it is not readily apparent. I mention, by way of illustration, one nursery concern with which I was connected for several years, and which has a reputation of being the largest combined nursery in the world. That particular concern has some twenty-two hundred and fifty acres in active cultivation. I mean by active cultivation in continuous rotation crops. The firm owns in pieces, in widely separate pieces, several thousand acres of land. One of its organizations is said to have 255 miles of tile drainage. This tile drainage system is blueprinted and platted, so that stoppage may be locked without any trouble. Few people even in the trade have an adequate conception of the magnitude of this particular concern. For instance, peach pit seeds that we used for planting were not bought in bushels; they were bought in car loads. At one time several car loads of North Carolina and South Carolina peach pits were brought in, and one car load was kept for sale to small nurseries throughout the country. On that particular nursery quite a number of reach pit planting machines are employed. Those a number of peach pit planting machines are employed. machines operate in a way similar to potato planters. The peach pits are screened and assorted to size to fit the machine without stopping it, and the resultant growth of the seed evidences the accuracy of the work of the machine, the same being most regular and at almost equally divided intervals. On this nursery there were budded some seven hundred and fifty thousand roses. At the time I was connected with it there were thirty-five acres of own root stuff with pears, apples and plums running into hundreds of acres and ornamentals occupying immense areas.

"In the East we have other nurseries of more or less different character. There is located near Philadelphia one of the largest

organizations of its kind in the world.

'Colossal nursery industries are not confined to any one section. In the far South there are enormous areas devoted to nursery culture. In Louisiana and Missouri, we have the great nurseries. In Iowa, we have several large concerns. Around Rochester and Danville, N. Y., are big organizations. In North Carolina we have a famous nursery. In Connecticut there are big nurseries, and right around Philadelphia we have several of the foremost nurseries in America. Around Gulfport, Biloxi and Bay St. Louis, near Mobile and in southern Mississippi the radish industry is immense, one grower having fifteen acres in continuous cultivation in radishes. They are put in by seed drills, cultivated by hand, by wheel holes dug with a Platt Junior onion digger, and are rapidly washed by means of a large cement tank in which is a revolving brush. The radishes are held up against the brush and cleansed. They are then put on a table, bunched and packed in barrels or boxes for the Southern market. A long radish is required for the Southern markets, that being the more popular in the South. For the Northern market the round types are grown. The effort in out-door growing in various sections of the country, in the vegetable industry particularly, is simply stupendous. One organization near Medina, Ohio, estimates that the return from their product in onions and celery, this year, will reach the enormous sum of one million dollars. This organization is known as a commercial celery concern.

"The seed industry in this country has grown to immense proportions. There was a time when Peter Henderson and Dreer were, to use a common phrase, 'all there were to it' in the United States. Numerous concerns have come into the field, and today the quantity of seeds handled daily in the trade is so immense as to be almost beyond competition. Having given many years of my life to the seed business, I claim to have some familiarity with it. As it is commonly defined, the business embraces the handling of bulbs and in some instances even tree seeds. Philadelphia might be termed the headquarters of the industry in this country, but the distinction would be due rather to the number of firms engaged in the business here than to the size of any one concern. In the Northwest there are great establishments, of which we hear little, that do individually more business than was done by all the seed concerns in the entire East twenty-five

years ago.

"When visiting a Canadian concern, not long ago, I was told that they had there about two million pounds of turnip seed in I also saw there in storage tremendous quantities of storage. bect and other varieties of seed. This concern occupies some twelve or fifteen acres of floor space in buildings of most modern and uniform construction. I was teld on good authority, and have reason to believe it, that the concern's investment in commission boxes runs into millions of dollars. That may not be an accurate estimate, but I do know that they have their own box commission plant, printing and lithographing facilities in order that their output in books, boxes and lithographs may be under their own control.

"I have heard it said that in California three thousand acres

are devoted to the growing of sweet peas alone.

"Nowadays the woman who comes to a nursery concern knows exactly what she wants. Women's clubs and garden clubs have done much to educate a woman not only as to what she wants but as to the correct nomenclature and characteristics of the varieties desired. You are no longer dealing with a person who does not know what she wants. So I say that the gardener, to be of real value, must continually strive to improve his knowledge and his service; and with this improvement will come the proper remuneration. The lack of knowledge on the part of people who are procurable to do the actual work of gardening is doing more perhaps to prevent the growth and progress of horticulture in America than anything else. There are many men who are properly equipped for it, but that does no credit to America. It is a curious fact that all the effort of real value that has been made in America has been made, as a rule, by men who were trained in Europe and who learned their work under the proper conditions and in the thorough manner in which they were trained up. We have some notable instances of great financial success, in business in general, among men who were raised and reared under American conditions; but our lack of doing things thoroughly is responsible perhaps for the lack of advancement in horticulture and agriculture in this country

"I might talk all the afternoon upon the growth of agriculture. I am more familiar with that topic than with motor plowing, soil formation, chemical fertilization, etc. Those subjects may be dwelt upon for hours. But I want, from my viewpoint, to advise that men who equip themselves for service as gardeners make an effort to know all that is possible in the profession of gardening. Some men may know gardening, some know motors, some know golf links, some know tree surgery, some know strains, some are entomologists and what not; but the gardener, to be perfectly equipped, must know much of each of these.

"As a last thought I wish to quote the expression of some great man who has said: 'We do what we are on account of impulses given us by previous training, previous acts or conditions, under which we live and have lived.' So I advise: Know what you want to do, hold that thought firmly and do each day what should be done; and every sunset will see you that much nearer the goal, whether it be in gardening or any other profession. I thank you for your attention." (Long continued applause.)

On motion, the thanks of the association were voted to Mr.

Therkildson for his interesting address.

The next business was the reading of a paper prepared by Mr. Richard Vincent, Jr., of Whitemarsh, Md., on "The Gardener of the Past and the Future."

The paper was read by Secretary Ebel and listened to with much interest. (This paper is published in another column of this issue.)

On motion, duly seconded, a vote of thanks was tendered Mr. Vincent for his paper.

The last session of the afternoon convention was in the nature of an instructive entertainment when Robert Pyle, president of The Conard & Jones Company, delivered his lecture on "Roses at Home and Abroad" The illustrations of some of our best roses, and most noteworthy rose gardens in this country and Europe, were for the most part in color, and contained many suggestive ideas with reference to layout, arrangement, etc.

First of all, Mr. Pyle described the Rose Festival Week of Portland, Ore., picturing first the luxuriance of roses with which even the streets there are beautified, and then showing the parades and automobiles, hores-drawn vehicles, children, etc., to which the entire week is given over, with views of rose gardens down through California, and then East throughout New England. Mr. Pyle took his audience to the rose growers of England, where he had visited the nurseries of Wm. Paul & Sons, of Waltham Cross; of Hugh Dickson, of Belfast, Ireland, and Alexander Dickson, of Newtonards; of S. McGredy & Sons, of Portadown, Ireland. He then described the great popularity of flower shows and rose shows in England, showing an attendance of no less than 2.000 people ten minutes after the opening hour on the day when the admission price was one guinea (over \$5 apiece).

Then crossing the English Channel to France he described the International Rose Show, where judges meet from all the nations in the Bagatelle Rose Garden, belonging to the city of Paris. in a park that is now overrun with sheep, or was, in expectation of the siege of that city; then through the nurseries of France. especially those devoted to rose growing in Orleans, including the Levavasseurs, Barbiers, Benards and others; to the Lyon, famous for the roses of Pernet-Ducher, whose work in originat ing such roses as Sunburst, Willowmere, and many others with which we are familiar, was applauded. Hence, down the Rhine through Germany, into Luxenbourg, among the great growers of that country, and later he described in detail with colored illustrations the beautiful garden of Monsieur Gravereaux, the Roseraie de L'Hay, near Paris, with something like 6,000 different varieties, and five to six acres devoted to the rose in the greatest variety of arrangement.

Mr. Pyle then brought his hearers back to America, described the success of the garden in Elizabeth Park, at Hartford, Conn., and the popularity which led no less than 35,000 people of Hartford and the surrounding country to visit on one Sunday this wonderful garden, the roses of which cover no more than one

With this as an example, and telling about the work which they have already launched, he described the efforts being made by the American Rose Society, who are now establishing an experimental rose garden in connection with the Department of Agriculture, at Washington, D. C., and Cornell University, and also with the Minneapolis Park Board, where all varieties can be tested and compared, and results distributed by bulletins to the people of the country. Mr. Pyle claimed that work of this kind, making it possible for the average citizen to see what can be done with roses, would send thousands of them home to do likewise in their own gardens, and would arouse the interest in this flower to an extent little as yet appreciated. He concluded with an appeal that his hearers should join in and support the work of the American Rose Society.

A vote of thanks to the lecturer was tendered amid applause.

The annual banquet of the association was held on Wednesday evening in Horticultural Hall, about one hundred members and friends, which included a number of ladies, attending. The banquet hall was beautifully decorated with plants and cut flowers, the work of the local Committee on Arrangements—Messrs, Logan, Kleinheinz, Dodds and Rust. One of Philadelphia's wellknown caterers supplied the menu, which was an excellent one, and every one appeared well satisfied with the manner in which the inner man was provided for.

At the conclusion of the dinner President Waite introduced J. Otto Thilow as toastmaster. Mr. Thilow proved himself an able master of ceremonies. President-elect John W. Everitt was called on to respond to the toast "The National Association of Gardeners"; then followed Robert Craig to the toast "Our Horticulturists"; James MacMachan, "Our Retiring President"; Wallace R. Pierson, "The American Rose Society"; William Kleinheinz, "The Chrysanthemum Society of America"; S. Mendelson Meehan, "The Nurserymen"; Richard Vincent, Jr., "Different Herbard, The Naiserymen; Michael Vincent, J., Different Kinds of Compensation"; John Westcott, "The Florist": Paul Huchner, "The Railroad Gardener"; Henry Michell, "The Seedsmen"; Arthur Smith, "The Ladies"; Charles Seybold, "The Gardener's Influence in a Community"; George C. Watson, "The Human Side of the Gardener."

W. J. Collins provided entertainment during the evening by rendering some old Scotch airs. Dr. P. H. Lane and Robert Chaig also entertained the diners with a duet which brought forth much amusement

Those who have been present at the former banquets of the association voted the Philadelphia event one of the most successful ever held.

Greetings were received and read from the following: President Theodore Wirth, Minneapolis, Minn.; President-elect Patrick Welch, Boston, Mass.; Secretary John Young, New York, N. Y., of the Society of American Florists; Charles H. Totty, Madison, N. J.; William F. Gude, Washington, D. C.; J. K. M. L. Farquhar, Boston, Mass.; Frank R. Pierson, Tarrytown, N. Y.; William J. Stewart, Boston, Mass.; J. Austin Shaw, Brooklyn, N. Y.

On Thursday morning the members assembled in the club rooms of the Philadelphia Florists' Club for the bowling tournament, the contest lasting throughout the forenoon. John W. Everitt won President Waite's prize for the highest score. The ten high scores for which prizes were awarded were as follows: John W. Everitt, 167, 191, 180; John H. Dodds, 210, 148, 177; William Robertson, 178, 176, 151; Samuel Batchelor, 171, 154, 179; Charles Seybold, 179, 167, 132; James Stuart, 157, 142, 154; Thomas Aitchison, 151, 118, 168; John F. Johnston, 147, 123, 161; Joseph Manda, 145, 122, 144; L. Ottman, 122, 140, 103.

Thursday afternoon some of the visiting members journeyed to the P. A. B. Widener, John Wanamaker and the Clement B. Newbold estates. Others visited the Dreer Nurseries. Riverton, N. J.: the Andorra Nurseries, Chestnut Hill, Pa., and the Michell Trial Grounds, Andalusia, Pa.

The meeting of the Executive Board was held at the Hotel Walton on Wednesday forenoon, preceding the annual meeting. The invitation of the Society of American Florists to affiliate with that body was brought up for consideration, and it was decided to defer action on it and first study the benefits the National Association of Gardeners would derive through affiliating with another organization.

It was decided to publish a list of the membership of the N. A. G. in the March issue of the official organ. The Gardener's CHRONICLE OF AMERICA. The question of providing a suitable button or emblem for members was discussed, and the subject laid over for future consideration.

The Committee on Awards reported as follows:

Association's certificate, for vase of carnations, Mrs. C. Edward Akehurst. Association's certificate, for a vase of roses, "Jonkherr L. Mock," exhibited by the S. Pennock-Mechan Company. Philadelphia, Pa. Special mention, for a vase of single chrysanthemums "Marguerite Waite" and a vase of "Erlangea tomentosa," exhibited by William H. Waite, Yonkers, N. Y. Special mention, for a dis-play of roses and mignonette by S. Pennock-Mechan Company. Special mention, for a fine display of ferns and foliage plants to Henry A. Dreer, Inc., Philadelphia, Pa. Special mention, for a display of high-grade bulbs, flowering shrubs, etc., to Hosea Waterer, Philadelphia, Pa.

The committee was not able to pass on carnation "Alice," exhibited by Peter Fisher, Ellis, Mass., as the flowers arrived in bad condition.

WILLIAM KLEINHEINZ, JAMES STUART. Committee on Mcritorious Exhibits.

The Committee on Final Resolutions reported as follows:

"Whereas, The Horticultural Society of Pennsylvania has so generously provided us with facilities within its building for the holding of our annual convention and annual banquet.

"Resolved, That the National Association of Gardeners tender to the Horticultural Society of Pennsylvania a hearty vote of thanks

and appreciation; and

"Whereas, The Philadelphia Florists' Club tendered to our members the use of its clubroom during their stay in Philadelphia and its bowling alleys for our bowling tournament.

"Resolved, That the National Association of Gardeners tender to the Philadelphia Florists' Club a hearty vote of thanks and ap-

preciation.

"Resolved, That the association tender a hearty vote of thanks and appreciation to W. Frank Therkildson, Philadelphia, Pa., for his instructive address; to Richard Vincent, Jr., for his interesting paper; Robert Pyle, West Grove, Pa., for his entertaining illustrated lecture at our convention; to J. Otto Thilow, Philadelphia, Pa., for his able services as toastmaster at our banquet; to David Rust for his valuable services before and during the convention; and to the local Committee on Arrangements, Thomas W. Logan, William Kleinheinz and John H. Dodds."

ALEXANDER MacKENZIE, ARTHUR SMITH, JOHN F. JOHNSTON. Committee on Final Resolutions.

#### AMONG THE GARDENERS

Arthur C. Ruzicka has secured the position of head Island. Considerable new development work is under gardener on the C. Oliver Iselin estate, Glenhead, Long way on this place with some new glass under course of construction.

William H. Griffiths, secretary of the Lake Geneva Gardeners' and Foremen's Association, and superintendent of "Altavista Farm," Lake Geneva, Wis., became the proud father of a bouncing boy the early part of this month.

Allan B. Jenkins resigned his position on December 1 as superintendent on the Bryce Estate, Roslyn, N. Y., and James McKay who was succeeded by Mr. Jenkins has been reappointed to the position.

John B. Sullivan, gardener to Charles T. Hoffman, Newport, R. I., is reported as slated for the appointment of postmaster of that city. Mr. Sullivan has served his community in the past as a member of the state legislature.

Edward T. McCarroll has been appointed superintendent of the D. Tatum estate, Glen Cove, N. Y.

William H. Waite, whose contract terminates with Samuel Untermayer on January 1, has resigned his position as superintendent of the Untermeyer estate, "Greystone," Yonkers, N. Y., to take effect January 1. Thomas Hatton, who recently arrived in this country from England, succeeds him. At this writing Mr. Waite has not decided as to his future plans.

Otto Schubert, head gardener on the Sim Estate, Houston, Texas, has succeeded in growing some floral and nursery stock which it was heretofore believed impossible to produce in the semi-tropical climate of his territory. His 'mums and American Beauties this year, it is said, would have been hard to surpass even in exhibition classes.

#### THE GARDENER OF THE PAST AND FUTURE.

BY RICHARD VINCENT, IR.

The gardener of long ago and the gardener of today are really two distinct beings in many ways. The old-timer had many things to contend with that the present-day gardener or florist knows nothing of, unless, like myself, he lived in those so-called good old days. We well remember the duties that were expected of the foreman or manager, let alone the apprentice boy. We used to work from daylight to dark in the long wintertime, then go to supper and return, make labels, stoke the fires and do other odd jobs for an hour or two. But with all this, our great success and achievements in this country were brought about by men trained in this hard school of learning, men who have made a name for themselves, both as florists and gardeners, that has gone the world over.

The work and accomplishments of the so-called college graduate, the kid-gloved farmers or gardeners that many of them are—not that a college education is not a good thing to have—nine times out of ten cannot compete with the hard practical knowledge that is gained by contact with mother earth. Though she stains the hands and clothes with her brown soil, it is good to come in contact with her for it leads the bright mind into investigation and research, clearing it of ignorance of many things that the man that gets only book or superficial knowledge has no idea of.

Let us not, however, cry down any of our young men that are honestly trying by all means at their command to make good gardeners, but let us teach them to drive the spade into the soil of thought, that light may come, and not ignorance, of the workings of nature and nature's ways, so that they may become even better and brighter gardeners than the race of gardeners that have preceded them.

One of the causes of frequent complaints is the inefficiency of those claiming to be gardeners and landscape architects, who really lack the first fundamental principles of the occupation they aspire to and are

only a disgrace to our noble profession.

Too many places have been spoiled by just such men and you can see such places everyday in traveling about, that, were they planted by a thorough gardener, they would be places of beauty and a joy to the owner thereof; but, instead of that, they are a worry and make his heart sore. No wonder with cases of this kind, that many hesitate before putting their money into it. Then again, we have men on many estates, as head gardener or superintendent, whose hands are often tied by the help he has, being too indifferent to give value received; all some being fit for is to hold up a hoe or spade a few short hours in a day, more auxious about the week's pay than any part of the performance that they have to do for it. Of course, there are exceptions; the employers may expect too much, but we find more often that there is not sufficient given, to justify the cost to the owner. Where the manager aspires to make himself useful to his employer, his true worth is recognized sooner or later. Therefore, let us teach our young men coming up to strive to elevate themselves, and their profession, that they may have the respect of the world at large. May we do our part to make it brighter and better to live in as our forefathers did for us, using all the scientific knowledge available, that the products of our gardens and greenhouses may be better and more be accomplished with less labor.

### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. S. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### ASSOCIATION NOTES.

Beginning with the January number, an illustrated article will be published each month, descriptive of the park systems of various Pacific Coast cities. These will continue until convention time, and are intended to inform the membership as to what is in store for them in connection with the trip to next year's convention as well as to stimulate interest in members making the entire coast circuit, via the Pacific Northwest, either going or returning, which can be done at but slight additional expense.

The proceedings of the Newburgh-New York convention, which the secretary expected to have printed and in the members' hands by this time, will not be out until January. Failure to receive photos of all members of the Executive Board is responsible for the immediate delay.

The membership roster in a new form which will probably be pleasing to the members, will be off the press this month.

The cities of San Diego, Cal., and Tacoma, Wash., have been added to the list of sustaining members recently, following solicitation by the secretary. An effort is being made to enroll all of the coast cities, and it is probable that several others will be added in the near future.

This will insure a hearty reception at the various cities for delegates attending next year's convention.

The annual report of Superintendent George A. Parker, of Hartford, recently distributed should be read by every park executive.

Mr. Parker is both original and unique in his methods and conclusions, and his observations are worthy of serious consideration. His chapter on "Milestones in Park Development" is especially good and will be published in full in these columns.

J. Henderson, superintendent of Mt. Royal Park at Montreal, writes to say that he is well pleased with the change of official organ, and likes this magazine very much. Many others have written in the same vein, which is, of course, pleasing to the officers, who had a duty thrust upon them by the convention acting according to their best judgment, and were temporarily criticised by some who did not fully understand the situation.

#### PARK DEPARTMENT PERSONALS

John W. Duncan, past president of the association, is still superintendent at Spokane, Wash., and has just closed a busy year of improvement work. An extension fund of a million dollars for park purposes became available two years ago, and while a considerable amount of it was spent for land, Mr. Duncan was able to add a gold course, athletic stadium, several playgroun's and new park buildings. Early in the spring Mr. Duncan will give us an illustrated article which will prove why members attending next year's convention should stop off in Spekane.

A. A. Fisk, superintendent at Racine, Wis., who created such a sensation at the Newburgh convention with his white suit, now springs another surprise with the announcement of the arrival of a little stranger in his household, Jessie Louise Fisk. The Fisk smile, well known to convention attendants, is probably just a little broader about this time.

Richard Iwerson, formerly superintendent at Calgary, Canada, has secured a position in charge of landscape work for the Washmgton Nursery Company at Toppenish, Wash,

Emil T. Mische, for many years' superintendent at Portland Ore., has a new position and a new title as the result of changes following the adoption of a commission form of government. A commissioner of public affairs is now at the head of the park department, and Mr. Mische is to serve in the future as consulting landscape architect for the department, engaging in private work as well.

Bernard Rifkin, the lost member, supposedly superintendent at Reading, Pa., has been located at Pottsville, Pa., the information being supplied by Chas. A. Seybold, of Wilkes-Barre.

Mr. Seybold, formerly in charge of Carroll Park at Baltimore, is now supervisor of the Bureau of Public Parks at Wilkes-Barre.

J. W. Thompson, superintendent at Seattle for ten years, and who has been passing up the last few conventions because he has been so busy spending four million dollars of extension funds, will have an illustrated article on what he has accomplished, in a future number of this magazine.

Mr. Thompson is one of the charter members of the association and is looking forward to next year's convention on the Coast, and hopes that all of the old-timers and new ones also,

will come by way of Seattle.

C. K. Brock, superintendent at Houston, Tex., reports activity in park lines in his city, \$250,000 in bonds having recently been voted for park improvements. One of the new features to be added was a Zoo in Woodland Park. One of Houston's citizens, a Mr. George H. Herman, recently died and bequeathed to the city for park purposes a prominent city block, on condition that no destitute person found in the park should be arrested or molested. Mr. Brock is one of the few members we have in Southern cities, a very promising field, which the association has overlooked in years past.

G. Hennenhofer, superintendent of Pueblo, Colo., is very anxious that members attending next year's convention should plan their route via the Colorado cities and stop off at Pueblo.

When the association met in Denver in 1913 many promised to stop over in Pueblo, and Mr. Hennenhofer rushed home to be on hand to entertain them, but not a soul showed up, although many passed through Pueblo on the return trip. It is to be loped that next year some of the members will put Pueblo on their list of stop-overs.

#### MILE STONES IN PARK DEVELOPMENT.

By George A. Parker.\*

The mile stones in the development of "Municipal Parks" seems to have been as follows:

1. 1850 when the thought was a single large park that would bring country influences and rural scenes into the midst of city conditions.

2. 1875 when a series of separate parks was conceived.

3. 1890 when large park reservations with connecting parkways or boulevards took form.

4. 1900 when playgrounds and outdoor gymnasiums

became popular.

5. 1910 when park work included public recreation, so that now the word "parks" is fast becoming to mean all those things needed for the people and for each group of people for their recreation in outdoor life, that is so essential to health and happiness.

With each mile stone passed, the meaning of the different words and terms used has increased, and the motif that has led the workers forward has changed so that now it seems necessary to re-state the motif

and re-define some of the terms.

The parks of a city, the influences they exert and the services they render are fast coming to mean all plant and tree life, lawns and decorative grounds, whether public or private, that are within a city. This conception justifies the Park Department furnishing at slightly above cost loam, sod, or other materials for the improvements of private grounds, for such improvements add just so much beauty of the city, mak-

 $<sup>^{\</sup>star}\mathrm{Extract}$  from his annual report as Superintendent of Parks, Hartford, Conn.

ing it more desirable to live in, which is the fundamental motif under all park work. Furthermore, this conception of park service makes every man's home become part of the park system, and connects his front yard with the public parks by means of the street tree planting and park strips, thereby providing a channel of influence between the park department and the private home, similar to that which exists between the street, water and sewer departments.

History demonstrates, and observation confirms the fact that the influence of plant life and rural scenes are essential to strong enduring, well regulated and well balanced home life. Those cities that have ample park and recreation systems well distributed, developed and maintained, have raised the standard of the character

of its citizens.

Gradually and almost unconsciously recreation work has come to be a part of park work. It came first, because parks were open grounds, and recreation needed open grounds; but as the work has gone on, the realization has come that park and recreation requirements are so closely related and united, that neither can be successfully maintained without the other.

What then is now meant by recreation? Much has been written about "Municipal Recreation," especially during the last ten years. At first it meant play for children, but its meaning has expanded until now it includes whatever is done during the leisure hours of the people as individuals, or as groups, or as a whole.

It has three divisions:

1. Private recreation which takes place at home or socially with friends and neighbors, and in which the public has no part.

2. Public recreation privately owned and exploited

for private gain.

3. Public recreation publicly owned, which is either free or furnished at cost or nearly so.

Recreation is helpful in four ways:

First. It provides the means for growth in children, and gives an even development of mind and body. A boy is the man in the making. To form him, parents and teachers try to mold his habits and character. Work and study are but outside influences and forces to lead or compel him to fit into the mold which has been pre-determined. In doing so there are used only

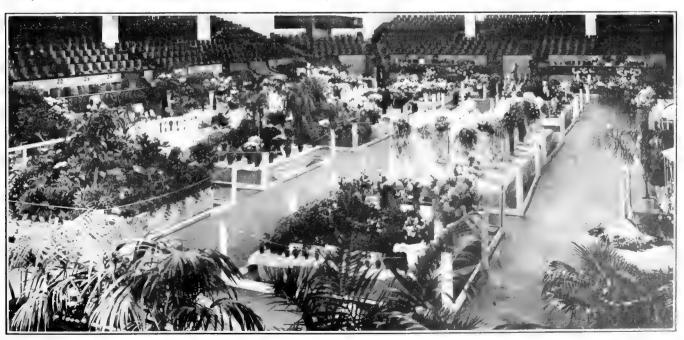

a comparatively small proportion of the number of muscles and faculties that go to make up the boy. Recreation allows for free use of all those muscles that are not sufficiently used in work and study. It responds to nature's call to move or to atrophy. It is a force within, working out. Work and study are forces without working in. Both are needed to make the man

Second. Recreation provided refreshment and restoration to the tired or over-strained body and mind. Nature will replace used or abused muscles and tissues, if suitable rest is given them, and used or partially used muscles and tissues have exercise. Recreation provides just this. It may consist of just comfortably resting in the fresh air, or leisurely walking about, or something that makes one forget himself. It may be music or entertainment, or exercise, but whatever it is, it must be of one's own free will and accord.

Third. Recreation prevents evils and weaknesses of a city, providing it is sufficient to provide wholesome and ample opportunity to do so. The great majority of people prefer good to evil, if an overwrought body or mind and environments do not lead him otherwise. If the recreation provisions of a city are as sufficiently provided for as is the fire department for fighting fires, they will prevent or destroy evil weaknesses as effectively as the fire department does fire. But too often the recreation provision is no better prepared to do its work than the fire department would be if it had only

a hand pump and a bucket brigade.

Fourth. Recreation is the balance wheel for work and play. Any machine which is subjected to irregular work, needs a regulator or balance wheel or both. Machines that do not have them must find a balance between their endurance and the power which drives them, otherwise they are destroyed by the force which was given them to use. The mission of a balance wheel is to store up force when not needed, to give it back when it is. Work and study are the constructive forces of a city. They are irregular in their effect upon the human body and mind, and differ widely as to their requirements and application. Recreation stores up human energy when in abundance, and gives it out when the strain comes.

TEXAS STATE FLOWER SHOW, HELD IN HOUSTON, TEXAS, DURING JUBILET WIFE (81) PAGE of

## City Forestry in Chicago

By J. H. Prost, Supt. of Parks and City Forester.

Before the fire of 1871, the residence streets of Chicago were so well planted with trees as to suggest the civic motto, "Urbs in Horto"—A City Set in a Garden.

The fire destroyed a large majority of these magnificent trees, which were never properly replaced. Chicago, in its rapid commercial and industrial development, sought to supply its aesthetic needs and uphold this civic motto by establishing elaborate playgrounds, beautiful parks and extensive boulevard systems; and while these are necessary and beautiful features of which we may well feel proud, yet in accomplishing all this we have thoughtlessly neglected what may be considered the back yard or living portion of the city, overlooking those features of the "City Beautiful" which become a joy and comfort to the masses.

Trees planted in front of every home in the city cost but a mere trifle, and the benefits derived therefrom are inestimable, when compared to the cost and benefits of the parks, playgrounds and boulevards, and every city, as many have, could well afford to make this its first endeavor toward a "City Beautiful."

By making trees a part of the daily life of our citizens, we are not only beautifying the city, bettering its health conditions, increasing the value of real estate; but we are also educating our people to better appreciate, respect and enjoy our parks.

The home and school are the greatest educational factors of a community, and whatever is for the permanent good of the city should begin at home and in

the school.

In Chicago we have some fifty or more civic improvement organizations, covering all parts of the city, and these are again affiliated, forming a league of improvement associations.

These associations have long realized that the street tree is an indispensable factor in making the city more habitable and essential to an ideal residence street.

In 1904 a Chicago "Tree Planting Society" was organized to promote the planting and care of street trees. It published and distributed a circular setting

forth the reasons why trees should be planted. But definite results were not obtained until January, 1909, when the Chicago Woman's Club put forth determined efforts to establish an office for the municipal control of street trees; by calling a meeting at which there was appointed the Chicago Tree Committee, made up of thirty citizens representing many prominent clubs and societies, with Franklin Mac-Veagh, former Secretary of the Treasury, as chairman. This body proposed to ex-Mayor Bussee, the adoption of an ordinance concerning trees and shrubbery in the streets of the city. The proposition was approved by the Mayor and on his recommendation the City Council, March 21, unanimously adopted an ordinance as drafted by the Tree Committee.

It was agreed by the Mayor and citizens interested that the work ought to be placed in charge of the Special Park Commission, as its work for small parks and playgrounds already extended over the entire city, besides possessing the necessary facilities and ex-

perience in the subject.

The ordinance accordingly gives control of the trees in the streets to the Special Park Commission, authorizes it to appoint a City Forester, who is to direct, assist and advise persons wishing to plant trees, and to have general charge of the care of the trees in the streets.

The ordinance further provides that the City Forester shall superintend, regulate and encourage the preservation, culture and planting of shade and ornamental trees and shrubbery in the parkways of the city of Chicago.

It shall be the duty of owners of lots within whose lot lines trees are growing to keep them trimmed, so that they shall not interfere with the passage of light from the street lamps, and that dead or living limbs shall not overhaul the street or sidewalk so as to interfere with the proper use of the same.

Before planting trees in the parkways of the city's streets a written permit must be obtained from the City Forester, this being for the purpose of controlling the variety, size and character of tree planted. Trees must not be planted nearer together than twenty-five feet in any case.

Gas companies, upon notice, must repair any leak in their gas pipes that may endanger the trees in the

parkways.

No stone, cement or other material shall be permitted in the parkways which may endanger the life of trees in such parkways. An open space not less than two feet in width must be left around any tree planted in the sidewalk space.

Persons carrying on building operations must protect exposed trees in the streets with guards so that

they shall not be injured.

Violations of the ordinance are punishable by a fine of not less than \$5, nor more than \$100, for each offense.

Upon assuming the duties of the office in May, 1909, it was found that the Special Park Commission, by the passing of this ordinance, had added to its supervision about 1,486 miles of parkway lying along improved streets, and 1,370 miles of parkway lying along unimproved streets and 1,415 miles of alley.

Eighty thousand (80,000) would be a fair guess as to the number of trees growing in the parkways of

Chicago.

The department was immediately called upon to give advice to citizens planning the planting of trees and shrubbery in the parkways, to consult with neighborhood and street improvement associations who desired advice on planting, and these clubs also arranged for meetings of property owners, where an outline of the purpose and activities of the office were given in addition to information on street tree planting. Our efforts were next directed toward informing citizens, police department and public utility corporations of the passage, purpose and contents of the ordinance, and to arouse an appreciation of the services this new department could render our citizens.

Realizing the vast importance of this work, the extent of territory covered, and the unlimited possibilities. I was determined to fortify the office with as much available information on city tree work as could be gathered. To this end the foresters of a number of cities courteously gave me invaluable information

and suggestions.

Washington, of course, affords the best opportunities for the study of city street tree work, and the secret of their success lies in the fact that they have had the money, the nursery and the man.

Lack of municipal control and planting regulations has imposed upon Chicago an unnecessarily large number of soft wood trees. Then, too, we find elms, ash, catalpas, Carolina poplars and cottonwood trees are mixed along the same street and varying greatly in size in the same block, and this treatment is not uncommon even in the most choice residence districts.

Stumps and dead trees have stood in the parkways for years, becoming an eyesore and menace to the public. Many of these trees were killed by gas leaks, while others have been outrageously mutilated by careless and indifferent citizens and the various public

utility corporations.

Those dead, dying and unsightly trees have in many cases discouraged and prejudiced our citizens against the planting of new trees, and they have become indifferent and unappreciative of the beauty and com-

fort to be enjoyed in well-planted streets.

A series of instructional pamphlets were printed for free distribution; the first outlining the inception of the movement and the ordinance; the second, "The Call for Trees," attempts to tell how trees make a city more beautiful, healthier, wealthier and stimulate civic pride; the third is intended to impress our citizens with the existing barrenness of certain streets, the causes which have combined to bring about these conditions; suggesting preventive remedies and directions for the proper removal of dead trees and the trimming of unsightly ones; the fourth gives some idea of "What, Where, When and How to Plant"; the fifth helps for the City Beautiful—tells how to make "Gardens in windows, on porches and in front and back yards."

These pamphlets hurriedly compiled have necessarily been brief. The demand for them has been so great, however, that a second and in two cases a third

addition has been printed.

Our newspapers have given this movement their hearty support. Our police department has acted promptly in reporting and prohibiting violations of the ordinances and the telephone and electric light companies have co-operated by printing their own permit forms as recommended by the department.

Many of our improvement associations and women's clubs have arranged for lectures on City Tree Planting. These talks usually are given in the evening, are instructional rather than amusing. During the year 1910 about 75 of these illustrated lectures were delivered before improvement associations, women's

clubs and the public schools.

Last year 385,000 catalpa speciosa seedlings were planted by the children of Chicago. These were supplied to them at a cost of one cent. And after making many inquiries I feel safe in stating that this planting was so carefully done and the seedlings were so well taken care of that at least 80 per cent. of them survived. Facts have come to my attention showing that the little trees suffered from altogether too much care. In one case a little boy five years old was so intensely interested that he pulled his little tree up by the roots each day to see how much it had grown. In another case a little girl picked off the leaves from her own little trees and pressed them in a book. This affection was disastrous to the little tree, of course.

This year 300,000 Russian mulberry seedlings were planted, and I am sure each child took a great interest in its own little tree which it planted or helped to plant, and they will afford them great pleasure to see the tiny tree grow, feel proud of their share in the celebration of Arbor Day. But the child's interest does not stop here, for long after its happy childhood days are over it will eagerly watch the returning buds

each spring, and during the summer while watching other children plan beneath its spreading branches the full meaning of tree planting is realized.

This tells the story of why I have encouraged the wholesale planting of penny trees by the children on

Arbor Day.

The appreciation of things useful and things beautiful should begin at home and become a part of our everyday life. Thus, with our residence streets well planted with the proper varieties of trees, the young can grow up knowing, respecting and appreciating the tree for its usefulness, learn to admire its beauty of form and color, and in this way we may instill a patriotism that will mean a love for the home and a love for the city.

## JOHN McLAREN ACHIEVES ANOTHER SUCCESS.

John McLaren, world-famous landscape gardener, who transformed the Golden Gate Park at San Francisco from a barren waste of sand dunes into one of the greatest parks in the world, is converting the grounds of the Panama-Pacific International Exposition into a Garden of Eden. Hundreds of thousands of rare trees and millions of blossoming shrubs and flowers are already growing upon the exposition site, and it appears as though the ground had been cultured

JOHN McLAREN.

for years. There are giant tree ferns from Australia, rhododendrons from England, huge creole palms from Cuba in the collection. Mr. McLaren knows the life of the plant from seed to flower. Today the exposition grounds are like a city of shimmering green domes and red-tiled roofs, set in gardens such as are only possible to produce in California. For the great golden garden of the main entrance plaza over 700,000 golden flowering plants have been planted. In the Court of Palms more than 50,000 Spanish iris yellow wall-flowers are set out in addition to some 200,000 yellow pansies, 100,000 yellow daffodils and 100,000 yellow poppies. In the Court of Flowers, we are told, 50,000 golden tulips, 150,000 golden poppies and 50,000 daffodils will meet the visitor's gaze. It is estimated that a thousand staghorn ferns, 400 species of orchids from the Philippines, 200,000 trees and flowering shrubs and nearly 2,000,000 bulbs, with thousands of palms, are used to make the setting for the palaces.

#### HERE, THERE AND EVERYWHERE

#### "WINTER INJURY" OF TREES.

It is a matter of common observation that many of our forest and cultivated trees suffer at times from the effects of severe cold, of sudden and extreme temperature changes in winter. Properly the term "Winter Injury" must include injury to all parts of the tree, such as winter killing of the tips of branches, root injury and injuries to the trunk; but in this paper only the latter will be considered.

Of injuries to the trunk there may be said to be three types -

frost clefts, sun scald and crown rot.

Frost clefts or cracks are, as their name indicates, longitudinal cracks in the trunk formed under the influence of extreme cold. They are usually, though not always, evident externally, pro-

ducing a corresponding crack in the bark.

Such cracks are believed to be due to a greater contraction of the tree trunk in a tangential direction than in a radial direction. Professor Müller Thuegan offers an explanation of this unequal contraction in the anatomical structure of the trunk. A cross section of any woody stem shows radiating lines of fibro-vascular bundles, composed of comparatively firm cells, separated from each other by strips of softer tissue, the medullary rays. Contraction of a tree trunk under the influence of cold is due to a loss of water consequent to freezing; the medullary tissue loses water more readily, and thus contracts more rapidly than the tissue of the cascular bundles, then, would naturally resist a tendency to radial contraction; tangential contraction, on the other hand, could readily take place, due to the interspersion between the bundles of the easily contracting medullary rays. When the tension differences thus set up become great enough in other words, when the cold reaches a sufficiently great degree, a frost crack is formed.

These cracks close on thawing and usually heal rapidly, but until entirely healed will reopen with a less degree of cold than that which caused the original injury. Thus, if proper weather conditions prevail the same crack may be reopened during several successive seasons. Since every time the crack reopens the healedover surface is ruptured, and in the new tissue formed at the subsequent healing, is laid down over this, the result of projecting frest ridge of, as the Germans express it ("frost leister"). Two such frost ridges on an oak trunk are shown in the accompanying

photograph.

The occurrence of a few mild winters in succession is necessary to the permanent healing of a frost crack. It is, of course, unnecessary to state that even after healing at the surface the

crack still persists in the interior of the tree.

Often after a severe winter injured areas in the bark may be observed. In such places the bark appears discolored, dead and loosened from the tree, often split open, exposing the wood beneath. On examination it is found that (cotex cambium) and sometimes a portion of the sap wood has been killed. Such injury is almost invariably confined to the southwest of the tree. Since this is the sunny side, the injury is popularly called "sun scald," and has been ascribed to the action of the sun in warming up the tissue from a condition of severe cold. In the present state of knowledge on this subject it is unsafe to make any assertion as to the exact manner in which this injury takes place. but it is undoubtedly due in some way to the interaction of cold with heat from the sun's rays. Rapid thawing cannot be the cause, since, contrary to the popular belief, the rate of thawing of frozen tissue has no effect on the nature or degree of injury from freezing. That the injury is dependent upon a peculiar set of climatic factors is evident from the fact that it is unusually severe and widespread in certain seasons, and entirely absent in others.

Sun Scald is a serious trouble with fruit growers, fruit trees being particularly susceptible. The initial injury is often followed by canker and wood-destroying fungi, making the matter

doubly serious.

Sun Scald occurs chiefly on the trunk or at the crotch of main branches. A similar injury is often observed at the base, or crown, of the tree. This also differs from the above type of injury in not being confined to the southwest side. It seems that the tissue at the crown of a tree is particularly tender and susceptible to injury from freezing. Since this type of injury is usually followed by wood-destroying fungi, it has been popularly designated as Crown Rot, Collar Rot or Collar Blight, the initial cause of the injury being lost sight of in the consideration of the evil that follows. This type of injury is in reality little different from the former type and the same relative susceptibility of varieties may be noted. Certain varieties of apple trees, especially the King, seem to be subject to Crown Rot, even under the most favorable conditions.

Obviously, the condition of the tree will influence its susceptibility to winter injury.

Trees which have made a late growth and have entered the winter in an unripened state are particularly liable to injury. Weather favoring late growth in the fall is thus as much of a factor as severe or changeable weather in winter.

Unfortunately, in this case we are dealing with factors beyond our control, and preventive or remedial measures are necessarily

unsatisfactory.—Tree Talk.

#### WITHDRAW PROTECTION FROM EUROPEAN STARLING.

In its annual report for the last fiscal year, the Bureau of Biological Survey of the U. S. Department of Agriculture reports

as follows on the European starling:

Introduced into the United States nearly twenty-five years ago, the European starling has gradually extended its range from New York City, and now it is found in the neighboring States of Connecticut, New Jersey, New York, Pennsylvania and Massachusetts. During its migrations in search of food it ranges much farther from the original center and occurs in considerable numbers as far south even as the District of Columbia.

The starling is markedly insectivorous, especially in summer, and preys upon many noxious varieties. In this respect it is to be classed among our useful birds. So far as is known, it has not proved destructive to grain crops, but it is known to be very fond of small fruits, and as it associates in large flocks, it is likely to become a pest to the orchardist. In addition, it prefers tree cavities, boxes, or recesses in buildings for nesting sites, and thus is brought into direct competition with certain of the useful native birds, more particularly the bluebird, purple martin, white-bellied swallow, house wren and flicker.

The bird is steadily extending its territory, and it will be wise to withdraw all protection from it, as has already been done in Connecticut, New Jersey, New York and Pennsylvania, including the center of its abundance, with a view of checking its increase and spread. The shipment of these birds from one State to another has been prohibited under heavy penalty by act of Congress. Under ordinary circumstances, even after all protection is withdrawn, the bird will probably prove to be capable of taking care of itself. That ultimately it will spread over a large part of the

United States is highly probable.

#### A VISIT TO A SNAKE FARM.

One of the most interesting places in Brazil is the Instituto de Butantan, situated among the Mar Mountains, several miles from Sao Paulo, the second largest city of the republic. This institution, which costs the Brazilian government more than \$40,000 a year, studies the snakes of the country, extracts the poison from those that are venomous, and changes it into a serum that will cure those who are bitten by snakes.

There are only two such institutions in the world, the other being at Calcutta, India. The Brazilian farm is fourteen years Within the last year the government has built a fine new building that contains a very excellent medical and chemical

laboratory.

Outside the building, in a long, rectangular plot, surrounded by an iron fence and a cemented moat, are sixteen or twenty beehive-shaped structures of cement; cement paths connect them with one another and with the moat. Each of these has four small doors, with a hole in the centre. Every morning an attendant comes round with a long rod, which has a bent iron hook on the end, puts it in at the door holes, and removes the doors, Slowly the snakes come out to creep in the grass, bask in the sun or swim in the pool. In another park at the side of the building there are more such houses. In that park are trees, and it is a remarkable sight to watch those trees. At first you see nothing but the trees; but the longer you watch them, the more wriggly they become, for they are alive with snakes! The farm has about 1,500 snakes corralled for research purposes,—Exchange.

#### FERTILIZER RESOURCES OF THE UNITED STATES.

In discussing the fertilizer resources of the United States, the Bureau of Soils, U. S. Department of Agriculture, in its annual report for the fiscal year ending June 30, 1914, says in part:

While the extraction of potash from such natural silicates as the feldspars is quite feasible physically, it is not practicableeconomically, unless some other salable product is produced in the same operation. An investigation into the use of feldspar in the fixation of atmospheric nitrogen showed promise of a practical method of producing ammonia simultaneously with potash from The most premising American source of potash. ever, is the annual crop of giant kelps on the Pacific coast. Working maps have now been made of nearly all the commercially available kelp beds from the Cedros Islands to the Shumagins, off the Alaskan coast. The area of these beds aggregates nearly

400 square miles, capable of yielding annually, either as dried kelp or as pure potassium chloride, over six times the present consumption of soluble potash salts in the United States, or something more than the world's present total production. The development of a great American industry, based on the conservation and utilization of this important national resource, of fundamental importance to the national agricultural interests, seems now to be a matter of time only.

If all the coal that is now coked in the United States were treated in modern by-product ovens and the ammonia thereby saved, the nitrogen tonnage would be about that now consumed in the fertilizer trade of the country. While the transition from the old "beehive" to the modern furnace method is steadily progressing, the greater dependence for nitrogen carriers yet remains in cottonseed meal, slaughterhouse by-products, fish scrap and some other less important materials. The growing and insistent demand for more nitrogenous feeds to support the meat production demanded by the dietary customs of the American people is gradually but steadily withdrawing these "organic" carriers from the command of the fertilizer manufacturers, while the demand for nitrogen carriers is steadily increasing. necessity for artificial methods of fixation of atmospheric nitrogen in the United States is not immediately present, but is approaching rapidly. It would be premature to announce the results of the department's investigations as yet, but the types of material which are of commercial promise for American conditions have been pretty well worked out and substantial progress has been made in the investigation of the fundamental technical factors which must control the production of these particular types. At the same time investigation is being made of other possible sources of nitrogen.

Although improvements are being made, the wastage of phosphate rock at the mines is still disconcertingly large. In Florida, where the most actively-worked fields are situated, investigations of the Bureau of Soils have shown that practically 2 pounds of phosphorus goes to waste for every pound produced in merchantable rock. Studies are now being made looking to the recovery or prevention of some of this wastage by mechanical methods, while several chemical methods have been carefully investigated.

#### STUDY OF PLANT ODORS.

A rose by any other name would smell as sweet and onions and garlies would be the malodorous delusiens and snares that they are even were they called violets and narcissus. What, then, is it which causes the odors of flowers and the noxious nasal annoyances of molds and other lowly plants? M. Eugene Charabot, the able chemist, now rushes into the breach in an attempt to explain all this.

What is a plant odor? Where does it come from? How is it distributed? Why are some of them fragrant and others malodorous? After a ten-year research independently and along with Al. Hebert, M. Charabot now attempts to answer some of these

There are two great groups of odoriferous vegetation. In the one division the fragrance emanates and is found in the flower of the plants; in the other the odors spring from the green parts or bulbs. The perfume of the flowers usually surpasses that found in the rest of the plant. The rankest compound of villainous smell that ever offended a nostril is found in the latter, whereas the balmiest, most ambrosial bouquet of redolent scents is to be obtained from flowers.

The odors usually, he says, make their earliest appearance in the young, green shoots. Thence they continue to accumulate until the plant flowers. Then the odorous compound migrates from the leaf into the stem, and thence into the inflorescence and obeys the well-known laws of diffusion.

When fertilization of the plant takes place some of these oils are used up by the flowers, while at the same time the green parts are called on to make more of these fragment oils.

The practical outcome of this is that to harvest the perfume oils yielded by the plant it should be most profitably carried out just before fertilization occurs. For after this the odorous principles appear to descend again into the stem and generally into the or gans other than the flower. This migration is probably the withering and drying up of the inflorescences.

If the two learned gentlemen wish to know of the "rankest compound of villainous smell that ever offended a nostril" we direct their attention to the flowers of the black Calla, or its near relative. Amorphorhallus Rivieri. If a whiff of these two malodorous flowers are not sufficient to convince them that "the balmiest, most ambrosial bouquet of redolent scents" are not found in some flowers we commend to their investigation those of the Staphelia and of the tropical pipe vines. Again some of the Clerodendrons bear flowers of the most delightful fragrance, while the foliage has a fetial cdor Paritie Garden

#### A ONE-TREE FARM.

On the borderland of Bolivia is a farm, and a rarely prosperous one at that, which consists of a single tree. It is a rubber tree and it supports a family of seven persons in comparative affluence. This lone tree has been nursed along for generations, until it now measures about 27 feet in circumference at the base. The daily yield of caoutchouc is more than twenty-two pounds during the 120 days of the year that the tree can be successfully tapped, or almost a ton and a half of this precious product annually. On the basis of this yield the tree has an estimated value of \$60,000. Few growing things are so tenderly guarded.

There is an alligator pear tree in California that is estimated to be worth about \$20,000 a tree that is said to employ a press agent and to carry a life insurance policy. It has been widely heralded as the tree of trees, and cuttings from it are sold for almost their weight in gold. But it must now play second fiddle to this Bolivian marvel, and before long we may hear of some new wonder of Nature that will outrival the South American superlative of all single-plant growths.

As a sublimely simple farming operation, however, we must all bew for a while to this one tree ranch of the inland republic, Lachange.

#### QUERIES and ANSWERS

"I would like to get some information on the cultivating of the blueberry, which I understand is finely grown on some of the estates in Massachusetts. They grow to perfection in our section in the wild state, but we do not seem to succeed in cultivating them successfully. Any information you can give me regarding their culture will be appreciated."--U. M., Nova Scotia.

#### DIRECTIONS FOR CULTIVATING BLUEBERRIES.

Blueberries are easily cultivated after the soil is once prepared. After ten years' experimenting with the swamp blueberry (Vaccinium ('orymbosum) we have found that a swampy place is not absolutely necessary, as is commonly supposed, in order to successfully grow these berries; but an ordinary upland place will do as well. We have found the best method is to remove the top soil 1 or  $1\frac{1}{2}$  feet deep and fill in with 2/3 peat and 1/3 sharp sand well mixed. (If bog peat is used, allow it to be exposed to sun for one season before using.) Plant the bushes when in a dormant state, pressing the soil firmly about the roots. If wild bushes are used, be careful to obtain as many roots as possible, and prune a greater part of the tops off, as blueberries make new roots until after they are leaved out. Under this treatment our bushes have improved steadily each year, some bushes yielding from four to seven quarts of large berries, many measuring 9/16 of an inch in diameter, and a few larger, of excellent flavor and exceptionally fine keeping qualities. Seedlings are easily grown in sifted soil of one-half peat and one-half sharp sand with good drainage, and kept moist in a partially shaded place. We sow our seed in August and keep inside over winter, planting out in early spring. Blueberries like an acid soil, moist, but well drained, and lime or other fertilizers should not be used, and no vegetable matter should be allowed to grow among them. We have a quantity of four-year-old seedlings grown from our best berries that will fruit next season. For permanent planting, the bushes should be set about 8 feet apart, as they will cover this space when matured. Blueberry bushes are long-lived and should be given plenty of room to develop.

The blueberry is a useful as well as ornamental shrub, and we expect to see them planted extensively on private and public grounds in the near future.

The ordinary field blueberries (Vaccinium Pennsylvanicum) do better in the sandy uplands with a coating of upland peat, where they are more subject to drouth. C. H. Chamberlain, Valuel,

#### CHARLES H. TOTTY FULLY RECOVERED.

Charles H. Totty, of Madison, N. J., who was confined to the Overlook Hospital, Summit, N. J., for a month, undergoing an operation, returned to his home on Friday, the 11 inst. Mr. Totty's health is so improved that he is able again to attend to his businessin fact, he felt so well on leaving the hospital that he immediately proceeded to his greenhouses and enjoyed an inspection of the same before going to his home.

#### HARRY A. BUNYARD, PRESIDENT NEW YORK FLORISTS' CLUB.

At the annual meeting of the New York Florists' Club. Harry A. Bunyard was elected to the presidency of that organization, succeeding William H. Duckham. Responding to the call to the platform, Mr. Bunyard remarked that the election to the presidency of the New York Florists' Club was the happiest moment of his life, barring that of his marriage; that he never regretted being married and felt sure that he would never regret being elected to the presidency of the New York Florists' Club, and trusted that the members would never have cause to regret electing him to the office. J. Keney was elected vice-president; John Young, re-elected secretary; William C. Rickards, re-elected treasurer. W. R. Cobb, J. H. Feisser and Emil Schloss were elected trustees.

#### A MAMMOTH PLANT STORE.

The MacNiff Horticultural Company, New York, is completing what will probably be the largest store of its kind in this country. It has leased the property next door to its present location and is constructing a store room 25 x 100 with ceiling 30 feet in height. This will be connected with the main store and in it will be conducted the auction sales. The height of the room will permit the largest size palm and indoor plants being exhibited therein for exhibition purposes.

#### AMERICAN SWEET PEA SOCIETY.

A meeting of the executive board of the American Sweet Pea Society was held at the offices of Peter Henderson & Co., New York City, on Tuesday afternoon, November 24, with W. Atlee Burpee in the chair. The principal business was the arrangements for the shows to be held during the coming Summer. It has been arranged that two shows be held; one in San Francisco, the other in Newport, R. I. The dates for the San Francisco show have not yet been fixed. The Newport show, which is to be held under the auspices of the Newport Garden Association and the Newport Horticultural Society, in the Newport Casino, will open on July 8, and continue through July 9. A very liberal preliminary premium list has been prepared and issued by the Newport organizations. Since this time the Newport Garden Club has donated \$100 in prizes. Copies of this preliminary schedule may be obtained of the secretary, Harry A. Bunyard, 342 West Fourteenth street, New HARRY A. BUNYARD, Secretary. York City.

#### LAKE GENEVA (WIS.) EXHIBITION.

The tenth annual chrysanthemum exhibition of the Lake Geneva Gardeners' and Foremen's Association was held in Horticultural Hall, November 6-7, 1914. weather was ideal and the public attended in greater numbers than ever before. The principal feature of the exhibition was the groups, twelve in number being staged, the greater number being placed round the outside of the room, with a group of foliage plants in the center, and flanked by the specimen plants and large cut blooms. effect was conceded to be the prettiest ever seen in the hall. Strong competition was seen in the class for group of chrysanthemums with ferns and palms, four competitors coming out for the Livingstone prizes. The judges awarded first prize to Mrs. F. T. A. Junkin. While the number of cut blooms was not as numerous as in past years, owing to the advanced season, some exceptionally fine flowers were shown. J. J. Mitchell's vase of 12 William Turner, 12 F. T. Quittenton, Bronze Brighthurst and Colonel Appleton, and Mrs. A. C. Allerton's display of varieties William Turner, Elber-Lloyd Wigg, M. Louis Rossian, F. S. Vallis and Drabble being excellent. The association's cup was taken by a fine specimen plant of William Turner, shown by Mrs. Allerton. Some excellent ferns and foliage plants were shown by N. W. Harris and J. H. Moore. Groups of anemones, pompons and singles were exhibited by C. L. Hutchinson, a great many being his own seedlings, conspicuous among them being the beautiful white Anemone "C. L. Hutchinson," which will probably be placed on the market next spring. Other exhibits worthy of note were carnations from Mrs. F. T. A. Junkin, orchids from J. J. Mitchell, vegetables from N. W. Harris, and onions from J. H. Moore, Perpetual flowering nymphaeas from Wm. Tricker, Arlington, and chrysanthemums from Chas. H. Totty Madison, N. J. The judges were Wm. Currie, of Milwaukee, Wis., and F. Kuehne, of Lake Forest

In the competition for cut blooms and pot plants awards were made in fifty classes A summary of the division and prize winners follows:

Chrysanthemum cut blooms-Mrs. A. C. Allerton (G. Blackwood, gard.), five first and one second prizes; J. J. Mitchell (A. J. Smith, gard.), five first and two second prizes; Mrs. F. T. A. Junkin (Axel Johnson, gard.), one first and three second prizes; Mrs. H. H. Porter (W. Wahlstedt, gard.), one first and one third prize; J. H. Moore (A. Martini, gard.), one third prize.

Chrysanthemum pot plants C. L. Hutchinson (W. P. Longland, gard.), three first prizes; J. J. Mitchell, one first and one third prize; Mrs. A. C. Allerton, one second prize.

Group of chrysanthemums arranged for effect with palms and ferns (prizes donated by James Livingstone, Milwaukee, Wis.)—Mrs. Junkin, first; J. H. Moore, second; N. W. Harris, third.

Miscellaneous plants—N. W. Harris, eight first prizes; Mrs. H. H. Porter, one first prize; J. J. Mitchell, one first prize; J. H. Moore, one second prize.

Specimen chrysanthemums Mrs. A. Allerton, two first prizes and the association cup for best specimen chrysanthemum (Wm. Turner); J. J. Mitchell, two first and two second prizes; Mrs. F. T. A. Junkin, one first and one second prize; N. W. Harris, one first and one third prize.

Roses—A. B. Dick (F. G. Kueline, gard.), three first prizes; Mrs. F. T. A. Junkin, one first and three second prizes; J. J. Mitchell.

one first prize.

Lily of valey, 25 sprays Mrs. F. T. A. Junkin, first; N. W. Harris (J. Krupa, gard.), second.

Fifty violets-Mrs. F. T. A. Junkin, first. Best 10 flowering orchid plants, with ferns and foliage plants, W. A. Manda, South Orange, N. J., prize-J. J. Mitchell, first.

Carnations-Mrs. F. T. A. Junkin and J. J. Mitchell were first and second, respectively. in all classes. Mrs. Junkin also won the award in the class of 12 blooms, new varieties of 1914.

Special Mention-Mrs. F. T. A. Junkin. for vase of Carnation Benora.

Honorable Mention-Wm. Tricker, Arlington, N. J.; for perpetual flowering Nymphaea Mrs. Woodrow Wilson; Chas. H. Totty, Madison, N. J., for fine collection of pompoins and single chrysanthemums; J. H. Moore, for beans and lettuce.

In the display of vegetables, not to exceed 20 varieties, N. W. Harris was awarded the Coddington medal. Awards were also made in classes for celery, potatoes, apples and onions. W. H. GRIFFITHS, Sec'y.

#### HOUSTON (TEX.) FLOWER SHOW.

The first annual show of the Texas Florists' Association was held in Houston, Texas. November 12-13-14, in the City Auditorium. Being the largest show of its kind ever held in the State, it attracted much public attention and was pronounced a success in every

Exhibits came from other cities in Texas, from Chicago and other Western floral growing centres. Two long-distant exhibits which attracted much attention were those of Charles H. Totty, Madison, N. J., a fine exhibit of chrysanthemums, which made a fine the shipment of carnations from C. H. Frey. of Lincoln, Neb. Chrysanthemums, roses and carnations predominated, although there were many fine exhibits of decorative plants.

One of the features of the show which attracted much attention was a model of the new George Hermann Park, as it will appear when the landscape gardener has completed This exhibit was made by C. Brock, city superintendent of parks. Mr. Brock also exhibited a number of decorative and flowering plants.

#### MARYLAND WEEK IN BALTIMORE.

The seventeenth annual meeting of the Maryland State Horticultural and allied societies, held in the Fifth Armory, Baltimore, Md., November 16 to 21, proved a great suc-

The horticultural exhibits occupied the centre of the hall, being dissected from other sections by a 360-foot circular southern smilax hedge. A pergola entrance and three exits crowned with Cybodiums, Phoenix Roebellini, etc.

One of the chief attractions of the show and a decided novelty of much merit occupied the centre of the enclosure. This consisted of the Baltimore Florists' Club vase of red This consisted cedar bark, standing on a pedestal with 360 white and yellow specimen 'mums, and attained a height of 15 feet and a spread of 10 feet. The base of this wonderful vase was a 5-pointed star design filled with highly colored crotons and other exotics from the Baltimore Park Commission. The club mem-

C. | bers contributed the flowers, while the credit of designing, building and decorating the club vase belonged to William Feast.

A vase of twenty white 'mums exhibited by Charles Siquard with William Turner proved the best in the show. The same variety was also well shown by George Morrison, superintendent to Mrs. H. B. Jacobs.

Pompons were displayed to great advantage, and their unique colors and decorative abilities were well demonstrated by several exhibitors. Well-grown bush 'mums in 12-inch pots were shown by Mrs. W. Cochran (Mack Richmond, gardener). Fine displays of carnations and roses were seen at

Apples made a large exhibit and were of good quality. Other fruits, vegetables, forestry, dairy exhibits, etc., were well represented. HARRY TURNER.

#### PITTSBURGH FLORISTS' AND GARDEN-ERS' CLUB.

The meeting of this club at the Fort Pitt Hotel on the evening of December 1 was very enthusiastic and quite well attended. Jno. S. Gillespie, State Engineer, gave an informal talk on good roads. Early in his remarks he established himself in the good graces of his hearers with his Scotch stories which, being Scotch himself, were given with the added charm of the Scotch dialect. Mr. Gillespie thinks the last word on good roads has by no means been spoken. good road of yesterday is the poor road of today, and while the automobile has been the greatest factor in creating the desire for good roads, the heavy auto truck is the greatest factor in their destruction.

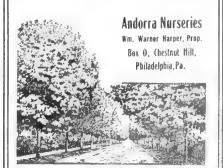

President McCallum gave an exhibition of a process he learned in Australia for the lengthening of the preservation of the flowers on a blooming plant. Taking a thrifty, blooming plant of Primula obconica, he washed the soil from its roots. Then placing some wet sphagnum in a shallow dish he spread out the roots of the plant thereon, and covered them thickly with wet moss, supporting the plant in an upright position as it had been in the pot. It is claimed that a plant treated this way will remain display, although four days on the road; and in bloom much longer than it would surrounded by soil in the pot. Mr. McCallum

took the plant away with him, and will! of the program was furnished by Arthur laing it before the club at the next meeting that all may see the success of the process. This scheme, while not new, is practically new to the florists in this vicinity so far as I know. There were some pleasing poinsettias, begonias and cypri pediums exhibited by the Bureaus of Parks. Northside and Schenley. A rising vote of thanks was given Mr. Gillespie for his

At the next meeting of the club in Jana ary the nomination of officers for 1915 will be taken up.

H. P. JOSLIN, Sceretary.

#### PATERSON (N. J.) HORTICULTURAL SOCIETY.

At the annual meeting of the Paterson (N. J.) Horticultural Society, held Tuesday evening. December 2, the following officers were elected for the ensuing year; President, Joseph Ackerman: vice-president, Dr. Thomas Moore; recording secretary, Sebastian Hubschmidt: financial secretary. Francis Bredder; treasurer, Hugh Clark. In the monthly competition the award went to F. Milne of Totowa, who showed a magnificent vase of carnations.

#### NEWPORT HORTICULTURAL SOCIETY.

This society held its annual meeting on December 8, and the following officers were elected for the ensuing year: President, William MacKay: first vice-president, John B. Urquhart; second vice-president, James Bond: treasurer, A. K. McMahon; recording and financial secretary, William Gray: sergeant-at-arms, James Watt. Executive Committee, with the above officers: Richard Gardner, Alexander MacLellan, Bruce Butterton, James J. Sullivan, Andrew L. Dorward, James Robertson, Fred Carter, Audrew S. Meikle and Alexander Fraser. Reports of the treasurer and secretary show the society to be in a very satisfactory condition.

The coming year promises to be the most eventful one in the history of this soulty. as it has already voted to join with the following-named organizations in holding exhibitions in Newport; American Sweet Pea Society and Newport Garden Association on July 8 and 9; Newport Garden Club in August: also monthly shows through the summer months with the Newport Garden Association. Lectures on gardening subjects are also provided for through the winter months.—Horticulture.

#### MENLO PARK (CAL.) HORTICULTURAL SOCIETY.

The second annual banquet of the Menlo Park Horticultural Society was held on Saturday evening, November 28. Over eighty people were at the tables, all members of the trade along the peninsula, and it was voted the most successful affair ever held by this hospitable society. James T. Lynch was the toastmaster of the evening Henry Maier, of Burlingame, Cal., gave the society a splendid talk, which was appreciated by all the members. President Henry Goertzhain responded, and was listened to very attentively, pointing out how the society could expand and pledged himself to see that it would do so. Wm. Kettlewill, of Burlingame, also praised the society's methods of holding flower shows. John M. Daly. vice-president of the society, made an eloquent plea for a larger membership, with the result that there will be quite an appreciable increase next meeting. George Nunn amused the members with reministations of the early days of the society, and organized in the office of the Friend Nurwas heartily applicated. The musical part series at Rye, N. Y. Starting with fourteen

Bearsley. Owen O'Donnell, Harry Homewood, Jack Atkin, Bernard O'Donnell, Frank R. Roach and Jack Patterson. After the musical program President Goertzhain presented the cups to the winners at the last flower show. The principal ones were David Bassett, Wm. Kettlewill, John M. Daly, John Carbone, Andrew McDenall, Jack Sinclair and C. Ulrich.—American Florist.

#### COMNECTICUT HORTICULTURAL SOCIETY.

This society held its annual meeting on Friday, December 11, in the county building. Hartford. Before proceeding to the election of officers, President Huss requested that a new president be elected in his stead, inasmuch as he felt that a change was desirable and that he had held the office for six years and should therefore be released. After the secretary and treasurer made their reports, we proceeded to elect officers for the ensuing year, which resulted as follows: President, Warren S. Mason, Farmington: first vice-president, George H. Hollister, Hartford: second vice-president, Carl Peterson, West Hartford; third vice-president, Oscar F. Gritzmacher, New Britain; secretary, Alfred Dixon, Wethersfield; secretary, Alfred Dixon, Wethersfield; treasurer, W. W. Hunt, Hartford; librarian, William T. Hall, Hartford; botanist, C. H. Sierman, Hartford; pomologist, G. H. Hollister; county vice-presidents; Middlesex, Alex, Cumming, Jr., Cromwell; Fairfield, Charles H. Plump, West Redding; New Haven, John H. Slocombe, New Haven; Windham, Frank M. Smith, Willimantic; Tolland, Theodore Standt, Rockville; Litchfield, Walter Augus, Chapinville. The president will announce the executive committee at the next meeting.

The treasurer and secretary were appointed a committee to solicit the members for contributions for the purpose of purchasing a suitable present for the retiring president

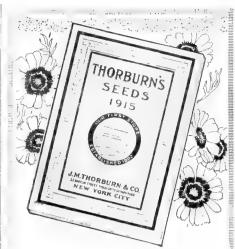

Mr. Mason is the grandson of C. S. Mason who held, in New Britain, in 1882, the first flower show ever given in the State of Connecticut. He was born in Meriden in 1879. For the past fourteen years he has had charge of the conservatories and grounds of the late A. A. Pope, of Farmington, which are conceded to be among the best in this section of New England.

The next meeting will be held January 8. 1915, when a program for the first half of the year will be presented.

ALFRED DIXON, Secretary. Wethersfield, Conn., December 11, 1914.

#### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

The "boys" turned out in force to attend the monthly meeting of the society, held in Greenwich, Conn., Friday evening, December 11. President Robert Williamson presiding. President Williamson concluded his 24th consecutive monthly meeting in his term of two years. A rising vote of thanks was tendered to him for his unfailing courtesy and interest in the society's welfare This being the annual meeting, the officers for the ensuing year were elected. An enthusiastic aggregation of "live wires" were elected to office, assuring the society of a continuation of the phenomenal successes of the past. The December meeting also marks the fourth anniversary of the organization of the Westchester and Fairfield Horticultural Society. The writer had the pleasure of being present on the evening of

members, today we have an enthusiastic membership of Horticultural workers consisting of 280 active members, twenty honorary members and eight life members. Despite the general depression almost universally prevalent the past year, our membership lists were increased by the addition of twenty-one active members, one honorary member and one life member. The quality of our membership is reflected at all of the most important local as well as national exhibitions, where our membership is always represented in all the principal classes and usually carry off many of the highest honors.

During recess the members were entertained by several accounts of the convention of the National Association of Gardeners of America, recently held at Philadelphia, Pa. The banquet, leading seed houses and some of the fine private estates were discussed. All reported a pleasant and profitable visit. The usual monthly exhibition was of marked superiority.

The judges made the following awards: For roses, Mrs. Geo. Shawver, from Anton Peterson, a cultural certificate, also a vote of thanks for a fine vase of carnations "Matchless."

A cultural certificate to Thos, Ryan for vase of poinsettias, and vote of thanks for a vase of carnations.

Vote of thanks to Robert Grunnert for vase of carnations White Enchantress.

A. Wynne for a fine vase of carnations Sport of "Harlowarden" vote of thanks.

Vote of thanks to Jas. Foster for display of potatoes, Carman No. 3, also for vase of poinsettias and display of greenhouse grapes "Gros. Colmar." Narcissus Grand Soliel d' Or from P. W. Popp was awarded a vote of thanks.

A feature of the next meeting will be an illustrated lecture by an eminent authority. The subject will be, "The Conservation and Protection of Our Migratory Birds.' subject is an interesting one, and we anticipate a good attendance. Special cash prizes will be offered for 18 cut blooms of carnations, 3 varieties, 6 blooms of each, This competition will be held at our next meeting, January S, 1915.

P. W. POPP, Corresponding Secretary.

#### TUXEDO HORTICULTURAL SOCIETY.

The regular monthly meeting of the Tuxedo Horticultural Society was held in the Parish House on December 2. President David MacIntosh in the chair. There was a large attendance of members present. The nomination of officers for 1915 were taken. A letter was read from the secretary of the National Association of Gardeners as to how they intended to proceed with the co-operation of the different horticultural societies. The members of this society pledged themselves to give this movement all the support they can in the betterment of gardening in general.

Mr. James MacMachan addressed the meeting on flowering shrubs, it being one of the best lectures the society has had for some time. Mr. MacMachan did his subject justice, going very minutely into the different species and their many varieties showing the advantages and disadvantages of massing and single planting of each kind and showing the use of some varieties, not only as flowering shrubs but also for their Mrs. Taylor; 2nd, Eugene Meyer, Jr., sofine colored foliage in the fall of the year. Mr. MacMachan was extended a rising vote of thanks for his instructive lecture.

The next meeting being our annual business meeting will be held on January 6, THOS, WILSON, Secretary

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

The annual meeting of the Nassau County Horticultural Society was held in Pembroke Hall, Glen Cove, L. I., December 9. President Gaut in the chair. Mr. and Mrs. J. P. Morgan were elected to honorary membership, and two petitions for active membership were received.

A communication was read from A. Fournier. Glen Cove, offering a prize of \$10 to be competed for at our fall show, 1915. The president then presented the Stump & Walter Company's cup, also the Nassau County Horticultural Society's cup (won at the dahlia and mum shows) to Frank Petroccia.

It was decided to hold our annual dinner on January 25, 1915. Judges for the monthly exhibits were Messrs, Lewenden, Fogarty and Gladstone, and their awards were as follows:

Vase of 25 mixed carnations-1st, F Honeyman.

Twenty-five Brussels sprouts 1st. T. Twigg. One cauliflower—1st, F. Petroccia. For exhibition of 3 cauliflowers—Certificate of culture awarded to F. Petroccia.

The treasurer then read the financial report, which was very favorable.

Election of officers being next in order. President Gaut called upon Mr. Duthie to take the chair and conduct the election and installation. Result of election--President Ernest Westlake; vice-president, James Me-Carthy; treasurer, Ernest J. Brown; recording secretary, Harry Jones; corresponding secretary, James Gladstone; trustee for three years, James Duthie. Executive Committee Wm. Gray, James McDonald, Angus McGregor, Geo, Ashworth, Jos. Adler, John Fogarty and Robt, Jones, JAMES GLADSTONE.

Corresponding Secretary.

#### NORTH WESTCHESTER HORTICUL-TURAL AND AGRICULTURAL SOCIETY.

The twelfth annual show of the North Westchester Horticultural and Agricultural Society was held in Mt. Kisco, N. Y., October 30, 31, November 1, and was, as usual, m to the mark in competition as in former years. Following is a summary of the awards, the judges being Mr. Jenkins. Lenox. Mr. Augus, Chapinville, Conn., Mr. A. Brill. Pawling, N. Y., and Mr. Johnson, Glen Cove,

M. J. O'BRIEN, Secretary.

#### A CORRECTION.

In the October issue of the CHRONICLE an error appeared in the report of the New Jersey Floriculture Society's Dahlia Show, giving the name of Alfred Thomas as gardener to Mrs. Arthur J. Moulton. Arthur W. Jackson is head gardener of the Moulton estate, and was the successful winner of the first prize for a model garden. He also received cultural certificate for a display of petunias, for Celosia, "Pride of Castle Gould,"

## Senator Johnson's House at Hackensack, N. J.

THE particular feature of this very attractive house to which we want to especially call your attention is, that (lth auch of curved cave construction, the usual introduced little wall vents are not used; but there is a full row of side ventilating sash above the sill. It has been persistently and insistently claimed by other concerns that this could not be done with a curved cave

house "without making it look like a cobbled-up, botched job."

It would seem from this house of Senator Johnson's that we can do it in a thoroughly practical way without detracting from the attractiveness of the curved eave.

We would like to explain to you the neat, effective way it is done. You are welcome to our catalog.

> Madison, N. J.

We were awarded a Gold Medal for our display of Sweet Peas at the American Sweet Pea Society's Exhibition. Museum of Natural History, New York City, June 27th and 28th, 1914.

# THE BEST NOVELTY SPENCER SWEET PEAS FOR 1915

- **BOADICEA.** A giant opal pink, delicately suffused pale cattleya mauve. The flowers are of great size and substance, and beautifully waved; a very strong grower, and always abundance of four bloom sprays. A gem for exhibition. (Very scarce.) Pkt. 30 cts.; 4 for \$1.00.
- BOBBIE'S FRILLED PINK. One of the most charming Sweet Peas ever raised. It is a Duplex form of Countess Spencer at its best. A distinct novelty, which will amply repay a little extra care. Pkt. 25 cts.; 5 for \$1.00.
- DON ALVAR. Grown side by side with all the best lavenders, Don Alvar was acknowledged by experts to be the best lavender yet seen. There is no difficulty in getting four and five flowered sprays. (Seed scarce.) Pkt. 30 cts.: 4 for \$1.00
- HELEN PIERCE SPENCER. Now fixed in true Spencer form. It is a most attractive flower and reminds one of a blue mottled Gloxinia. The ground color is white marbled and penciled with bright blue in thin lines on both wings and standard. The vines are vigorous and produce an abundance of strong stems, carrying invariably four large blossoms. Pkt. 25 cts.; 5 for \$1.00.
- JESSIE CUTHBERTSON SPENCER. Those grow ers who like a good stripe in their collection—and one or two are necessary in every collection-will welcome this grand addition. In the days of popular Grandifloras Jessie Cuthbertson was the favorite stripe, and our efforts to produce a Spencer form of this variety have now been rewarded with a fine large vigorous flower. The ground color is rich cream overlaid with stripes and marblings of bright rose pink. Both standard and wings are alike colored and the whole effect is bold and pretty. Pkt. 25 cts.; 5 for \$1.00.
- MARGARET ATLEE. This was a leading novelty last year and it has proved to be a great favorite. The color is warm salmon pink, perfectly suffused over a cream ground. The cream deepens into bright buff at base of standard and wings and this lights up the flower with great effect. The shade of pink found in Margaret Atlee is entirely a new shade and commands admiration. The flowers are of extraordinary size and many flowers measure two and one-half inches across the standard.

This variety bears a large proportion of duplex flowers, which greatly adds to its effectiveness. Margaret Atlee gained a Certificate of Merit from the American National Sweet Pea Society. Silver Medal, National Sweet Pea Society of Great Britain, July, 1914. Pkt. 25 cts.; 5 for \$1.00.

MONTESUMA. This is considered to be a great improvement on Senator Spencer. The flowers are a more pleasing color, being striped with reddish maroon, the base of the standard showing a touch of orange; a good grower, producing four flowered sprays in abundance. Pkt. 30 cts.; 4 for \$1.00.

NEW MARGARET MADISON. In New Margaret Madison we have a greatly improved strain of the popular lavender color found in our variety Margaret Madison. The size of the blossom has been almost doubled and the form of the flower is now all that could be wished for in a Spencer Sweet Pea.

The color, too, is daintier and prettier and is as near a true lavender as one could wish. The vines are very vigorous and the bold flowers are borne on long, stout stems and usually four blossoms to each stem. New Margaret Madison and New Miriam Beaver make a delightful soft color combination. Pkt. 25 cts.; 5 for \$1.00. NEW MIRIAM BEAVER. Many and varied are the shades of pink in Sweet Peas, but in New Miriam Beaver we have an entirely new and distinct shade of pink. It is the daintiest and most pleasing shade of pink yet discovered in Sweet Peas. The color is hard to determine, but we think that a soft shell salmon pink on cream ground lightly overlaid with soft hydrangea pink would convey a good idea of its uniqueness.

The color is evenly distributed over both stand-

ard and wings and is very light and pretty. The flowers are large, nicely waved-often du-

plexed—and beautifully placed on long stout stems. All other pinks look "heavy" beside this delight-New Miriam Beaver will be the ladies' favorite wherever Sweet Peas are grown. Pkt. 25 cts.; 5 for \$1.00. NORVIC. This is one of the largest flowered and

best strains of White Spencer Sweet Pea yet introduced. The blooms, which are of extraordinary size, are exceptionally well waved. It is quite fixed in character. Pkt. 20 cts.; 6 for \$1.00.

ORANGEMAN. A very fine large-flowered variety of true Spencer form. Color a rich, deep orange, beautifully waved. A very strong grower and equally good for both exhibition and market. Pkt. ; 6 for \$1.00.

ROBERT SYDENHAM. (Holmes.) most individual colors introduced into the modern Sweet Pea. It is a bright orange salmon self-colored, rather lighter than the Stirling Stent and deeper than Melba or Barbara. It is of immense size and owing to its soft texture needs a little shading during the middle of the day. It is a grand acquisition and created a great sensation when exhibited at the Great Annual Exhibition in London.

20 cts.; 6 for \$1.00.

ROSINA. One of the largest Sweet Peas yet intro-duced. The standard and wings are a bright rosy heliotrope, with a distinct wire edge of solferino red on a cream ground, which is particularly effective and distinct from anything seen in Sweet Peas. On account of its pleasing and taking color, it has been greatly admired wherever exhibited, and is sure to be a very popular variety. Besides being such a vigorous grower, the flowers are of Besides being extraordinary size and well frilled of the true Spencer type, with abundance of four and five flowered sprays; will make a striking bunch for exhibition. Rosina was the leading novelty that helped to win the Silver Cup for new varieties at the National Sweet Pea Society 1913 Show. Pkt. 30 cts.; 4 for \$1.00. ROYAL PURPLE. This we consider the best Nov-

elty seen last year. It was shown at the National and other Shows by Mr. R. Wright of Formby, and attracted a lot of attention on account of its fine royal purple color, great distinctness, and size. Duropinion we formed of it last year, and has been very generally admired. Awards of Merit, Royal Horticultural Society and National Sweet Pea Society, 1914. Pkt. 25 cts.; 5 for \$1.00.

VEILED BRIDE. This is a charming novelty, and is now perfected and fixed. The ground color is white, daintily flaked and marbled with soft rose pink. The wings and standard are alike colored. The form of the flower is all that could be desired. the standard being nicely waved, round and bold. When a bunch of this variety is gathered one must call it "Sweet," the delicate markings of pink being daintiness itself. Pkt. 25 cts.; 5 for \$1.00.

# The Relation of Birds to Parks

By L. P. Jensen, Missouri.

The rapid diminishing of our forest areas, and the extensive cutting out of, and destruction of, undergrowth in the remaining woods, leave few places for the nesting and protection of our valuable native birds. We are beginning to realize that the value of our birds is not only an æsthetic one, vis: their beautiful song and wonderful color, which alone would be sufficient reason for their preservation and protection, but a question of unusual economic importance.

When we look into the reports telling of the destruction caused by insects injurious to vegetation, and come to realize what a large number of obnoxious insects are exterminated by even one pair of insectivorous birds during a single season, the question of their protection be-

comes of vital importance to all of us.

Foremost and among the ones particularly fitted to take up this missionary work of protection and preservation of our beautiful and valuable feathered denizens of the air, water, woodlands and meadows, are the superintendents of public and private parks, estates and reservations, because the increase in number of insectivorous birds may mean the saving of many species of trees and other plants, on which the value of our parks and woodlands in a large measure depends.

It is not a hard nor expensive proposition to greatly increase the number of birds, in any given locality, when we once realize that the birds will stay wherever the conditions are such that suitable nesting places, food and

water are to be found.

The preservation of our native plants in their natural environments, the encouraging of undergrowth in our woodlands, the prevention of destruction of native plants in places not adapted to agriculture, and the replanting of waste land created by thoughtless destruction of native plants, is a work which the park and estate superintendent is particularly fitted to perform and encourage.

The accomplishment of this work would mean: First, the preservation of the wonderful scenic beauty of our country; second, the increase of our useful native birds, and third, through the increase of birds, a decrease of obnoxious insects, not to speak of the protection of numerous species of mammals, now on the verge of ex-

The following list, giving the nesting places of some of our common useful birds, may be of value as a guide to those who wish to attract them, by providing or preserving proper conditions for the establishing of their homes. which is the first and most important step to be taken, if we wish to have them remain and increase in number:

Birds which build their nests in deciduous trees: Red-

eved vireo, warbling vireo, yellow-throated vireo, cedar waxwing, scarlet tanager, American goldfinch, Baltimore oriole, orchard oriole, wood pewee, kingbird, hummingbird, robin, morning dove, and herons. To these we may add most of those which build in boxes, who generally build their nests in hollow trees and cavities.

Birds which build their nests in shrubs and low trees: Brown thrasher, catbird, vellow warbler, American redstart, rosebreasted grosbeak, least flycatcher, cuckoos, indigo bird, chipping sparrow, tree sparrow, wood thrush

and red-winged blackbird.

Birds which build their nests in coniferous trees: Golden-crowned kinglet, black-throated green warbler,

myrtle warbler, purple finch and blackbirds.

Birds which build their nests on the ground, or very near the ground: Wilson thrush, owen bird, black and white warbler, towhee, partridge, song sparrow, slatecolored junco, field sparrow, meadow lark, quail, bobolink, pheasant, spotted sandpiper, woodcock, nighthawk, whippoor-will, bank swallow and rail.

As tidiness and the health of woodlands often demand cutting out of trees containing hollows and cavities suitable as nesting places for some of our most valuable insectivorous birds, it becomes essential to provide artificial

nesting places for them.

Farmers' Bulletin No. 609, "Bird Houses and How to Build Them," by Ned Dearborn, gives detail information about the construction of bird houses, to suit the habit of the various species, and those who desire to build their own bird houses are referred to this publication, which may be obtained free from the Division of Publications of the United States Department of Agriculture, Washington, D. C

Various kinds of bird houses are manufactured and

may be purchased ready made.

For the sake of their appearance in the landscape, bird houses should be constructed of material in harmony with the scene, of which, when placed, they become a part,

and be as inconspicuous as possible.

The following birds will build their nests in boxes or bird houses: The bluebird, robin, chickadee, tufted titmouse, white-breasted nuthatch, dipper, tree swallow. barn swallow, martin, song sparrow, phaebe, crested flycatcher, flicker, woodpecker, screech owl, barn owl, and wood duck.

Modern architecture leaves few nesting places for those birds which formerly inhabited the barns and buildings of the early settlers, whose construction provided many hollows for the homes of phaebes, barn swallows and cliff swallows. The modern designer of park structures ought to provide some accommodation for these valuable insect exterminators.

For those birds which come early in the season, before an abundance of their natural food is to be found, or for those which remain with us during the winter, when snow and ice cut off their natural food supply, food must

be provided, if we wish them to stay, or they will migrate to places where food is to be found, or perish.

Suet should be hung on the branches of trees and seeds, grain or other suitable food placed where it may be

found by the birds.

Boxes may be made or bought for this purpose. Berrybearing trees and shrubs should be planted in abundance wherever possible for the accommodation of the birds, as well as for their æsthetic value of brightening the landscape in winter and summer.

Coniferous trees are valuable to protect the birds from

cold and from their enemies.

Where the natural supply of water is not abundant it should be liberally provided. Shallow pans are valuable for this purpose.

The most serious enemies of the birds are:

First—The small boy with a rifle. He should be converted by education. Second—The stray cat. Should be exterminated. Third—The English sparrow. Should be caught by traps and utilized as food. Fourth-The red squirrel. Should be kept checked so as not to become too numerous. The gray squirrel should not be considered as an enemy of birds; in most localities the gray squirrel needs protection from extermination.

Hawks, owls and other birds of prey should not be condemned, for while they undoubtedly do some damage, this damage is generally more than repaid by their perpetual destruction of mice, rats, shrews, moles, rabbits,

weasels and English sparrows.

Societies such as The American Association of Park Superintendents, The Society of American Florists, The National Association of Gardeners, and others, whose object is the protection of plants from the ravages of insects, and their cultivation for ornamentation and use, should have committees on bird protection.

It is not the object of the writer to go very deeply into this interesting, useful and fascinating subject, but an attempt to induce the reader to take a hand in this work, the success of which needs the personal effort of all

thoughtful persons.

The following list of a few of the best books on this

subject may be of value:

E. H. Forbush, "Useful Birds and Their Protection," published by the Massachusetts State Board of Agriculture, Boston, Mass.

"Bird Houses and How to Build Them," by Ned Dearborn, Farmers' Bulletin No. 609, U. S. Department of Agriculture, Washington, D. C.

Wm. H. Hornaday, "Our Vanishing Wild Life." Pub-

lished by the New York Zoological Society.

Chester A. Reed, "Bird Guides," published by Doubleday, Page & Co., Garden City, N. Y. Valuable for the identification of birds.

#### ORCHID NOTES.

It has been almost a century since Cypripedium insigne was first introduced; now it is as common as it is old. The cultivation of it is comparatively simple or it would not survive the very rough treatment that this orchid often receives. Somehow C. insigne always seems to be in the way, consequently, they must be moved from place to place to make room for some plants that are thought to be of more importance for the time being, and eventually they are carried out of doors to be placed in cold frames for the summer, says a contributor to The American Florist.

There certainly is no need for treating cypripediums roughly considering the attention they require and the space they occupy; any neglect of needed attention is shown by the flowers produced, only too often are they kept in the summer quarters too long, or placed in a very cool greenhouse for the sole purpose of retarding the flowers, which only results in securing a crop of useless short-stemmed blooms. There are quite a number of the green-leaved cypripediums that are good for florists' use, but in addition to the above variety, C. Leeanum, C. Nitens and C. Villosum are best for winter use, and with only ordinary watchfulness will thrive in a cattleya house, and they will also succeed in a house suitable for carnations providing they are given sufficient shade during summer. This they need under any considerations; either permanent shading on the glass, or blinds of some description.

I's Courtesvol . VASE OF CYPRIPEDIUMS AND ASPARAGUS

These terrestrial orchids do not require repotting very often, for the finest flowers are procured from pot bound plants, but when potting does become necessary, use a compost of solid lumps of peat, fibrous loam and sphagnum moss in equal parts. The pots need to be filled quarter full of broken crockery for drainage, and see that the plants are not set too deep into the pots (the base of the leaves should be level with the top of the pot), place the compost firmly round the plant, water sparingly for some time afterwards, but spray them often, and keep the surroundings damp to maintain a nice growing atmosphere at all times. The summer flowering varieties such as C. Lawrenceanum, C. barbatum and C. callosum, with many others have mottled leaves and they require a little warmer treatment than those having green leaves.

# Problems in Reforestation

By Arthur Smith, Pennsylvania.

Reforestation problems divide themselves broadly into three main issues. The planting of forest trees (1) upon land which has not, at least for several generations, been in forest before and which is of no real use in an agricultural sense; (2) forest land from which lumbering operations have cleared away more or less all trees and upon which there is no natural renewal taking place, and (3) land upon which the entire growth has been destroyed by fire. The latter, especially in the case of coniferous forest, generally presents the most difficult problem, the more so the steeper the slope of the ground, because where hillsides have been denuded of growth, from any cause, either fire or lumbering, for a greater or less number of years, erosion is causing the removal of the soil in which trees can grow, and it is only a matter of time when these areas will become impossible to reforest.

It is not difficult to imagine the condition of things when the closing of the glacial period removed the ice cap back to the arctic regions. At that period the entire earth which had been covered by this ice cap must have been absolutely devoid of plant life. How many thousands of years elapsed from the first subsequent appearance of plant life in the form of lichens to the time when forests came into existence, we have no means of knowing, but the point to be borne in mind is, that thousands of acres of mountain and hillsides are now rapidly reverting to the conditions which prevailed at the close of the ice age, and therefore the longer reforesting is delayed the more difficult it will be to carry out.

Ultimate success in forest planting depends upon securing a canopy at the earliest possible date; this is

brought about by the density of growth.

Density may be defined as the thorough shading of the ground by the forest crop. In a wood of good density the layer of fallen leaves is protected from sun, wind and heavy rain, which would rot it too quickly or wash it away; it lies upon the ground as a mulch, slowly rotting and turning into food for the trees, and its quantity is kept up and even increased by the annual fall of leaves. In this way the soil is maintained sufficiently fertile for the trees to thrive. As a rule dense or crowded woods keep up their own density; thin or open woods, not ripe for lumbering, should have their density increased by underplanting. Density depends chiefly upon the number of trees, but partly also upon the thickness of their crowns. The best density is usually found where trees are doing well; upon poor soil in exposed sites, although there may be more trees per acre, the density is rarely so good. Therefore trees should be planted closer upon poor soil, especially on hillsides, than where the soil is better and more level. I know there is a difference of opinion upon this point. A forester, who had graduated from a college of forestry, once told me he had been taught there that trees should be given more room upon poor soils than upon richer ones. But it is obvious that the loss of fertility owing to insufficient shading of the ground had been left out of consideration and the importance of obtaining a canopy as soon as possible entirely lost sight of.

Canopy may be called the roof of a wood; without it there is no density. Young trees are said to form canopy as soon as their branches meet. At this period the branches are resting upon the ground and all

growth, excepting that of the trees themselves, is practically smothered. As the trees push upward their lower branches die from want of light, their stems clear themselves and the canopy rises until it is many feet above the ground: a more or less flat roof supported upon smooth clean stems as upon pillars. Without density tall clean trunks are impossible, as it causes the branches to die off before they become large enough to form knots. A straight log free from knots will invariably have a greater value than one double the size that has been given room enough to produce more or less thick branches.

The object of underplanting thin or open woods is to improve their canopy. This underplanting should consist of species which are more or less shade-bearers, those liking shade the least being planted in the most open spots. Among deciduous species beech will stand more shade than any, and of the conifers white pine, is probably the best shade-bearer, although in Europe the silver fir takes the first place in this con-

nection.

With the idea of obtaining a canopy earlier when the entire ground has to be planted, what are called "nurses" are sometimes used which are cleared away before they interfere with the growth of what is intended to be the crop species. The nurse trees in the case of conifers may be a species saleable for Christmas trees, in which case they often bring in sufficient cash to pay for the expense of reforesting up to that time. Where the ground to be planted is naturally covered with weeds and shrubs these act to a considerable extent as nurses, care being taken to see that the young trees are not smothered; the latter is, however, necessary in all cases. The removal of nurse trees should be done gradually and first from that portion of the planting which is the most thrifty, that is, where the crop species are making the greatest growth. Where hardwoods are planted for the main crop, larch makes a good nurse. The Japanese species has of late been planted pure in many parts of the Eastern States, but the European is considered more drought resisting, although they are neither suitable for very dry soil.

The use of nurses is not absolutely necessary, as the planting of one species more thickly than is required for a permanent crop answers the same purpose, provided thinning is done at the right time. If the earlier thinnings are of no value the benefit to the main crop from close planting more than pays for the extra

expense.

În notes of this kind one can only deal with general principles, as correct methods of carrying out details always depend upon local conditions.

#### OUR COVER ILLUSTRATION.

The illustration on our front cover page is a reproduction of a photograph of the garden of palms, under glass, in the Missouri Botanical Gardens, St. Louis, Mo. We have been fortunate in securing a photographic collection of the new conservatories in Shaw Garden, Missouri Botanical Gardens, never before published, which we shall present to our readers in the February issue of the Chronicle. The range of glass at Shaw Garden is considered one of the most interesting of any public institution in this country and, when finally completed, it will be one of the finest ranges of its kind in existence.

# Practical Tree Surgery\*

By J. Franklin Collins, Washington, D. C.

Tree surgery, or, more properly, tree repair work, is not a mysterious art known only to a favored few who alone are fitted to undertake it. It can be undertaken by any careful man who has a good general knowledge of the structure and life history of a tree, its normal manner of covering wounds, and how insects and decay organisms cause damage, provided he can handle a gouge and mallet, a saw, and a tar brush and applies in a practical manner his knowledge of the anatomy of a tree, together with a generous admixture of good common sense. For work in the tops of trees he will also need a clear head and ability to climb. Many tree owners and many persons in charge of private estates are well qualified to undertake tree surgery if the requisite time is available and they will familiarize themselves with the fundamental principles and operations underlying the work, at least to the extent presented in this article.

It is no easy matter to find a place where the well-worn phrase "prevention is better than cure" could be applied with greater appropriateness than in connection with tree surgery. Ice or wind may break limbs or uproot trees which injure others as they fall. Horses commonly gnaw away portions of the bark of street trees unprotected by tree guards. Telephone, telegraph, and electric linemen with their climbing spurs and saws are notorious mutilators of shade trees, especially in towns where the trimming of trees is not regulated by law. Poorly insulated electric wires of high voltage often discharge heavy currents through the trees. Wheel hubs frequently tear away large pieces of bark. After a few years, decay may penetrate into the interior of the tree from any or all of these injured places. This decay may increase from year to year until large limbs, or the trunk itself, become so weakened that they are easily broken by violent storms. It requires comparatively little time and expense to clean and paint a fresh injury. It often requires much time and expense to treat properly the same injury after it has been neglected for a few years.

The most economical and reliable remedy for a decayed area consists in attending to an injury as soon as it is made, perhaps 20 or 30 years before it becomes a menace to the tree. This fact should never be forgotten by tree owners or persons who are charged with the care of trees. If put into practice, it will insure a profit of many hun-

dred per cent on the original outlay.

In its simplest type, tree surgery, as it is popularly understood at the present time, consists in removing dead or decayed limbs or stubs from a tree and treating the scar with an antiseptic and waterproof covering to prevent decay while healing. Another type consists in cutting out the decayed and diseased matter in trees and filling the cavities with cement or other material to facilitate the normal healing-over process. This is often referred to as "tree dentistry," a term which very aptly indicates the character of the work. Filled cavities do not increase the strength of the trunk or limb to the extent that is generally supposed.

The work on dead or diseased branches can be regarded as comprising but two essential operations: (1) Removing the branches in a manner that will prevent injury to the surrounding bark and cambium, which is the thin and usually watery layer of young tissue located between the bark and wood of all healthy parts of a tree, and (2) sterilizing and waterproofing the scars.

\*From Angelein Fliestr

A large limb should never be removed by sawing through from the upper side, as this usually strips the bark and wood below the scar. The proper way is to make the first saw cut on the under side, from six inches to a foot beyond the point where the final cut is to be made. It should reach from one-fourth to onehalf through the limb. A good time to stop cutting is when the saw becomes pinched in the cut. The second cut is made on the upper side of the limb, an inch or two beyond the first one. This is continued until the limb falls. After the limb has fallen, a third cut is made close to the trunk and in line with its woody surface. When nearly sawed through, the stub must be supported until completely severed, so as to avoid any possibility of stripping the bark below as it falls. The first and second cuts to prevent stripping may be omitted when small limbs which can be held firmly in place until completely severed are being cut.

When the scar is not naturally pointed above and below, it is a good practice on most trees to remove a short triangular piece of bark from the upper edge of the scar and another from the lower edge, so as to anticipate its dying back at these points. This makes the scar pointed at both ends, the most favorable shape for healing. It is important that some good shellac be applied with a suitable brush over the edge of the bark, especially the cambium, immediately after the cut is made. If the scar is a large one, it is a good plan to use the knife for one or two minutes and then shellac the freshly cut surfaces, repeating the operation until all the bark around the scar has been shellacked. The full benefit of the shellac will not be achieved if many minutes elapse between the cutting and the shellacking, unless the freshly cut sur-

faces are visibly moist with sap.

If necessary, the woody surface of the scar may now be smoothed off with a chisel and mallet to conform in general shape with the tree trunk. It is bad practice to

leave a stub projecting from a trunk.

The final operation is to sterilize and waterproof the surface of the exposed wood and bark. For this purpose many preparations have been used. Recent extensive tests by specialists in timber preservation indicate that some of the creosotes stand far ahead of all other tested preparations in their power to destroy and prevent the growth of certain wood-destroying fungi and that ordinary creosote, although it does not head the list, is far better than other preparations except some of the less known and less available creosotes. Furthermore, creosote penetrates the wood better than a watery antiseptic. In using commercial creosote, it can be applied with an ordinary paint brush over every part of the exposed wood. The entire shellacked and creosoted surface must finally be waterproofed by painting it with heavy coal tar. A single application of a mixture of creosote and coal tar (about one-fourth or one-third creosote) has been quite extensively used with good results. Although one coating of this mixture may at times be sufficient, it is always safer to follow it with a heavy coat of coal tar.

Permanent waterproofing can be secured only when the treated surfaces are watched from year to year and recoated when any tendency to crack or peel is observed. This is an important step, which is almost invariably neglected by tree owners and tree surgeons.

During the last few years there has been a widespread

popular interest in the treatment of decayed places in old trees. This type of work can be regarded as comprising three essential operations: (1) Removing all decayed and diseased matter, (2) sterilizing and waterproofing all cut surfaces, and (3) filling the cavity in a manner that will favor rapid healing and exclude rot-producing

organisms.

The necessary tools for digging out decayed matter are few. As a rule, two outside-ground socket-handled gouges (one with a curved cutting edge of about three-fourths of an inch and the other, perhaps, one and one-half inches), a chisel, a mallet, a knife, and an oilstone are sufficient for ordinary work. The gouges, chisel, and knife should never be used near the cambium when they lack a keen edge, as dull tools will injure it. In cutting out deep cavities, longer interchangeable handles for the gouges may be necessary.

Usually an old decayed spot may be partially or wholly covered by a new growth of wood and bark at the edges and the visible decayed area be small as compared with that which is hidden. In such cases it is usually necessary to enlarge the opening with the gouges and mallet in order to make sufficient room in which to use the gouges in the interior. This opening should be sufficiently long to reach all the decayed and diseased heartwood with

little or no additional injury to the tree.

If the decayed and diseased wood extends some distance above or below the external opening, it is a common practice to cut one or more holes above or below the main opening in order to facilitate the removal of the diseased wood. This results in one or more bridges of wood and bark spanning the long interior cavity. This practice is of doubtful value, partly because it is often impossible to see whether the diseased wood has been entirely removed from the under side of the bridges, but mainly because there is a strong tendency in most trees for the bark and sapwood of the bridges to die and decay as a result of severing the sap-conducting tubes both above and below. If the holes are pointed above and below, there is less trouble from this source. A practice that permits a more thorough cleaning out of the cavity is to make a narrow opening, pointed at both ends and sufficiently long to include all the diseased wood. This often extends some distance above and below the visible discolored area.

The most important feature of this stage of the work is to remove all the diseased and insect-eaten wood. This excavating must continue on all sides of the cavity until sound, uninfected wood is reached. All discolored or water-soaked heartwood should be removed, as this is the region in which the rot-producing fungus is most

active.

Another important point to be borne in mind in shaping a cavity that is to be filled is to have the sides undercut if possible, so as to hold the filling firmly in place. Care must be taken, however, not to have the wood at the edges of the opening very thin, as this promotes the drying out of the bark and sapwood at these points. Ordinarily the edges should be at least three-fourths of an inch thick; an inch and a half would be better.

Great care must be exercised in working around the cambium, and all cutting tools must be kept very sharp. The final cutting along the edges of the bark and sapwood can usually best be made with a very sharp knife. This cutting must be followed immediately by a coating of shellac, which should cover the edges of both bark

and sapwood.

Before cementing a long cavity it is advisable to place through it one or more bolts, so as to hold the wood and cement more firmly in place. A cavity two feet or less in length will not usually require a bolt, but long cavities, as a general rule, should be bolted every 18 to 24 inches. Oftentimes a single bolt can be placed so as to support both sides. In certain cavities it may be necessary to place bolts at different angles. In any case a strip of uninjured cambium at least an inch wide should be left between the edge of the cavity and the bolt. On medium-sized trunks, after deciding where the bolts can most efficiently be placed, a very sharp half-inch bit, sufficiently long to reach through the trunk and cavity, can be used to bore the hole for the bolt. On large, heavy trunks a larger bit should be used. Heavy oval or round iron or steel washers, about three times the diameter of the bolt, should be countersunk into the wood by carefully cutting away the bark at both ends of the hole with a sharp gouge or chisel.

All split cavities must be securely bolted, particularly near the upper part. If the split comes from a crotch, all decayed and diseased wood should be removed from the split and creosote and tar applied, after which it can be bolted just beneath the crotch, so as to close the crack or at least bring the parts back to their normal position in case decayed matter has been excavated from the crack. If the split is a recent one, a washing of creosote only will usually be sufficient before drawing the sides together with bolts. Under certain conditions, particularly in large trees, it may be necessary to use a rope and tackle blocks to pull the limbs together some distance above the crotch, in order to properly close the crack before bolting it

If the cavity has a comparatively large opening or has little or no undercutting, it is the custom to drive flatheaded wire nails into the wood in the interior in order to hold the cement filling firmly in place. In medium-sized cavities nails two and a half or three inches long are usually driven into the wood for about half their

length.

After the decayed and diseased matter has been completely excavated and the edges of the sapwood and bark shellacked, the next step is to sterilize the interior of the cavity in order that all germs of disease or decay which are present may be killed and that any which may come in contact with the cut surfaces during subsequent operations may be destroyed. As already stated, creosote appears to be one of the best preparations to use. Every cut part of the wood and bark must be creosoted, and over this a heavy coating of tar or hot asphalt should be applied before the cavity is filled.

A good grade of Portland cement and clean, sharp sand free from loam (1 part of cement to 3 or less of sand) should be used. A quantity of dry cement and sand sufficient to fill the cavity should be thoroughly mixed before the requisite amount of water to make a rather stiff mortar is added and the whole mixture worked to an even consistency. In large cavities fine gravel free from loam is sometimes substituted for the sand.

For placing the mixture in the cavity a mason's flat trowel and an ordinary garden trowel with a curved blade will be found convenient. A tamping stick, I or 2 inches thick and I to 3 feet long, according to the size of the cavity, will be needed; also some rocks and a pail of water if the cavity is a large one. A layer of cement 2 or 3 inches deep can now be placed in the bottom of the cavity with the garden trowel and tamped firmly in place. This operation is repeated until the cement is 8 to 12 inches thick. Wet rocks of various sizes may be embedded in the cement provided they do not reach within an inch or two of its outer face. If the mixture is too wet, it will tend to run out of the cavity under the operation of tamping. If too little water has been used, it will not pack down promptly. The top of the 8 to 12-inch

(Continued on page 20.)

# Vegetables From the Home Garden

By W. N. Craig,\* Massachusetts.

Horticulture has its full share in the ceaseless activity of the present age. Changes in the vegetable garden, the varieties grown, and methods of culture show just as great changes as are to be witnessed in the present improved methods of locomotion, lighting or sanitation. There have been, within the last twentyfive years, particularly striking improvements in potatoes, peas, tomatoes, beans, and in fact, all standard vegetables. There are now practically no periods in the year, even in midwinter, when a good assortment of vegetables, either of greenhouse or Southern outdoor culture, is not obtainable.

We hear much nowadays of trusts, and the high cost of living is dwelt on, not only here, but in practically every civilized community on earth, and a late President suggested an international tribunal to consider the causes of high prices and suggest remedies. Perhaps the most practical remedy which could suggest itself would be for more families to plant fruits and vegetables in their home gardens. The European countries are far in advance of us in this respect; there, every workingman who has the least ambition, rents a piece of ground if he has none attached to his home, and grows a fine variety of vegetables; in Great Britain, large numbers of workmen even have small greenhouses in their gardens, in which to grow a few flowers and early vegetables, and start their seedlings in. It should be possible for many to have modest greenhouses here; they need not necessarily be heated through the winter, but utilized for starting early plants for the home garden, both flowers and vegetables. Where a greenhouse is not possible, it does not cost much to have a cold frame with two or more sashes, which can be used as hot-beds for starting tomatoes, celery, lettuce, egg plants, cabbages and other plants. It is simply astounding that so many residents in these United States prefer to buy their vegetables the year through, when they, in many cases, have facilities for raising the same at home. We see many fine homes with their lawns and shrubs, veritable Queen Anne fronts, but too often, alas! what we might say, "Mary Ann" backs. For it is too true that beyond collections of junk, ashes, and other rubbish, what might be in many cases a garden of utility is only an

Vegetable gardens should always, if possible, be made where they can get a warm, sunny exposure; if sloping south the crops will be earlier, but this is not essential. Vegetables will grow well in almost any soil in which water does not stand. Such soils require drainage to produce good crops; drainage warms as well as sweetens the soil. The best manure for nearly all vegetables is well rotted cow manure or horse manure, if applied and worked in. In the fall, fresh manure can be used to advantage, but it is better not to use such when near planting time. It is always well to save and bury as much of the humus or vegetable matter as possible; too often this is thrown on

the rubbish heap.

In considering any general order for work in the vegetable garden the leading principle should be that its productive powers should be taxed fully. There need be no resting of the ground, and it is very easy if there should, perchance, be a surplus of any crops,

"Extracts from purey is a herore Horncultural Society of New York, January 20, 1915.

to give them away, and in the case of the Brassica family, to return them to the soil for manure. Hard cropping, of course, is not possible unless the land is liberally manured and the surface soil kept constantly tilled. To put little in and take out much means virtual exhaustion; a whip will not work as a substitute for corn for a horse with hard work to do; nor will a candle burn long if lit at both ends. Always dig deeply, and when occasion will permit trench a couple of spits deep. Change crops from year to year where this can be done; this is not absolutely necessary and it is not always possible to do it, but the majority of vegetables do better with a change of ground.

Soils which are sour or acidy should have a liberal dressing of lime; this is best applied in the fall after the crops have been gathered. Sufficient lime is not used in America; once in three years the bulk of soils are benefited by an application; do not apply the lime, however, at the same time as manure, as the lime will release much of the nitrogen from the latter. Barnyard manure cannot always be procured, but good crops can be produced, with chemical fertilizers alone; these, however, must be used with greater precaution than the manure. Too often fertilizer is used in seed drills, and the seedsmen are blamed for selling poor seed, where the seedings have been practically destroyed by the fertilizer; the safer plan is to broadcast and harrow it in well, also to use it between rows of growing crops to stimulate them.

A list of vegetables of proved excellence and a few words on their culture is apt to be tedious, but there are so many starting a garden each year that something must be said on this subject. These remarks are intended rather for small growers, and not for those who are operating market gardens. The best growers of vegetables are not necessarily market growers or practical gardeners at all. In Great Britain much finer leeks, potatoes, celery and cauliflower are grown by the artisan classes, who take a keen interest in vegetable culture, than by the professionals, and there is no reason why it cannot be accomplished here.

Peas are one of the important vegetables and the first sowing should be put into the ground as soon after it is open as possible. We hear it commonly stated that it is too early to sow peas because the ground has not become warmed. The warmer and drier the soil gets the poorer the peas will do. We have sown these as early as March 10, and in late seasons not until the first week of April; but just as soon as the frost has left the ground it should be spaded and plowed, manured liberally, and a first sowing made; successional sowings can be made until the end of May, after which time it does not pay to sow them, but for a fall crop, a sowing can be made about July 25. Dwarf peas are to be recommended for small gardens; probably the best of these is Sutton's Excelsior; Nott's Excelsior is very good also; both of these are heavy croppers. Later varieties, such as Thomas Laxton, and Gradus, are excellent, but should have good supports. Birch brush is the best support for peas; wire netting may be used where birch is not procurable. Good succession peas to follow those already nama! are Alderman, Dwarf Champion, Sutton's Dwarf D^fiance, Juno, Improved Stratagem, Advancer, Quite Content, and the old Champion of England; the latter should not be grown where it cannot be given good supports, being a tall grower, but it is a very productive variety.

Beans are of much easier culture than peas and will succeed in soils where peas would be an utter failure; they can also be picked over quite a long season; we have picked string beans as early as June 28 and last year as late as October 12, which gives a fairly long season. First sowings of string beans can be made from April 15 to 20, and successional sowings made until August 1 for late pickings. Triumph of the Frames and Plentiful are the earliest varieties we have grown. Stringless Green Pod and Valentine are excellent later sorts. Improved Goddard and Dwarf Horticultural are splendid string and shell varieties. Wax beans are handsome and sell well; their appearance helps them to sell, but their flavor is far inferior to that of the green podded sorts. Rustless golden wax and stringless white wax are reliable varieties. Lima beans should not be sown until we get settled warm weather. The dwarf varieties are of comparatively recent introduction, and for the small grower are far to be preferred to the pole sorts. The earliest of these is the small Henderson Bush Lima; many prefer the flavor of this to all others. Dreer's Lima is a sure cropper in wet seasons. Fordhook Lima is superior to the Burpee's in both size and flavor and will eventually supersede it.

Potatoes are the most important of all garden vegetable crops. They will succeed in a great variety of soils, if proper preparation of manuring has been given, but the best soil is a deep, rich, friable loam, well drained, where there is no possibility of water standing in a wet season. Far more owners of gardens should grow their own potatoes; they cost the average household more money than any other vegetable, and there is nothing difficult in their culture which should deter anyone from planting them. Fresh manure should never be used when planting potatoes; it can, however, be worked in the soil the previous fall; the best plan is to plant them to follow some crop for which the ground was heavily manured the previous spring. Early planting pays the best, particularly so when we get such severe droughts as in the summer of 1911. Rows three feet apart and sets fifteen inches are correct distances. For a very early crop it pays to sprout a few tubers in boxes containing a single thickness of each, stood erect and as close as they can be packed. The general practice is to spread fertilizer in the drills before planting the sets; a far better plan is to broadcast it after the potatoes have been planted. Where fertilizer alone is used, 600 pounds acid phosphate, 500 pounds kainit, and 200 pounds nitrate of soda per acre can be applied, using the nitrate of soda after the growth has started. Small growers had better use some special potato fertilizer.

Differences of opinion arise about cutting sets; we like them to have two eyes each, and such sets from large potatoes are more productive than if cut from small ones. Single potatoes of small size do not average so well as sets cut from large potatoes. The ground should be kept constantly stirred, both before and after the potatoes start to grow, and this must be done very persistently, and particularly after each rainfall. The potato beetle and blight can be controlled by spraying. As to varieties, Early Norwood and Aroostook Pride as earlies, and Green Mountain as a main crop variety are sufficient. If restricted to one variety, it would be the reliable Green Mountain.

The Brassica or cabbage family cannot be omitted from any vegetable garden; all like well-manured land. Excellent cabbages for early are Copenhagen

Market and Jersey Wakefield; for late, Danish Baldhead and Danish Roundhead; these latter are harder and far superior to the Drumhead types. Early cabbage can be started in a frame in March and planted out about April 15. Winter sorts should be sown about June 1. Cauliflowers for an early crop are best grown in a cold frame where they can be watered. For a fall crop, seed should be sown as near May 25 as possible. Kronk's Perfection Erfurt for early, Dry Weather and Snowball for late, are splendid varieties to grow. Brussels sprouts should be sown as soon as the ground is open, and later planted out in rows three feet apart, and two feet between the plants. These are splendid and choice winter vegetables; with the cabbages they should be lifted and heeled in a cool cellar before the frost becomes too severe. Aigburth is a first-class sort, so is Dobbie's Selected. Savoy cabbage is preferred by some to the common cabbage; the culture is the same, and the Drumhead variety the best. Green curled kale or borecole is a very hardy member of the Brassica family, and of very easy culture; heeled in with the cabbages it can be used from February to the last of April, and is superior to the greens brought from the South. It should not be housed until it has had several good freezings.

No garden is complete without tomatoes. are easily raised in the house or cold frame, and if strong plants are set out, fruit may be picked by the middle of July and until killing frost. To secure good tomatoes they should not be allowed to ramble over the ground at liberty, but trained to stakes, fences, or some other support. We prefer to retain two of the bottom laterals, with the main stems, and to rub off all other laterals, also cutting back some of the leaves, especially when the plants are tied up to stakes. Trained plants have many advantages to compensate us for the care bestowed upon them, the fruit is always clean, and readily seen when wanted, ripens better, and has a superior flavor to those borne on plants which are bespattered with soil after every rainfall. Excellent early tomatoes are Chalk's Early Jewel and Lister's Prolific. For a main crop, nothing is superior to the old reliable Stone. Aristocrat and Dwarf Stone are fine dwarf types, excellent for very small gardens. Golden Oueen is the finest of the large yellow varieties. The small fruited tomatoes have of late years come greatly to the fore; for salads, decorative effects, and preserving they are very fine; the finest of these is Yellow Plum; others to be recommended are

Red Cherry, Peach, Pear and Red Plum.

An important crop is sweet corn; no vegetable will withstand severe drought and heat better if persistent culture is given the crop. It succeeds well in either hills or drills, probably in the latter the stalks will not blow over so much during the wet windy weather. The first sowing can be made in a warm piece of ground from April 15 to April 20; even if it is cut down by a late frost, the seed is easily sown again, and the loss is but trifling. The soil for sweet corn should be very rich for best results. Seeds can be sown at intervals of from eight to ten days until July 1, in the case of Stowell's Evergreen, and a few days later with Crosby. We have sown early varieties as late as July 15, and they have yielded an abundant supply of crops when frost held off late. In the way of early varieties, First Crop Sugar, Golden Bantam, Early Cory, and Peep-oday, are all good. In medium earlies we have Golden Dawn, an excellent yellow variety of fine flavor, and the always reliable Crosby; Porter's Excellent is another sort of excellent flavor; of late varieties, Stowell's Evergreen produces the largest cobs, and they

are very tender and sweet, but Country Gentleman, an irregular road variety, has a very delicate flavor.

Melons are not really a vegetable at all, but are served only as dessert fruit. They are, however, always catalogued with other vegetables, and may therefore be fairly spoken of here. During the past few years these, thanks to warm summers, have done extraordinarily well. Early batches can be started in pots or under small hand lights; a sheet of glass 16 by 24 inches over each hill will advance the crop quite a little; these glasses should be removed when rain falls, closed on cold nights, and filtered during the day. It is not a good plan to merely dig out a hole and place a shovelful or two of manure in each hole, giving nothing to the rest of the ground. The better plan is to broadcast, and plow or spade it in; this gives more vigorous plants. The finest flavored melon we have grown is Mrs. H. H. Rogers; other good sorts are Early Christiana, Honey Drop, and Emerald Gem. Rockyford is a great cropper, but we have found the skins rot rather badly just before ripening. The same applies to the big handsome Montreal Market.

Watermelons do well in warm summers; they should not be sown before June 1, and one or two plants only should be left to a hill. Cole's Early, Early Fordhook, Halbert Honey, and Kleckley Sweet, all do well in Massachusetts. Many persons cannot tell when watermelons are ripe. One sign is that at the little tendril where the stem of the fruit is attached to the vine, green fruits sound solid, ripe ones more hollow; the fruit will also "give" a little when firmly pressed,

if it is approaching ripeness.

Celery is a very important vegetable for fall and winter use. It will row well on level ground, and is thus planted by market growers; but in trenches, it makes its finest possible growth. Advantages of trench culture are that water is more easily applied, the plants are more readily hilled up, and the trenches give shade to the plants in hot weather. An abundance of well rotted manure should be placed in the trenches, as celery is a gross feeder. Golden Self Blanching is the finest early variety; Golden Rose is also good; White Plum is handsome, but of coarse texture. Good winter sorts are White Oueen, Giant Pascal, and Boston Market. The richest and most mellow soils should be used for celery culture. Early varieties may be bleached by means of boards, but the latter sorts must be hilled up by degrees, and housed in a cool, frostproof cellar before weather becomes too severe. It must also be aired on all favorable occasions. In lifting celery the earth should be moist; if not, apply some water after planting in the frame or cellar, and always take a nice ball of earth with each plant.

Onions are one of the most popular vegetables, and it is not difficult for the small grower to produce an all-the-year-round supply on a small piece of ground. The ground can hardly be made too rich; cow manure, with some soot added, is extra good as a fertilizer. The ground must be prepared, and the seed planted just as soon as possible after the frost has left the ground, and it has sufficiently dried out. For the earliest crop, plant small sets; we prefer the yellow ones, four inches apart in the rows. Very small sets are the best; those from one-third of an inch in diameter upwards will largely run to seed. We like to roll or tramp the onion ground before drawing the drills, which can be twelve inches apart, giving another tramp after covering the drills. Just as soon as the seed is sown, start cultivating, and keep at it constantly, until the tops are so much grown as to prevent it; also weed the rows carefully, especially a rain, when they will pull up most easily. It is no use planting this crop unless this matter of weeding is religiously attended to.

The so-called new onion culture is really a very old practice, and was in vogue in Great Britain half a centure or more ago. It consists of sowing seeds in flats or in a cold frame late in February, or early in March, and transplanting the seedlings in well-prepared ground about April 15. Very large bulbs are secured in this way, fine for exhibition, but they will not keep well; in fact, very few are sound after Christmas, and this mode of culture is not to be recommended where onions are wanted through the whole winter. For this method of culture, Ailsa Craig and Prize Taker are excellent. For sowing outdoors, Danvers Yellow is the onion par excellence; Prize Taker, Australian Brown, and Red Wethersfield are all good.

Asparagus is one of the most highly prized of vegetables, and comes in season very early. It does not take a very large bed to supply a small family, and if the ground is deeply trenched, well manured, and cared for, it is good for twenty years. Reading Giant, Columbian White, and Giant Argenteuil are splendid varieties. The plants should be in rows, three and a half feet apart, and eighteen inches between the plants. In planting, care must be taken to set the roots deeply, and cover only lightly at first, covering

in gradually as the plants grow.

Spinach of the round-leaved type is of course indispensable, and for summer use nothing beats the New Zealand variety. This must not be planted before May 10, however. With this latter vegetable, and a small row of Swiss chard, it is possible for a large family to secure a constant cut of greens for at least

four months in the year.

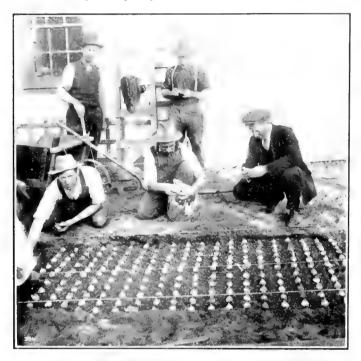

I have not mentioned salad plants; of these, lettuce is the most valuable, and by starting seed in the house or cold-frame, and making successional sowings outdoors from the end of March until the middle of August, heads may be cut from the early part of May until the end of November. For the earliest sowing, White Seeded Tennis Ball and Big Boston are leaders: for later sowings, May King, Deacon, Black Seeded Tennis Ball, and Sutton's Standwell are reliable. The Romaine or Cos Lettuce is popular with many; Trianon is a good self-bleaching sort. Endive is an excellent and handsome salad plant when well bleached; the plants want more severe thinning than lettuce, and to bleach them, the outer leaves should be gathered to a point and tied with raffia. Endive can be kept in the cellar, packed in dry sand, through a good part of the winter. Green Curled and Batavian are splendid sorts.

In miscellaneous vegetables, there are leeks, which should be sown only, and given rich culture, to secure big, handsome stalks; these keep in fine condition until May in a cold cellar. Musselburgh is a standard variety. A clump or two of chives takes up little space. For borderings, nothing is more beautiful than parsley; the plants should be thinned out six or eight inches apart. On well drained land, with a covering of leaves, this will survive our New England winters. Dobbie's selected and Champion Moss are beautiful curled types. White Velvet okra or gumbo is valuable for soups. It succeeds best in a hot summer, and the seed should not be sown before May 10 in this latitude. A few roots of indispensable rhubarb and one or two roots of horse radish should always be included. In the way of sweet or pot herbs, fennel, dill, sweet marjoram, sweet basil, sage, thyme, and summer savory are very useful.

#### HOLLAND'S FAMOUS HORTICULTURAL EX-PERT AT THE PANAMA-PACIFIC INTER-NATIONAL EXPOSITION.

A. Van Vliet, a famed horticulturist, who built the famed rose and tulip gardens of the Hague Peace Palace, in spite of the war cloud that hovers over his own country of gardens, has come to San Francisco to build, as a setting for the Netherlands Building, the most wonderful example of formal gardening that has ever been seen in America.

Mr. Van Vliet is enthusiastic about California. "It is better than Holland, the country of gardens, for the building of gardens. Here things grow without being asked," he quaintly says of local soil and climate.

AIRIE VAN VIIET, ON THE RIGHT, SUPERINTENDING THE PLANTING OF RARE BULBS IN THE NETHERLANDS GAR DENS AT THE PANAMAPACIFIC EXPOSITION

An out-of-doors man, enthusiastic about his art, which has carried him to remote places and taught him the garden lore of two lands, England and Holland, Van Vliet is a typical example of continental specialized learning. There is nothing about gardens, ancient and modern, or their planning, that the blond Hollander does not know.

To San Francisco, with its ideal climate, he is bringing the finest examples of his skill. "My country," says Van Vliet, "is the country of gardens. I was born in the province of Boskopp, and grew up among the rose gardens that cover that province. That is why I bécame a builder of gardens.

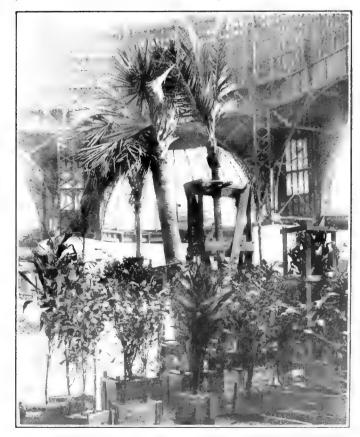

"There is not one bulb, one flowering shrub, one little blade of grass that is to grow up in our little section of the Panama-Pacific International Exposition, that did not come from my country—the Netherlands. Already I have brought out bulbs costing \$10,000. My flowering shrubs and trees are about to be shipped.'

The Cuban horticultural exhibit has also arrived at the Panama-Pacific Exposition, San Francisco, Cal. The exhibit includes mammoth palms, tree ferns, foliage plants, and many horticultural novelties. The place of honor, immediately beneath the great glass dome of Horticultural Hall, 1821/2 feet in height and 152½ feet in diameter, has been assigned this remark-

THREE FERNS FROM CUBA IN THE PALACE OF HORTICULTURE AT THE PANAMA-PACIFIC INTERNATIONAL EXPOSITION.

able exhibit which includes tropical fruit, shrubbery, palms and a varied collection of plants.

TRINCESS PALMS TO THE LOT THE HELDER AND COLLEGE AS THE SPECIMENS OF THE CLASS DESPENSATION OF THE FOLLOW. OF HORBSTILLER STAIR TAX MAP

# Work for the Month of February

By Henry Gibson

February is an excellent time to do any necessary overhauling among such foliage plants as palms, crotons, dracaenas, pandanus, marantas, etc. The majority of these require an annual repotting or top dressing. While a good growing medium is indispensable to success with these plants, yet it does not follow that the compost used must be of a very rich nature. In fact, we believe that a rich potting material detracts from the beauty of the crotons, pandanuses and other highly colored foliage plants, insomuch as it sets up a rapid growth and the plants take on a green color that is far from encouraging to those who admire a well colored foliage plant. June loam, leafmold and sand with the addition of a little soot and charcoal is a mixture that suits a good many of these plants.

In potting, small shift should be the rule. When oven potted the soil is apt to become waterlogged and sour before the roots have time to penetrate it and success under such conditions is impossible. Such plants as are not in need of repotting may, after having some of the old soil cleaned away, be top dressed with some of the potting material. For palms, and especially for large plants, the soil would be better with the addition of some old cow manure and coarse bone. Pot firmly and water with caution until the roots begin to permeate the new compost. As the work of repotting proceeds it would be well to look over each plant to see if it is free from scale, mealy bug. Don't put dirty plants back in the houses. A little insecticide will loosen up the scale and a Stott nozzle on the end of a good hose is the most effective method of cleaning off mealy bug that we know of.

The present month is a good time to increase one's stock of crotons, dracaenas, pandanus, etc. A close propagating case with a brisk bottom heat is necessary and the cuttings should be freely syringed on bright days. Sometimes it is found that pandanuses do not furnish much material for propagating purposes, and when this does occur it will be found a great encouragement to the development of side growth if a few of the center leaves of the old plants are pulled out, thus checking its growth. It may be necessary to give some shading to the more highly colored leaved plants in order to prevent scorching. In the event of this being necessary, make it light, for we are sure to have some dark weather yet.

#### Calanthes.

These beautiful terrestrial orchids are now nearing the end of their flowering season and as their success another season depends greatly on the treatment they receive during the next two or three months, it will be well not to overlook them. After the flowers are cut, the bulbs should be rested for seven or eight weeks in a dry place where the temperature does not go below fifty degrees. They should then be shaken out of their flowering pots and stood close together on a mixture of sand and leafmold in shallow boxes, where a temperature of from sixty-five to seventy degrees at night can be maintained. By keeping the material they are resting on moist and sprinkling lightly overhead occasionally, the bulbs will come into active growth. When the young roots are fairly active again potting should be done at once, or many of the young rootlets will be broken.

#### Campanulas.

Mention was made in our November notes of the usefulness of these subjects for conservatory decoration during spring. Now is the time to bring them from the frame where they have been wintered into a cool greenhouse. Campanulas need to be well rooted in their pots and no attempt should be made to force them. If put in a high temperature they will not come a bit faster and the first thing one knows they are damping off. They require a temperature of forty-eight degrees now and three or four weeks hence they will stand a little more, and when once they begin to shove their flower spikes above the foliage one can expect to see flowers inside of a month.

#### VIOLETS,

For those who propagate their own stock, the violets are now showing some fine material for the sand. Take none but the sturdiest and healthiest cuttings and put them in the propagating bench in the carnation house. Give them some shade, any necessary watering and moisture and they will soon root. When this is done they can be placed into shallow boxes using two parts loam, two parts leafmold, one part rotted manure and the same of sand. Plenty of ventilation is necessary to keep them sturdy. Care should be exercised when watering to avoid getting them in a wet sour condition. Give an overhead spraying on fine days and keep the night temperature as near fortyfive degrees as possible. The old plants should have plenty of air on all favorable days. No set rule can be laid down. During the mild spells it is always good practice to lower the fires lest the temperature runs up too high, which would not only detract from the quality of the blooms, but also lowers the vitality of the plants to a marked degree.

A sharp watch should be kept for both green and black fly, which soon make short work of violets if allowed to become established. So don't overlook

fumigating.

#### CHRYSANTHEMUMS.

With the advance of the new year the growers of 'mums for exhibition purposes usually turn their thoughts to propagating and no doubt ere these notes appear plenty of stock will be rooted. For slow growing varieties and where extra large bush plants are wanted this is alright, yet we are of the opinion that for general exhibition purposes the present month and on through March is the proper time for rooting cuttings. On the other hand, however, it would not be doing any particular variety justice to propagate it too late and condemn it as worthless when by earlier propagation it might have had a chance to show its

All stock plants should have a well lighted bench in a house where the temperature is around fifty at night. If the stock has been wintered in a frost-proof frame, remove the covering from them and give air on all favorable occasions, so as to avoid weak spindly growth. Sturdy short-jointed cuttings are what one wants to put in the sand.

With a propagating bench facing north the cuttings when once watered in will need but little other attention until they are rooted. As soon as they have made roots half an inch long, they should be potted. Many

(Continued on page 20.)

#### SOME 1915 CHRYSANTHEMUM NOVELTIES.

The accompanying illustrations are a few of the chrysanthemum novelties offered this year. Some are claimed quite distinct and superior in color and season to any of the existing seats.

to any of the existing sorts.

Mrs. William H. Walker, introduced by Scott Bros., is a seedling from "Francis Joliffe" and "Hon. Mrs. Lopes"; in size fully equal to either of its parents. Its color is a clear lemon yellow with long petals curling at the tips. It is expected to prove a fine variety for exhibition purposes.

Joan Stratton, a very large flower, reflex in form, is a beautiful shade of pearl pink with a white ground.

It is also regarded as an excellent exhibition flower. The florets are long and broad and of good substance.

Miss Lelia Mary Bennett is described as a very distinct and telling variety of a rich crimson color, with fine stems and grand foliage. It is a full flower and is claimed to be the largest of its color now offered.

Miss Emma Roope is regarded as a fine specimen either as an exhibition sort or to be used as a specimen or decorative variety. It is a mauve-pink with fine foliage and erect stems, with florets evenly reflexing and of good substance.

MRS WM, H WALKER.

Gorgeous—one of last year's varieties—a golden yellow Japanese, is still a favorite. Its foliage is short and leathery and it has proven an excellent grower for cutting purposes. The flowers are large and of fine form.

#### BEGONIA GLOIRE DE LORRAINE

The begonia Gloire de Lorraine is one of the best pot plants that can be grown for furnishing the greenhouse with bloom during the winter months. It will last for many weeks with careful watering. After it has finished flowering, by picking off the old blooms and putting the plants in a temperature of 65 degrees, they will throw up growth from the base, which, if taken off and made into cuttings, will root freely and make plants for the following season. They will make better plants than you will obtain by growing the old ones on for another season, writes F. E. Smythe in *The Canadian Florist*.

The soil required for cuttings is two-thirds sand to one of fine loam. Fill two inch pots with the mixture, putting five or six of the cuttings around the edge of the pot. Give them a good watering, making sure that the soil has

been made wet right through the pot.

Place the pots in a propagating frame. If it has bottom heat the cuttings will root sooner. The box can be placed in a house with a temperature of 65 degrees. For bottom heat stand the box on bricks over the pipes. The glass will collect moisture, which will make the cuttings damp off. To prevent this the glass must be turned morning and night, and also shaded during sunny days by placing newspapers over it.

After two or three weeks carefully knock the soil out of the pots to see if they are rooted. Test in this way until you find that they have rooted, when the glass may be propped up a little. After this treatment for a few days the glass may be removed, thus hardening the cuttings to the temperature of the house. When properly hardened they can be potted off separately into three inch pots. Care should be taken when knocking them out of the cutting pots not to damage the roots.

The soil now required consists of two parts leaf mould to one part loam and one part peat, mixed with plenty of sand. If the loam is of a heavy nature a little fine charcoal mixed will help to keep it open. Being in only three inch pots the soil will want to be on the fine side. It must not be made firm, as the lighter this plant is potted

this time the better it is.

The pots may now be placed in a house with a temperature of from 65 to 70 degrees. The house will require to be shaded, because if the sun shines on the plants the foliage will become very light instead of a nice dark green.

MISS EMMA ROOPE.

GORGEOUS.

MISS LILLY MARY HANDLEY.

When the plants are pot-bound repot into five and six inch pots, according to the size of the plants. Make this their final potting. Use soil mixed as before, but a little coarser, and also pot a little firmer. Staking and tying should be attended to so that the plant will be of good shape.

When the plants are well established in their flowering pots a little artificial manure will be a great help to them. Never use it too strong, as the roots of the Lorraine are very tender and this would burn them, causing great harm to the plants. Syringing will be needed on bright days

as a moist atmosphere is required.

All bloom must be kept picked off till the plants have made their growth or until about a month before the plants are needed. The plants may then be hardened off so as to be used in a cool greenhouse or for decorating purposes.

#### WORK FOR MONTH OF FEBRUARY.

(Continued from page 18.)

cuttings are spoiled by being left in the sand too long, making, as they do, a weak spindly growth which has a tendency to turn woody at an early stage. Moreover, the roots spread into the sand and become interlaced with others, with the result that many are broken when they are removed.

If one has no propagating house and one has to resort to a part of a bench in a house where a miscellaneous collection of plants are grown, care should be taken to shade from the sun and avoid drafts or the cuttings will wilt and lose their vitality.

#### LEMON VERBENAS.

Old plants of lemon verbenas that have been resting should be given a little more water and be placed into more heat. Give them a place where the temperature is near that of the rose house. Treated thus they will soon throw out numerous young growths which make fine material for making cuttings of. Placed in a moderately warm propagating bed they will soon root if kept moist and shaded. Potted into 2½-inch pots in a rich compost and moved into four-inch pots as need for it arises, they will make fine stock for bedding out.

#### PRACTICAL TREE SURGERY.

(Continued from page 13.)

block of cement is then smoothed with the flat trowel so that it will slant slightly downward from back to front, in order to facilitate drainage. Over the top of this cement block a double or single sheet of tarred roofing (or thinner) paper is placed after it has been cut so as to fit the cavity. On top of this, another block of cement is built as soon as the first block is sufficiently hard to stand the weight and tamping without forcing any of it out at the bottom of the cavity. If the interior of the cavity extends well above the level of the external opening, it may occasionally be necessary to bore or cut a downward slanting hole from the outside to the top of the interior cavity, through which a watery mixture of cement may be poured to fill the upper part of the cavity and the hole. The main opening of the cavity must be completely closed with the stiffer cement before this watery mixture is introduced. When a block of the cement has partially hardened, it will be necessary to carefully smooth the outer surface or cut it down with the flat trowel to the level of the cambium, taking great care that the latter is not injured in the operation. If the cement is allowed to become too hard to trim with the trowel, it can still, with more or less difficulty, be cut back to the cambium line with a cold chisel and hammer. It is a rule with most tree surgeons to trim back the outer surface of the cement to an eighth of an inch or more below the cambium and then use a layer of stronger cement (one part of cement to one or two of sand) to raise it to the level of the cambium, after the filling has partially hardened.

The thinner mixtures of cement will set more firmly. If any mixtures thinner than the one already mentioned are used to fill a cavity, some sort of cloth or wire dam will have to be used to hold the cement in place until it is hard. For this purpose strips of burlap wrapped tightly around the tree so as to cover the lower part of the opening may be sufficient if the mixture is not very thin; otherwise, a more closely woven fabric, such as canvas or carpet, may be used.

After the cement filling has become thoroughly dry, the outer face may be painted with coal tar or paint, especially around the edges where cracks are likely to appear. This should not be done for several weeks after

the cement has been put into the cavity.

Sheet tin, zinc, and iron have been quite extensively used to cover cavities. When properly applied, these coverings often serve to keep out disease and insects for a long time. Oftentimes they are improperly applied, or the cavity is not properly treated. Under such conditions these tin-covered cavities are a greater menace to the tree than open cavities. In preparing a cavity for a sheet-metal covering, all the decayed, diseased and insecteaten wood is removed in the manner indicated under cement fillings, with two exceptions: There is no need of undercutting the cavity and there should be a narrow half-inch ledge of wood around the edge of the cavity to which the margin of the sheet metal can be tacked. The excavated cavity must be thoroughly sterilized and waterproofed. The sheet metal should be trimmed so that its edges will exactly fit along the edges of the bark. The metal can then be placed on a block of wood and holes an inch or less apart punched or drilled along its margin, through which long, slender, flat-headed brads may be driven into the ledge of wood around the cavity. The edges of the cavity and the inner side of the metal should now be freshly tarred. The metal is then put in place and nailed with a light hammer, allowing the center of the metal to curve outward, so as to conform to the general shape of the trunk.

In a tree which is not considered of sufficient value to warrant cleaning and filling the decayed areas or covering them with tin, these may be excavated, sterilized, and waterproofed. In this condition they can often be safely left for years if the waterproof covering is renewed as

soon as cracks or blisters appear.

As a general rule, tree surgery can be safely undertaken at almost any time of the year when the sap is not running too actively and the weather is not cold enough to freeze the cement. In most trees the sap will interfere with the work only from the time the buds begin to expand in the spring until the leaves are full grown. Cement work will be ruined if it is frozen before it is hard. It is not likely to be injured by frost after it has been drying for a week.

#### CALIFORNIA'S FINE ROADS.

It is reported that Sacramento County, Cal., will soon vote on a bond issue of \$2,425,000, to construct 271 miles of road and 54 bridges. The entire mileage is to be hard surface and will comprise gravel, macadam, a combination of gravel and macadam, and concrete with asphaltic wearing surface. California is rapidly becoming famous for its splendid roads, and when the many excellent county systems, supplementing the \$18,000,000 State system, are completed, may well invite comparison with the most noted road systems of Europe.

#### HERE, THERE AND EVERYWHERE

#### DISTORTING THE FACTS.

No matter how hard the scientist tries to disseminate accurate information, he finds some irresponsible just ahead of him with a story of plants or animals so wonderful that a public, educated via the moving picture route, much prefers it to any soler statement of fact. It is easy for the reporter on the hunt for a "human interest" story to contort the facts until they have little semblance to the truth in his efforts to entertain the public. The advertiser of a set of natural history books that are at present being introduced to the public asks in one of his circulars, "Do you know that the dew plant kills and eats every fly that alights on its petals by ensnaring with a sticky substance?" We confess that this is new to us. We have seen the sun-dew but never one that caught flies with its petals. In another place this same individual informs us that his books will tell us why an ant's head may often be seen walking by itself without a body. Since the ant's legs are attached to its thorax and not to its head we hope we may never encounter this remarkable sight. We know of several people who would never seek for the explanation of such a phenomenon in a book. It would be the Keeley Cure for theirs. Much as we value knowledge, we incline to agree with Josh Billings that "It is a good deal better to know less, than to know so much that ain't so."-Exchange

#### STARTING SMALL AND DELICATE SEEDS.

By far the simplest and most successful way to start very small seeds I think is the following: Fill a porous pot of suitable size with garden soil made fine and free from lumps. By jarring the pot settle the soil moderately. Do not press the soil. Leave the surface granular. Onto this surface scatter the small seeds. Now, jarring the pot lightly a time or two will settle most of the seeds between the soil grains, though most of the seeds will remain in sight.

Now place the pot in a vessel containing an inch or two of water and place all in a sunny and warm situation. The surface soil will soon become moist and will remain so as long as sufficient water is kept at the base of the pot. If the seeds be good one can watch them strike root and develop into plants of suitable size for handling. They they can be pulled out of the loose earth and placed in suitable positions for further development. Exchange.

#### THE FUEL VALUE OF WOOD.

The fuel value of two pounds of wood is, roughly, equivalent to that of one pound of coal. This is given as the result of certain calculations now being made in the forest service laboratory, U. S. Department of Agriculture, which show also about how many cords of certain kinds of wood are required to obtain an amount of heat equal to that in a ton of coal.

Certain kinds of wood, such as hickory, oak, beech, birch, hard maple, ash, elm, locust, longleaf pine and cherry, have fairly high heat values, and only one cord of seasoned wood of these species is required to equal one ton of good coal.

It takes a cord and a half of shortleaf pine, hemlo k, red gum, Douglas fir, sycamore and soft maple to equal a ton of coal, and two cords of cedar, redwood, poplar, catalpa, Norway pine, cypress, basswood, spruce and white pine.

Equal weights of dry, non-resinous woods, however, are said to have practically the same heat value regardless of species, and as a consequence it can be stated as a general proposition that the heavier the wood the more heat to the cord. Weight for weight, however, there is very little difference between various species; the average heat for all that have been calculated is 4,600 calories, or heat units, per kilogram. A kilogram of resin will develop 9,400 heat units, or about twice the average for wood. As a consequence, resinous woods have a greater heat value per pound than non-resinous woods, and this increase I value varies, of course, with the resin content.

The available heat value of a cord of wood depends on many different factors. It has a relation not only to the amount of resin it contains but the amount of moisture present. Furthermore, cords vary as to the amount of solid wood they contain, even when they are of the standard dimension and occupy 128 cubic feet of space. A certain proportion of this space is made up of air spaces between the sticks, and this air space may be considerable in a cord made of twisted, crooked and knotty sticks. Out of the 128 cubic feet a fair average of solid wood is about 80 cubic feet.

#### SAYS PLANTS EXHIBIT SYMPTOMS OF DEATH.

That plants, like animals, respond to anaesthetics, drugs and other stimulants, and exhibit all the symptoms of death agonics, was demonstrated to a large audience of Washington scientists in a lecture at the Cosmos Club recently by Prof. J. Chunder Bose.

a native of Calcutta, India, one of the world's authorities in the field of electrical physiology.

Prof. Bose, who has had conferred upon him by the British Government the high distinctions of the decoration of the Companionships of the Star of India and of the Indian Empire, speaks English fluently, and for more than an hour entertained his audience with an account of his principal discoveries of plant life phenomena. These discoveries show that there is not a single physiological phenomenon in the animal which is not duplicated in the plant.

The Bengalese scientist conducted an experiment with an apparatus invented by him which enables the plant to show on the screen that it feels or responds to all kinds of mechanical and chemical injuries much as animals do, and that at the moment of death convulsive movements take place.

By pinching a cauliflower plant with this apparatus the sensation experienced by the plant was thrown on the screen in the form of a light wave.

#### LAST FALL'S EXPORTATION OF HOLLAND BULBS.

So much has been said during the fall of 1914 in regards to few if any bulbs having been exported from Holland to the warring nations, and buyers of bulbs having been given to understand that the great influx of bulbs from Holland into this country was solely due to some of large Holland exporters having had their fine bulbs packed for their regular English and German trade, and not being able to export them to Germany and England. being compelled to send them to America, making buyers believe that the bulbs that were being sold at such low prices represented the cream of the Holland stock, which in other years was shipped to England, Germany and Russia, it may be quite apropos to here give correct statistics as to the actual exports of bulbs during the month of September, 1914, from Holland, in comparison to the total actual exports in the corresponding month of 1913. The quantities represent kilograms (one kg. is about 2.21 lbs.).

	September.	September.
Export of flower bulbs to:	1913.	1914.
U. S. America and Canada	999,500	-1.599.100
Great Britiin and Ireland	3,538,400	2,829,300
Sweden .	178,800	-1.076.001
Denmark .	158,400	1.56,200
Notway	51,400	90.609
Germany and Austria	1,443,300	2,306,990
Belgium and France	439,100	48,900
Russia	105,700	None
Other countries .	55,100	33,100

The increase of the export to Sweden is, of course, due to Russia importing via that country; the heavier export to America walargely due to the bulbs being of extraordinary quality last year, and the bulbs were consequently very much heavier. It was also due to heavy export for auction sales, a certain element in the bulb section growing almost exclusively for auction business in London and Berlin, and, finding these markets practically closed, or at least rather risky, dumping their auction products on the American market. The exportation of actually sold bulbs to the warring countries during September, 1914, must therefore be considered to have been entirely normal.

#### THE POPLAR TREES' SOLILOQUY.

By Mabel Hemming.

"Two striplings," when you planted us beside the garden gate. And we are very proud to think we've grown so tall and straight, We tower above the houses, and the other trees around. It looks a long way to us from our top leaves to the ground.

Within the garden where we've grown associations past—Bind us with many links so strong all throughout life they'll last, For time must many changes bring and friends will come and go. But still beside the garden gate your poplar trees will grow.

We'd rather give a better shade, but contented we must be. To grow up tall and straight instead, just like a "poplar tree" And fill the niche that nature made just as for us she wills Mite of the "Mighty Atom" which destiny fulfills.

We love to watch the little boys who play around at ball. To us the happy times they have, are happiest of all. And when old time has run its course and they've to manhood group.

"The poplars father planted" will be treasures all their own.

Though storms may twist and turn our boughs, and bend us half way down.

We'll still rise up and hold our own, in spite of nature's frown. And here's the lesson we might teach, in everything "he straight." Just like the "poplar trees" that grow beside the garden gate.

From Vational Varietanda.

# Brookside Gardens, Great Barrington, Mass.

One of the most attractive estates among the many that nestle about the foothills of the Berkshire Mountains is "Brookside Gardens," the home of Mr. and Mrs. Wm. H. Walker, located at Great Barrington, Wass

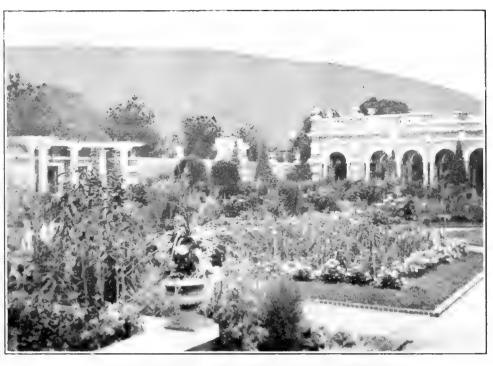

Thomas Page, the gardener in charge, scarcely

requires an introduction to the readers of The Chronicle. He is usually to be found among those of the craft who attend the various club and society meetings for the up-building of the gardening profession, and he is a staunch supporter of the national society. What he does is always done well. This was shown when he went to Indianapolis last fall and lifted the Chrysanthemum Society's silver cup with twelve blooms of that old chrysanthemum, "Mrs. J. C. Neil." There are unquestionably many better 'mums than Mrs. Neil grown today, and so his accomplishment demonstrates that there is something more than mere rule of thumb methods to gardening. Mr. Page is fully as capable in the management of this beautiful estate as in the cultivation of greenhouse stock.

Mr. and Mrs. Walker are both enthusiastic horticultu-

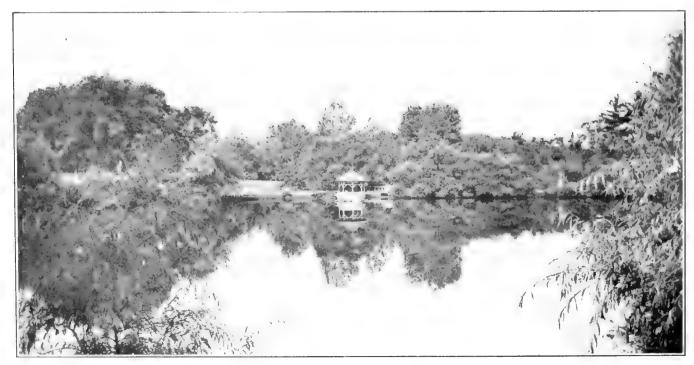

rists, and take a deep interest in the details of the planting and arrangement of "Brookside," which is a natural garden spot, with many lakes, streams and tumbling cascades. Considerable money has been spent in developing many of these natural features. Large quantities of native and improved varieties of trees, shrubs and perennials have been planted with telling effect; so that today "Brookside" stands out as one of the finest of Berkshire homes.

The "Wall" or "Sunken Garden," illustrated in these

THE SUNKEN GARDEN, AN ALERACTION OF THE ESTATE

columns is one of the chief attractions of the estate. It stands in a secluded corner of the place, and at one end is the beautiful loggia and the main entrance to the tea room, with its solid pillars of Italian marble. From

ONE OF THE NATURAL LAKES IN BROOKSIDE GARDENS.

the rear entrance of the tea room you enter another garden where sweet peas and annual flowers are principally grown. In this garden one of the greenhouse ranges is located, and an extensive natural lake borders it.

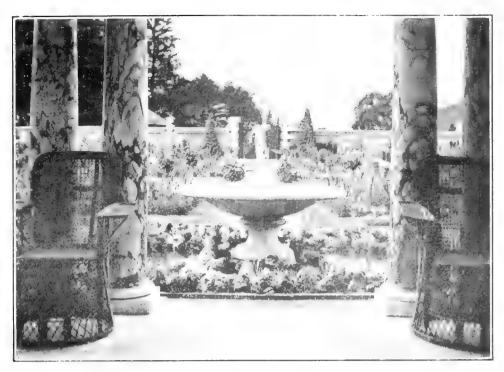

The wall surrounding the sunken garden is ten feet high. In one of the views Mr. Page is seen examining a delphinium, the height of which is easy to reckon. Note also the healthy appearance of astilbe, lupinus, alyssum, etc.

Another feature worth noting at "Brookside" is the color scheme of the perennial gardens, which is blocked off in harmonizing effect, each block containing just one color. The varieties and species are selected to give a continuation of bloom from early spring to late fall.

Much of the planting and rearrangement of this beautiful place has been done since Mr. Page went to "Brookside."

He has just completed a large vegetable and fruit garden, with a house for the growing of winter vegetables.

The greenhouses are commodious and well filled

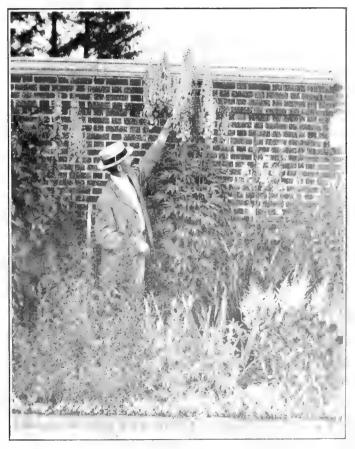

VIIIW OF THE GARDLA TROM INTRANCE TO BUT I A ROOM

with up to date stock; an extensive range of fruit houses is now under contemplation.

"Brookside" is an highly instructive spot and well worthy of a visit at all seasons. There is always something to attract you.

#### CHARLES McTAGGART.

Charles McTaggart, widely known in gardening circles. is no more. His untimely demise occurred on Sunday noon, January 10, as he was approaching the railroad station in his home town, Kearny, N. J., to board a train for New York. Walking on the westbound track, the warning of the approach of the eastbound train on the track on which he was walking, owing to repairs on the eastbound track, came too late. He was struck and when picked up life in the body was extinct.

Charles McTaggart numbered a host of friends among the gardeners, especially in the eastern states. The accompanying photograph depicts him in characteristic attire, and as he will be best remembered by his friends. Born in Gatehouse, Kirkendbrightshire, Scotland, forty-

five years ago, a grandson of the late James McTaggart, Provost of Gatehouse, he came to this country about twenty years ago. For the past seven years he has been connected with the seed firm of W. E. Marshall & Co., New York, representing the firm on the road most of that time. He is survived by his mother, Mrs. James McTaggart, and the death of her only remaining son leaves her without kin in the world. The firm, whom he has faithfully served the past years, in appreciation of those services, will undertake to lighten the sorrow and burden of the bereaved mother in her declining years.

The funeral services were held at his late home in Kearny, N. J., on Wednesday afternoon, January 13, and was attended by many friends both in and outside of the gardening profession. Among those who followed the remains to its last resting place in Arlington Cemetery, Arlington, N. J., were: John Brunger, D. Adams, James

THE LATE CHARLES MCTAGGART.

Aitchison, William Parclay, Robert Berry, James Bell, Edward Benson, William Bunny, J. Alexander, M. C. Ebel, A. F. Faulkner, John Garvan, John Hayes, A. Herz, Thomas Locke, Alexander McKenzie, Ewen McKenzie, Malcolm MacRorie, John McQueen, Joseph Marshall, George Meadows, George Mustoe, William Metzdorf, Lester E. Ortiz, Robert Petrie, Owen G. Ownen, P. W. Popp, James Stuart, Martin Tillotson, Alexander Thompson, George Thompson, George Wilson, Ant. Wild, Andrew Wilson, S. H. Whitefield, William Keyser, Andrew Kennedy.

The services were conducted by Rev. Robert T. Graham. The pall bearers were: A. E. Wheeler, Peter Duff, John Brown, Henry Rute, James Walker, Thomas Adams.

Charles McTaggart rests in peace. Long will he live in the memory of his friends.

## NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### THE PRESIDENT'S MESSAGE.

In greeting my fellow members, I want, first of all, to express my appreciation of the high honor that has been conferred on me by my election as president of the National Association of Gardeners. I shall try to merit this confidence by endeavoring to make my administration as successful as have been those of my predecessors in office.

On the growth and progress of our association, it is not necessary to dwell, as its splendid work of the past few years is a matter of record known to all who take an interest in the profession of gardening. Our responsibility towards the profession, which our organization represents, has not been lessened, however, by our progress, and it will require the untiring efforts of those entrusted to perform the various duties which an association such as ours imposes. Your officers and committees will succeed in their work if they have the active support of every member, to which they are entitled.

Our organization is a national one and its activities should not be limited to any one territory, but should spread from coast to coast. The co-operative movement. between the national association and the local horticultural societies, to bring them into closer relation, can be made the instrument for spreading the influence of the national association broadcast in this country and it should receive the serious consideration of every local horticultural society, or club, which includes the professional gardener in its membership roll.

Our summer meeting, which is to be held in San Francisco next summer, offers the opportunity to bring the association closer to the doors of our Western brothers, and those of us in the East who can do so, should avail ourselves of this opportunity to make the trip across the continent to meet our fellow gardeners of the West. I am looking forward to have that pleasure next August.

For the last three years the energies of the N. A. G. have been directed along constructive lines. Our foundation is now well established and we must turn to an instructive course. Our Co-operative Committee has not been idle, and this coming year should see great progress in a new direction for the benefit of the gardening profession.

There is still opportunity for increased membership. and I am not going to limit the 1915 Membership Committee. I will appoint every member of the association one of the committee and each one should obligate himself to enroll at least one new member within the year. You can do it and it will add much to the strength of our organization.

Let us all unite to make this year the most active within the history of the N. A. G.

JOHN W. EVERITT.

#### THE PRESIDENT'S APPOINTMENTS.

The following appointments are announced by President John W. Everitt of the National Association of Gardeners for the year 1915: To serve as directors for three years, until January 1, 1918: William H. Waite, Yonkers, N. Y.; William N. Craig, Brookline, Mass.; Edward Kirk, Bar Harbor, Me.; John W. Johnston, Glen Cove, N. Y.; Carl N. Folm, Colorado Springs, Colo.; Peter Johnsen, Dallas, Texas; Thomas Proctor, Lenox, Mass.

Committee on Essays and Horticultural Instruction: William H. Waite, Yonkers, N. Y.: Edwin Jenkins, Lenox, Mass.; Arthur

Smith, Reading, Pa.; William Craig, Brookline, Mass.; Theodore Wirth, Minneapolis, Minn.
Committee on Meritorious Exhibits: William Kleinheinz, Ogontz, Pa.; Alexander Mackenzie, Highland Falls, N. Y.; William Hertrick, San Gabriel, Cal.: Albin Martini, Lake Geneva, Wis.: James Bell, New York, N. Y.

National Co-operative Committee: John W. Everitt, Glen Cove, N. Y.; William S. Rennie, Ross, Cal.; James Stuart, Mamaroneck, N. Y.: Martin C. El el, Madison, N. J.

#### THE PRESIDENT'S PRIZE.

President Everitt announces that he offers one hundred dollars in gold in competition for the best written essays on horticultural subjects. There are to be two classes, the head gardener's class and the assistant gardener's class, the prizes to be competed for within the present year. The details of the competition are to be arranged by the Essay Committee and are to be announced at an early date. President Everitt makes this offer with an aim to arouse greater interest on the part of the professional gardeners in horticultural topics and to induce them to become more active in writing on horticultural subjects. The Essay Committee has taken up the work of formulating the plans for competition, and it hopes to complete the details in time to be announced in the February issue of the CHRONICLE.

#### COMPETING FOR THE ASSOCIATION'S MEDAL.

In come tion with the able committee appointed to pass on meritorious exhibits, President Everitt requests that the resolu-

tions passed by the Executive Board of the association in January, 1913, be again published at this time. The resolutions follow:
"It is regularly resolved that the association award a medal for any new variety of flower, plant, vegetable or fruit. originated by a gardener, a member of the National Association of Gardeners, and to be passed on as meritorious by a committee of judges, such a committee to be appointed annually by the President.

The attention of the gardeners is directed to this resolution and the secretary should be advised on any production qualified to compete for the association's medal.

#### NATIONAL CO-OPERATIVE COMMITTEE.

A correspondence course for classes in landscaping, forestry. greenhouse management and agriculture is planned by the Na tional Co-operative Committee which expects to make an announcement shortly of the completion of its arrangements. course is intended for members of the association to obtain scientific knowledge in connection with their practical experience and who have not the opportunity to avail themselves of a college

The committee requests that all local societies which have taken favorable action on the co-operative plan submitted to them between the national association and local societies, but which have not yet officially advised the secretary of the N. A. G. of their action, do so at once.

The committee also asks the local co-operative committees of the societies which have announced their intentions of participating in this co-operative movement, to communicate any suggestions they may have to submit from their local societies in relation to the co-operative plan.

#### NEW MEMBERS.

The following new members have been added to our roll during the past mouth: Prof. E. A. White, Ithaca, N. Y.; L. W. C. Tuthill, New York, N. Y.; C. Zandbergen, Valkenburg, near Leiden. Holland; Samuel Simmonds, Washington, D. C.; William J. Whan. Groton, Conn.; L. Bisset, Lenox, Mass.; Charles H. Lundgren. Ross. ('al.: Julius Erdmann, St. Louis, Mo.; George Wood. Rhinecliff, N. Y.; Thomas Hatton, Yonkers, N. Y.; Louis Ottmann. Mamaroneck, N. Y. Wm. Metzdorf, Oceanic, N. J.; J. H. Brunger, Irvington, N. Y.; James McDougal, Glen Cove, N. Y.; Sigurd F. Henderson, New Haven, Conn.; John McLane, Cedarhurst, N. Y.

SUMMER MEETING IN SAN FRANCISCO.

Several inquiries have come to hand regarding the summer meeting of the N. A. G. in San Francisco, Cal., in August next and what, if any, arrangements will be made for those going from the East. It has been suggested that an effort be made to get up a party to travel together. This suggestion will receive due consideration and will be reported on more fully in the next issue of this publication.

The Editor Gardeners' Chronicle:

Dear Sir Some of our members who attended the Philadelphia convention may have heard rumors of a movement having for its object the amalgamation of our association with another national society connected with horticulture. Personally, I did not come across one professional gardener in favor of it, the idea having apparently arisen in the minds of some outside our profession. While prepared to give those whom I heard in the course of conversation express their opinion that it would be a wise proceeding on our part, all credit for sincerity of motives, for being in every way favorably disposed towards our association and possessed of the kindliest feelings to ourselves, I know there are others not so disnosed.

In connection with our association we must remember that un to three or four years ago it was in a more or less moribund condition. Today, while we have only just got started, the state of things is

very different.

The position which our association now occupies—although it is nothing to what it will be-has only been achieved by the fact that we have been fortunate enough to secure a man, willing and able to devote a large amount of his time and money to advancing our interests and fighting our battles, to act as our secretary, who has done what no individual amongst ourselves could even have

Many of us are aware that there are men in the horticultural world who consider that our association has no right to exist and they have opposed it at every opportunity, not openly, honestly and above board, but in an insiduous and underhand manner. Upon several occasions our secretary has had to make strenuous efforts and put up a strong fight to obtain proper recognition for our association, which has resulted in victories all along the line and from which our association has come into a stronger position than before.

Having been defeated in the efforts used to crush our association,

a new method of strategy is being adopted.

In some quarters a movement is being engineered by those in opposition to our association to bring influence to bear upon our members to force us into amalgamation. Their reason for doing so is because they are fully aware that if amalgamation were to become an accomplished fact our association would at once entirely lose its identity; become an absolute nonentity in the horticultural world; practically cease to exist and all the work done during the past few years to place it upon a sound foundation would be entirely

Laying the foundation is invariably the most difficult part in building up an association, but as this can now be said to be accomplished, our future growth will not only be retarded by entangling ouselves with other associations, but it would be stopped

altoaether.

We must not swallow the specious and, upon the surface, plausible, arguments which some are advancing in favor of amalgama tion, but make up our minds once and for all to the fact that we have everything to lose and nothing whatever to gain by adopting it.

Co-operation is a totally different proposition, one that the

world cannot have too much of.

We must, however, not forget that amalgamation does not in any

way guarantee the bringing about of co-operation.

The co-operative movement between our association and local horticultural societies has already met with considerable success and it should have the loyal support of all of us because these local societies are to a great extent, in some cases entirely, composed of professional gardeners. By the working together of these local bodies and the national association a strong organization can be built up which will enable the fundamental principles upon which the N. A. G. stands to be still further strengthened and enable us to go forward with greater rapidity towards the goal of our ideals.

The nature of our work and the questions at issue connected with our positions upon private estates have little or nothing in common with the interests of commercial horticulturists. If there are any points of contact where at any time we can be of mutual help to one another it is only right we should co-operate to the fullest extent of our power.

Anything beyond co-operation would be virtual suicide, so far as

any help that outside organization can bring us in solving the many vital problems connected with professional gardening is concerned. Yours very truly,

ARTHUR SMITH, Reading, Pa.

#### AMONG THE GARDENERS

Thomas Hambleton recently resigned his position as superintendent of the C. A. Wimptheimer estate, at Long Branch, N. J.

It is reported that 825,000 are to be expended for a flower garden and several greenhouses by Ernest Howes, who bought the Col. Albert A. Pope estate, at Cobasset, Mass., and that it will be made one of the show places of that section.

Alexander Michie, of Plymouth, Mass., has taken out his life membership in the N. A. G. Mr. Michie is an enthusiastic believer in the possibilities of what may be attained by the N. A. G. in the interest of the gardener. He is a staunch supporter of it.

The friends of Lester Ortiz, superintendent of the Bliss estate. Bernardsville, N. J., will be glad to learn of the full recovery of his health. Mr. Ortiz is at the present time busily occupied in new development work on the Bliss estate, which contemplates a new range of glass in the not distant future.

John McLane has secured the position of superintendent on the Wickersham estate, Cedarhurst, N. Y. Mr. McLane comes to his new position from Olmstead Bros., Brookline, Mass., under whom he was engaged in landscape work.

George H. Hale, for many years superintendent of the E. D. Adams estate, Scabright, N. J., has resigned.

John Livingston, superintendent of the Chisholm estate, Porchester, N. Y., has just returned from Chicago, where he was for the past two months in charge of the quarantined cattle at the National Dairy Show. Although all the cattle were attacked by the hoof and mouth disease, for which the government claimed the only remedy was slaughter, through proper treatment, Mr. Livingston states, less than 1 per cent. of the cattle died.

#### LECTURES AT BOSTON.

The lecture committee of the Massachusetts Horticultural Society has issued the program of lectures and discussions on horticultural subjects to be given at Horticultural Hall, Boston, on Saturdays at 2 p.m., during January, February and March. These lectures are free.

The program is as follows:

January 16. "Selection and Care of House Plants," by Frederick E. Palmer, Brookline.

January 30, "Conference on Garden Planning and Planting," conducted by the staff of the Massachusetts Agricultural College. 10.60 a. m., "Trees and Shrubs for Home Grounds," by Prof. A. K. Harrison, 10:45 a. m., "Garden Planning," by P. H. Ellwood, Jr., 11:30 a. m., "Garden Furnishings," by Prof. F. A. Waugh, 1.30 p. m., "Practical Management of the Home Flower Garden," Prof. A. H. Nehrling. 2:30 p. m., "Herbaceous Annuals and Perennials." by A. S. Thurston.

February 6. "The Home Vegetable Garden," by H. F. Tompson,

February 13. "Conference on Fruit Growing," arranged by the Massachusetts Agricultural College. 10.00 a. m., "Grafting and Budding," by Prof. W. W. Chenoweth. 11.00 a. m., "Pruning." by Prof. F. C. Sears. 1.30 p. m., "Spraying," by Prof. R. W. Rees. 2.45 p. m., "Small Fruits," by Hon. Wilfrid Wheeler.

February 27. "The Culture of Hardy Shrubs," by Arthur E. Thatcher, Bar Harbor, Me.

March 6. "The Insect Outlook for New England." by Dr. H. T. Fernald, Amherst.

March 13. "Hardy Herbaceous Flowers," by W. A. Manda, South Orange, N. J.

March 27. "Diseases of the Peony," Illustrated, by Prof. H. H. Whetzell, Ithaca, N. Y.

#### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. S. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### ASSOCIATION NOTES.

The secretary had intended to have published and placed in the members' hands by this time copies of the constitution and by-laws revised to date, but on attempting to compile it he saw immediately that further revision will be necessary in order to have conformity and consistency, hence publication would be a useless expense.

The last published constitution and by-laws was in 1910, but in 1912 and 1914 amendments were enacted to Article 2 dealing with classification of membership. These amendments made changes in but two sections, and other sections which should have been changed to conform to the new sections were not disturbed.

In order to make an intelligent arrangement of the various classifications of membership, it will be necessary to revise the entire seven sections of Article 2, to conform to the spirit of Sec-

tions 1 and 2, which have been amended.

While the secretary has a pretty good idea of the intent of the changes, he did not feel like arbitrarily recasting the most important article in our constitution. Instead he will compile an entirely new article, carrying out the spirit of the amendments and submit same to the Executive Committee for submission to

Both the old and the new will be published in these columns side by side so that the need for revision may be apparent.

The proceedings of the Newburgh-New York convention will be printed and delivered to the membership about February 1, provided a couple of belated photographs of members of the Executive Committee arrive in time.

Following previous custom, the secretary is anxious to present portraits of the full set of officers, but has not so far succeeded

in getting a full set of photographs.

The series of articles on the park systems of various Pacific Coast cities begins this month with Seattle. Each month until the August convention one city will be covered, San Francisco, Los Angeles, San Diego, Portland, Tacoma, Spokane and Vancouver filling out the eight months and representing the eight Pacific Coast cities which have something to show in the way of park development, and all of which can be visited on the tour to the San Francisco convention with but slight additional railroad fare over a direct route fare. Read these articles and you will certainly plan to make the circuit of the Coast.

Members desiring up-to-date information on resurfacing of boulevards and drives and hard surface road construction should secure from Wm. H. Connell, Chief of Bureau of Highways, Department of Public Works, Philadelphia, Pa., the publication of that department, "Report on Service Test Road," which, besides containing a mass of detailed information such as specifications, cost records, etc., has thirty full-page half-tones illustrating every step in the construction and reconstruction of various types of hard surface paving. Philadelphia made exhaustive tests along this line last year, and the report on the subject is a text book worth having.

The little membership roster and year book recently sent to members seems to have made quite a hit, as the secretary has received numerous complimentary acknowledgments. The typographical work on the old leaflet form of roster cost practically the same as the new form, while a small booklet is more likely to be kept in a desk pigeon hole, or carried in the pocket for ready reference, hence the change of form.

To those who recall our convention at Harrisburg in the days of our earnest and efficient co-worker, F. L. Mulford the following message from Harrisburg received by the secretary will be

"The Harrisburg Park Commission, of which Grant V. Forrer was superintendent, is no longer in existence. The commission form of government has been adopted by Harrisburg, and the work of the park department is now under the supervision of the Department of Public Property and Parks with M. H. Taylor as superintendent. We do not feel, however, that it is of any advantage to the department to belong to your association, and are therefore returning your bill."

### PARK DEPARTMENT PERSONALS

Mr. Phelps Wyman, landscape architect of Minneapolis, was mentioned in our October notes among others who had dropped their membership with the association on account of leaving park work or otherwise. This was a little misleading, as Mr. Wyman is very actively identified with and interested in park work, and to prove it he has reinstated himself as an associate member of the association; in fact, his being dropped was entirely through a misunderstanding.

J. O. Convill has succeeded E. L. Mische as superintendent at Portland, Orc. Mr. Convill was for many years assistant super-intendent, and fits into the position nicely. He has notified the secretary of his desire to become a member of the association, and is anxious to have members enroute to the San Francisco convention stop off at Portland.

Earnest Kettig, superintendent at Louisville, Ky., whose membership had been permitted to lapse, has thought better of it, and reinstated himself to good standing. Mr. Kettig's name does not appear on the official roster issued prior to his reinstatement, hence members should make the notation in their roster books. Louisville has been making rapid progress in recent years along the line of playgrounds as set forth in a recently published report.

Ray F. Weirich, of Des Moines, Ia., has severed his connection with the park department of that city, and has engaged in private practice as a landscape architect. This seems to be getting to be a habit with many of our members, and would indicate that the field of landscape architecture is a promising one or else a haven for deposed park executives. Mr. Weirich incidentally is drop-ping his membership in the association, which is unfortunate both for him and for us.

Fred C. Green, the genial superintendent and secretary at Providence, R. I., is already planning for next year's convention, and has sent to the secretary for an itinerary and routing so that he will be able to see as much as possible of the entire Pacific Coast. Mr. Green has never missed a convention since becoming a member of the association, and gets much pleasure as well as profit from convention sessions and travel enroute.

J. H. Blackwood, secretary at Winnipeg, writes that the war is not having the depressing effect on Canadian cities that is commonly supposed, and but for the assembling and drilling of several thousand soldiers in the city all the time, there is no evidence of the war in Winnipeg. Mr. Blackwood is laying his plans already to attend the San Francisco convention next August, and George Champion, superintendent, will of course be on hand as he rarely misses a convention.

Wm. A. Gorman, for several years superintendent at Brooklyn, is disengaged as the result of numerous changes made in the various park departments of Greater New York during the past year. Gorman made are excellent regord in his administration of park affairs in Brooklyn, which includes the famous Prospect Park, and our membership certainly will hope that he secures another assignment and remain in park work.

Clarence L. Brock, superintendent at Houston, Tex., has forwarded the editor a copy of the "City Book of Houston," which is about the finest thing in the way of a municipal hand book which we have seen. It is a 400-page publication containing full reports of all municipal departments, commercial articles and statistics, scores of illustrations of scenic and commercial views; in fact, a combination booster book and municipal report which might well be patterned after by other cities. If you want a copy, a request to Mr. Brock will probably get you one, but if you get one, you might as well plan your return trip from San Francisco v.a the Southern route because you will sure want to see Texas.

Frank Brubeck and Wood Posey, formerly superintendent and secretary at Terre Haute, Ind., but deposed last year through a radical change of administration, are probably deriving consid-(Continued on page 1)

# Seattle's Recreation System\*

By J. W. Thompson, Washington.

It is usually a source of great surprise to visitors to the Pacific Coast to find the cities so well provided with modern recreation facilities, and while it is quite generally known that Seattle has become the commercial metropolis of the Pacific Northwest, it is not as well known that it is further advanced in the matter of the acquisition and development of recreation grounds and facilities than any city west of Chicago, and this includes a number of cities much larger in population than Seattle.

Contrary to the usual experience of Western cities which have sprung up and grown rapidly, the city beautiful idea has not been lost sight of and from the very beginning of the real growth of the city plans

were made to provide recreation spots.

MT. BAKER PARK LAKE AND WASHINGTON BOULEVARD.

Nature has blessed Seattle with a magnificent setting for a beautiful city, nestling between two snowcapped mountain ranges, with lakes and hills in and

about the city.

With the placid waters of Puget Sound, an arm of the Pacific Ocean, forming the western boundary of the city, Lake Washington, thirty miles in length, forming the eastern boundary, the city rising on its seven hills between the Sound and the lake, with two large lakes (Lake Union and Green Lake) within and surrounded by the city, with the snow-capped Olympics across the Sound to the west, the lofty Cascades across the lake on the eastern horizon, Mt. Rainier, the highest mountain in the United States in full view to the south and a distant view of Mt. Baker, near the international boundary to the north, what more could one conceive in the way of scenic environment. In addition to this wonderful topography was the added blessing of beautiful forests covering the hills and native vegetation in great variety, so that the beauties of nature were in evidence on all sides.

The citizens of Seattle were quick to realize that, with nature's endowment, the city had before it an opportunity to provide a park and parkway system which would attract the eyes of the nation and in 1904, when the charter of the city was being revised in order to lay the foundation for a large city, provision was made whereby the jurisdiction and control of all recreation properties and facilities were placed in the

The first of a series of articles which will appear monthly between now and the San Francisco convention, describing park development in the cities of the Pacific Coast.

hands of an honorary park commission, absolutely independent of the legislative branch of the city government and with certain fixed revenues.

The first step was the adoption of a comprehensive plan, providing for a series of parks and playgrounds in all sections of the city with a chain of boulevards connecting many of them, the idea being to preserve as many beauty spots and scenic points as possible.

The citizens of the city approved the plan and have consistently and regularly provided the funds for carrying them out, four million dollars in special funds having been voted by the people for land acquisition and improvement as well as about two million dollars in regular revenues since 1904, so that the Seattle Park System as it stands today represents an investment of six million dollars.

Eighteen hundred acres of property have been acquired for park purposes, most of it wooded area embracing natural features which were sought to be preserved.

There are thirty-three parks ranging in size from a city block to two hundred acres in area. The system of providing a park in every district in the city has been followed, resulting in many small neighborhood parks in preference to one or more large parks and few small ones, as is the custom in many cities. The Seattle plan is to provide a park or a playground within a half mile of every home in the city, and this will be the condition when the plan is carried out. Twenty-five of these parks are improved and open for public use at this time and improvement work is being carried forward systematically. Of the parks in use about two-thirds are of a standard type of community park, containing lawn areas, flowers, trees, shrubbery, walk and resting spots. Volunteer Park, the close-in park, is the most formal and metropolitan park of the

TRINK POULEVARD IN COLMAN PARK.

system, although but forty-eight acres in area. Broad lawn areas interspersed with native trees, walks, drives, music pavilion, pergolas, conservatory, observation tower, children's playgrounds, statuary, formal gardens, etc., go to make up a rare combination of landscape treatment and recreation features, while the scenic outlook from the park excels that of any other point in the city, it being the highest in elevation and commanding a sweeping panoramic view of hills, lakes, ocean and mountains.

Woodland Park is the largest park in the city, one hundred and seventy-nine acres in area, and as it contains a greater variety of features which appeal to the masses, its patronage is the largest. The entire area originally was wooded with hundreds of tall fir and cedar trees, and these have been preserved except in sections necessary for open landscape treatment. The park has a half mile of frontage on Green Lake, affording boating and bathing facilities, extensive athletic field areas for all forms of sports, picnic and concert groves, broad lawn areas, miles of walks and drives and a very creditable zoological exhibit, housed in modern buildings.

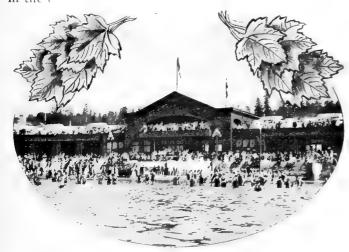

BUFFALOES IN WOODLAND PARK.

Ravenna Park is one of the most unique natural parks to be found within the limits of a city, containing sulphur and iron springs, famous for their medicinal properties; also a group of large fir trees, several more than ten feet in diameter.

Schmitz Park, a beautiful tract of virgin forest on the West Seattle peninsula, is a nature lovers' paradise and is regarded as the most valuable park property of the system, as its natural features place it in a class by itself.

Leschi, Madrona and Mount Baker Parks on the shore of Lake Washington are typical lakeside parks, always popular with people bent on outdoor recreation.

Kinnear Park is distinctive by reason of its being a commanding viewpoint, on Queen Anne Hill, overlooking the harbor, also because of its beautiful landscape work and vegetation, it being the second oldest park in the circ

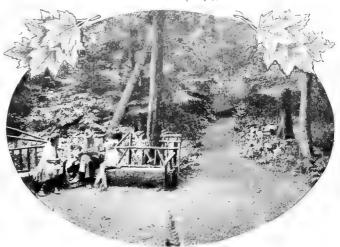

ALKI BEACH PAVILION.

Alki Beach, the only municipal bathing beach on the Pacific Coast, is the great recreation spot of the city during the mid-summer season. Located at West Seattle at the exact spot where the pioneers of Seattle first landed and settled, a half mile of salt water frontage at the entrance to the harbor has been acquired and improved as a marine view park and bathing beach.

A substantial bath house has been constructed, having a capacity of 5,000 persons per day and during the three months' bathing season of 1914 approximately 65,000 bathers were registered.

In the matter of children's playgrounds, Seattle has

IN THE WILDS OF SCHMITZ PARK.

made wonderful progress, statistics proving that there are only three cities in the United States, regardless of size, that have superior playground facilities to those of Seattle.

In addition to playground sections and equipment in many of the parks, twenty-four distinct playground sites have been acquired ranging in size from a city block to fifteen acres, the whole aggregating one hundred and forty-four acres. Twenty of these playgrounds are in use at this time, twelve of them being well improved with outdoor gymnasium apparatus and equipment, wading pools, tennis courts, ball fields, shelter buildings, etc., with trained instructors supervising during the summer season, the remainder being serviceable as open fields, with ball grounds, tennis courts and simple apparatus, such as teeters and swings.

For winter work, four substantial field houses or

ORGANIZED PLAY IN PARKS

recreation centers are in operation, each having club rooms, social halls, reading rooms, assembly hall for lectures, entertainment and dancing parties, also public gymnasiums, with instructors conducting classes for people of all ages, practically providing athletic club service to the public free of cost.

The crowning features of Seattle's recreation facilities from a tourist's viewpoint is the Lake Washington boulevard system with its chain of scenic driveways, leading from park to park, through wooded dells, along the shores of lakes, on the high ridges overlooking the lakes, or by a serpentine course up and down the hills, with a fascinating panorama of forest, hills, lakes and mountains almost constantly in view.

Thirty miles of these scenic driveways are now in use and the chain eventually will aggregate fifty miles, practically belting the city and connecting the park

system.

In addition to the features now in use, Seattle is carrying forward a number of notable improvements which will add greatly to its recreation facilities.

At Jefferson Park on Beacon Hill, overlooking the harbor and city, an eighteen-hole golf links has been laid out and improved ready for service in 1915. Being only fifteen minutes from the heart of the city and vet amid scenic surroundings, this course will, no doubt. attain a national reputation within a few years.

At Green Lake, the entire water frontage of the lake has been acquired and by a diking and dredging process over one hundred acres of land is being reclaimed and a parkway is being constructed completely around the lake, with a series of small parks and children's playgrounds. This will give nearly four miles of lake frontage, with a large natural lake, entirely within a park, the whole surrounded by a well settled residence district.

The boulevard system is being extended by the construction of a four-mile scenic driveway around the crest of Queen Anne Hill, a close-in, high-class residential district, while a parkway to the northwestern part of the city to Fort Lawton, via Magnolia Bluff, a high promontory at the entrance to the harbor, is under way and is destined to be a great scenic feature on

account of its marine and mountain view.

Altogether Seattle can well feel proud of recreation facilities that are worthy of a city double its population. The balmy summer climate of Puget Sound, the mild winters and the array of recreation features afforded are all conducive of outdoor life and physical development, hence it is little wonder that the government statistics show that Seattle is the healthiest city in the United States, and it is the verdict of those who have visited or located in Seattle that it is the most beautiful city.

# Permanent Policy in Park Management Desirable

By E. T. Mische, Oregon.

A progressive park extension program is inseparably associated with public welfare, and its working out is but a part of a movement dealing with a complex urban organism.

Deficiencies and failures due to the lack of a general plan on the one hand and of a body controlling a harmonious and continuing plan on the other are evident in park affairs. Twice has the public had an opportunity to pass upon an extension policy in park matters, and each time have the measures been defeated. We are unwilling to believe that such a short-sighted and expensive action would be deliberately and consciously recorded were the facts necessary for an intelligent

judgment made known.

In recent years there has been a special investigation made of our harbor, another of park needs, and yet a third of the city at large and including transit affairs, parks and harbors. At a cost of over \$20,000, publicly subscribed, plans were prepared by a Chicago expert, and still there is no official adoption of them as a working basis and no public assurance that the advantage to be gained from these expert investigations is to be utilized. Moreover, there is no controlling body actively engaged in promoting the interests of the city by devising schemes, criticising others, and shaping public affairs in a manner to assure the public that current constructions of more essential sorts are being made to fit the needs of the city at large, in a broad-gauged, thorough-going fashion.

If past effort in proposing a city plan is an esthetic vagary, utopian, having impractical dreams unacceptable to prudent and progressive business men, it is possible that the scheme requires revision or should actually be rejected, yet it does not argue that the

underlying motive that brings such a plan into being is not meritorious.

County officials are engaged in developing a system of roads that with slight additional provisions would serve as parkways; the School Board is often buying land for school sites; occasionally, some of this land is sold. With some modification these selfsame parcels could advantageously and often very econom-

ically be incorporated in the park system.

European cities devise official plans of suburban tracts and private owners are by law compelled to conform to them. Some American cities, like Baltimore, scheme urban street extensions in advance of actual needs. True, the adoption of this anticipating method is not an insurance against all future ills; the merit of good designing will help vastly, but unforeseen changes will occur that human prophecy and limitations can not fathom, but these deficiencies are not sufficient excuse to abandon all effort toward doing any planning for the future. If we are to profit by forethought; if we are to gain by following a meritorious plan evolved after due study by competent collaborators, we should see to it that a general working basis is approved, its essentials understood by the public at large and insisted upon in public affairs.

In all of this work there should be a unifying and co-ordinating of results even though the separate results are under different control, else there will be needless waste or conflict of purpose along with the unfortunate results that follow such procedure. Were this view of the general problem agreed upon, it would assume the collection of data of the city, both physical and social, would be made a permanent work, be defined and made progressive and systematic in method and sort; that the data would be conveniently available to the general public and evidence given that it is officially used by competent designers of

<sup>\*</sup>Extract from 1's report as Superintendent of Parks, Portiand, One

public work and all public work harmonized into a general unit. Upon this foundation an official plan could be promulgated and criticised and revised and otherwise controlled by a body of citizens qualified to pass upon it. Thereafter, this same body should be empowered to make reports and recommendations upon specific parts of the plan, such reports to become public records. This body would thus be unofficial sponsors for the securing of the sympathetic working out in all its related parts of an adopted plan. It would not only approve current projects, but if proposed plans were not acceptable, an explanation would be made as to the reasons and suggesting how departures from essential features shall be rectified, or even how the adopted plan may properly be altered to harmonize with later developments.

Current projects which are live issues seem to warrant that some better, more secure, continuing, and approved form of control be put into existence, to the end that public confidence and approval shall develop to such an extent as to require new public officers to follow well understood and approved policies that were advisedly settled upon.

#### A PITA FOR PARKWAYS

During the last decade considerable public discussion was elicited about various phases of a park system and park work. The deduction that the public was ever being better informed and educated upon park affairs could be reasonably assumed. Let it be understood that one of the most fertile means of public extravagance in park expenditure comes about by reason of vacillating policies, upsetting, alternating or subverting policies that should be fixed. Perhaps nothing in municipal life is planned so far in advance as parks. They require for their best and greatest return steadfast adherence to the original plan. Some of the older cities provide glaring examples of unfortunate, short-sighted and wrong conceptions of park affairs. Nor is it always due to political influences nor a lack of good intention. Weakness, instability, inaction or lack of comprehension is quite as dangerous as willful perversion, wanton misuse, or bad administration.

Recently a sentiment has arisen and found champions to the effect that parkways are only useful to those owning automobiles and should therefore be paid for exclusively by such persons, or by the property directly benefited. Another objection is raised against the policy of acquiring a greater width than the minimum required for the construction of a drive. These and similar ideas are not always those promulgated by politicians or class panderers and it would appear that a brief discussion of the subject is desirable.

Parkways are long and narrow parks, ordinarily including a driveway, and distinct from mere boulevards, which are tree-lined streets. The narrowness is primarily due to financial limitations.

What constitutes the essence of park composition is subject to great variation in different people's minds and parkways share this vague and confused conception. We find, therefore, that to many minds, parks are merely land, any size, any location, any or no development and with or without gardening, play features, drives and walks. On the contrary, let it be affirmed that park systems are justifiable to a community by serving in their natural aspect or by arrangements of natural vegetation and earth surfaces, as a safety valve to offset the artificialities of urban life, or in other words, as a health measure in conserving and restoring health.

A parkway system should give pleasant and convenient access to the landscape offerings of the region. The drives in it should possess graceful alignment, easy grades, and display such fitness to its use as to satisfy the intelligent thought of the users. Undue narrowness weakens the effect and leaves no parkway advantages. Parkways of that type exist in name only and the absurdity of any action based on a counter hypothesis is evident by stating that if a tree-lined street is the type of parkway to be used as a standard, it is quite unnecessary to expend money on any of them, since a new nomenclature for streets will be all sufficient. To assume that tree-lined ways are parkways is to accept a misnomer for a fact.

#### PARK DEPARTMENT PERSONALS.

(Continued from page 27.)

erable satisfaction from the fact that, according to news items of recent date, usually all of the idministrative officials of Terre Haute, from the Mayor down have been indicted by the Federal Grand Jury, and have been languishing in jail. He who laughs last, languishes best.

C. M. Loring, of Minneapolis and Riverside, Cal., celebrated his S1st butl day (centiv. and a lumbron in his Lonor was served at the Mission Inn. according to a press report. Mr. Loring spends his winters in California and devotes most of his time and considerable of his means to the beautification of Huntington Park in Riverside, of which he is honorary superintendent. Minneapolis is Mt. Loring's home however, and his name will always be identified with the park system of that city on account of his years of service on the Park Board and the beautiful park which heats his name. In spite of his advanced years, Mr. Loring is in splendid health, and is probably our oldest member actually in service.

#### PARK INSTITUTE OF NEW ENGLAND.

At the second meeting of the Park Institute of New England held in Worcester, Mass., December 16, twelve cities were represented with twenty-five present.

Mr. G. A. Parker, of Hartford, gave a talk on "Park Accounts and Reporting" after which there were questions and discussions on that subject.

Mr. Thomas E. Holland, Supervisor of Playgrounds, Worcester, Mass., read a paper on "Worcester Recreations," Owing to injuries received in an automobile accident Mr. Shea, of Boston, was unable to present his paper on "Park Administration and Legislation."

Mr. 8. Wales Dixon, Supervisor of Recreations in Hartford, gave a very interesting illustrated talk on "Recreations in Hartford," after which there were questions and discussions.

Mr. Chas. E. Ladd, Superintendent of Parks, Springfield, Mass., gave a report on "Municipal Dancing in the School Building," He said, although they had just started dancing in the school building, he was confident of its success.

Several members inspected the "Toboggan Slides" in Green Hill Park.

MODEL OF PROPOSED DESIGN FOR GEORGE II HERMANN PAPE.

SCALE LINCH. 160 FFFT. EXHIBITED AT TEXAS SECTION FLOWER SHOW, HOUSTON, IFNAS, BY C. I. B. COS.

#### PRIVATE GARDENERS.

#### Section A.

Class 1. Peter Henderson & Co.'s Prize. For the best 12 vases, 20 sprays to a vase, of 12 distinct varieties of Spencer Sweet Peas: first prize, \$25.60; second prize, \$15.00; third prize, \$10.00.

Class 2. The Arthur T. Boddington Prizes. Challenge Silver tup, value \$50,00. For a collection of Sweet Peas, 25 varieties, not less than 25 stems to a vase, to be shown with Sweet Pea foliage only. To be won twice by the same exhibitor. There will also be awarded to the winner of this cup (each time won) a cash prize of \$25,00; second prize, \$15,00; third prize, \$10,00.

Class 3. The Weeber & Don Prize. For the best vase of 100 sprays mixed Sweet Peas, arranged for effect. Gypsophila and foliage other than Sweet Pea can be used: first prize, \$5.00.

Class 4. The Mount Desert Nurseries Prizes. For the best vase of Sweet Peas, one variety, any color, 25 stems arranged for effect, any other foliage than Sweet Pea may be used: first prize. \$7.50; second prize, \$2.50.

Class 5. Joseph Breck & Sons' Prizes. For the best 3 vases, 25 stems to a vase, Spencer varieties: first prize, \$7.50; second prize, \$2.50.

(lass 6. The Henry A. Dreer Prizes. For best vase of Spencer Sweet Pea, Royal Purple: first prize, \$5.00; second prize, \$2.50.

Class 7. For best vase of Spencer Sweet Pea, Margaret Madison Improved: first prize, \$5.00; second prize, \$2.50.

Class 8. Hitchings & Company's Prize. A Silver Cup. For the best 8 vases of Sweet Peas, 25 stems to a vase, 8 distinct Spencer varieties named.

Class 9. The Sutton & Sons' Prize. A Silver Cup. value \$25.00. For the best table of Sweet Peas, covering 12 square feet, and not to exceed 3 feet in height. Gypsophila and foliage other than Sweet Pea may be used.

(lass 1c. The Burnett Brothers' Prize. For the best vase of White Sweet Peas (Spencer variety), 50 sprays to the vase. Gypsophila or foliage other than Sweet Pea can be used: first prize, \$10.00.

Class 11. The Thorburn Prize. A Silver Cup for best 12 vases of Sweet Peas, 12 Spencer varieties, 25 blooms to a vase.

#### Section B.

Class 1. W. Atlee Burpee & Co.'s Prizes. For the finest 12 vases Sweet Peas in 12 distinct varieties, correctly named: first prize, Silver Cup, value \$25.00, and \$10.00 cash; second prize, \$10.00; third prize, \$5.00.

Class 2. The Stumpp & Walter Co.'s Prizes. For the best 6 vases of Sweet Peas, 6 distinct Spencer varieties, 20 sprays to a vase: first prize, \$15.00; second prize, \$10.00; third prize, \$5.00.

Class 3. The Henry F. Michell Co.'s Prizes. The "Michell Seed House" Silver Medal for 6 vases, 25 sprays each, 6 distinct Spencer varieties Sweet Peas.

Class 4. The "Michell Seed House" Bronze Medal. For best 25 blooms "Illuminator" Sweet Peas,

Class 5. The "Michell Seed House" Silver Medal. For best vase Spencer varieties Mixed, not less than 100 blooms. Sweet Peas.

Class 6. The "Michell Seed House" Bronze Medal. For the best vase "Mixed Sweet Peas," not less than 100 blooms.

Class 7. The "Michell Seed House" Bronze Medal. For the best 2 vases of 12 sprays each White, and 12 sprays Pink Sweet Peas.

Class 8. The Thomas J. Grey Co.'s Prize. A Cut Glass Bowl. For the lest centerpiece of Sweet Peas for table decoration. Foliage other than Sweet Pea can be used.

Class 9. Watkins & Simpson Prize. For the best six vases of Sweet Feas Spencer, six varieties, 25 flowers to a vase. First prize, \$10.0%

#### Section F.

Class 2. The Jerome B. Rice Seed Co.'s Prizes. For the best vase of 1915 Novelty Sweet Peas. 25 sprays 1 variety: first prize, \$5.00; second prize. \$3.00; third prize, \$2.00.

Class 4. The American Sweet Pea Society's Silver Medal will be awarded for the best collection of Sweet Pea Novelties which did not appear before 1914.

Class 5. The American Sweet Pea Society's Silver Medal will be awarded for the best collection of Sweet Pea Novelties appearing in 1915 catalogues only. The American Sweet Pea Society's Bronze Medal will be awarded for the second best collection.

For the largest and most meritorious exhibit of Sweet Peas, The A. S. P. S.'s Gold Medal will be awarded.

the most first prizes in this section, viz.: G 1 to G 21. If there should be a tie, the award will include the most second prizes.

The Garden Magazine Achievement Medal will be awarded to the

The Garden Magazine Achievement Medal will be awarded to the finest vase of Sweet Peas in Section G. Classes 1 to 21.

The F. R. Pierson Cup will be awarded to the exhibitor taking

#### Section G.

Class 31. The R. & J. Farquhar & Co.'s Prizes. (Private Gardeners only.) For the best Spencer Sweet Peas, 6 distinct varieties, 1 vase of 20 sprays of each variety, open to private growers only: first prize, \$12.00; second prize, \$8.00.

#### NEWPORT GARDEN CLUB.

# For Private Gardeners and Amateurs. Section G.

Class 34. De oration for table of eight covers, glasses, cutlery and linen to be used and supplied by the exhibitor (except table): first\_prize, a Silver (up and \$25.00; second prize, \$15.00; third prize, \$10.00. Exhibitors will be allowed to use Sweet Pea foliage, Asparagus, Smilax, Gypsophila, or all; ribbons also allowed.

Class 35. For the best display of Sweet Peas for effect, covering a round table, four feet across, to be supplied by the society. Sweet Pea or other foliage can be used: first prize, \$15.00; second prize, \$10.00.

The Final Schedule will be published about June 1 with entry blank. Address all communications to Harry A. Bunyard, Secretary, 342 West 14th street, New York City.

#### QUERIES and ANSWERS

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.

Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

Can any reader of the "Chronicle" give us any information as to what causes the distorted and curled appearance of the young growths on antirrhinums? We have a number of plants, the growths and leaves of which are curled up very much after the same manner that peach leaf curl affects the leaves of peach trees. We have tried pinching out the affected parts, but the resultant breakers are affected the same way. We hardly think that this is caused by rust, a description of which appeared in the last issue of the "Chronicle." I. C., Long Island.

Can you give me any information through your "Queries and Answers" column about the cultivation of Gesnerias? Should they be started up in the spring or fall?-H. H. A., Ohio.

From the professional gardener's point of view, which are easiest to manage and give best results, own root, or grafted roses?—A. K. W., Massachusetts.

#### SNAPDRAGON RUST.

That the disease which attacked my antirrhinums belong to a different species of fungus to that referred to by Mr. Rees does not appear from a practical point of view to be of very great importance, although at the same time I was more than pleased to have it correctly named. In a further communication Mr. Rees asks me to make the correction at once, "otherwise much loss of time and money would caused." I must confess myself as being totally unable to understand Mr. Rees' point of view in making the latter remark.

The following facts will, I think, be admitted:

The disease both belong to the family of parasitic plants known as fungi.

They propagate themselves and spread from one plant to another by means of very minute spores which are produced by

the million from one pistule.

The attack in both these cases generally starts at the lower leaves, spreads upwards from one to another, soon the stems are attacked and the plants are ultimately killed.

Mr. Rees stated to me that any one might mistake one species for the other. I presume that he means any one who is not an

expert mycologist.

It is possible that in using the words combatting or controlling the disease I may have been misunderstood. Early last year in these columns I ventured the somewhat dogmatic statement that no fungous disease attacking plants can be secured so far as the particular part of the host plant affected by the disease is concerned. And I have yet to learn any reasons for altering this opinion.

Methods of combatting and controlling a fungous disease, whether it is called a rust, leaf-spot or anything else, are therefore only two, one only of which is suggested by Mr. Rees, that This is of course of removal and destruction of diseased plants. valuable in reducing sources of infection, provided every plant or portion of a plant attacked is removed before spores are produced, but this is a practical impossibility. Even if it were possible, what about the content of the provided content possible, what about the spores which started the infection? What guarantee is there that some of these original spores are not still floating about or upon healthy plants but yet ungerminated? One would suppose that any one, especially a scientific pathologist, acquainted with the life history of fungi, would be the first to advise the use of a fungicide in addition to the destruction of diseased plants because the latter is by itself, as all practical men know, useless. Ordinary common sense tells us that in controlling a fungous disease it is the spores that have to be prevented germinating, and with this end in view the

most advanced practice puts into action methods of control before the disease appears, whereby healthy plants are kept in that condition by the use of a tungicide, whether we are considering possibilities of potato blight, for instance, or any other.

In the case of a new fungous disease appearing upon plants not hitherto troubled in this way, the most natural step to take at once is to spray, and instead of looking upon this as a loss of time and money eve y one with the merest elementary knowledge of plant growing considers that not to spray is the easiest method of having time and money already spent in raising plants go for nothing.

It would be unwise for any one to limit the possibilities of science, and to say that it will never discover a method of successfully controlling fungous diseases without the necessity for spraying with a fungicide, but at the same time it is extremely improbable that this will ever happen.

We must always be careful not to confuse science with theory. Science is only another word for true knowledge, and therefore anything untrue is never scientific. Whereas theory is merely opinion, and may be right or wrong, according to circumstances.

It is as unsafe for science to put forth dogmatic theories as it is for any one else. The supposed principles upon which it relies for its theories are often no more than first approximations to the truth, and the want of parallelism, which may be neglected in the laboratory, give rise to wide divergencies when applied to practice. The method of science is, after all, only an extension of experience. In many matters connected with plant life, especially, for instance, the causes of soil fertility, science has yet only reached the position of being able to explain the why and wherefore of facts which were known to practice a thousand years before what we call science existed.

The danger of dogmatism is well known by the story of a physician who, while lecturing before a non-professional audience, said that grippe is always caused by wet feet. A man in the audience thereupon got up and stated that he had just recovered from a severe attack of that malady, but that he had gone about upon two wooden legs for several years.

ARTHUR SMITH.

#### THE LATE JOHN MUNSON.

John Munson, the genial, well-known proprietor of the Minneapolis Floral Company, of Minneapolis, Minn., passed away at his home on the evening of December 28 after a short illness. He was taken sick a few days before the holidays but was reported better on Christmas day, and the report of his death came as a shock to his many friends. Mr. Munson was forty-eight years old and was well known to the trade. He came to this country twenty-two years ago from Sweden, his native home. He acquired his knowledge of the profession in Sweden and Denmark when a youth, and three years after coming to this country started in business for himself at his present establishment, which is now one of the largest of its kind in the state. Mr. Munson is survived by his wife and adopted daughter. The services were held at the Lakewood Cemetery Chapel on December 31. The floral pieces were numerous, testifying to the esteem by which he was held by his many friends.

#### HOLLAND NURSERY STOCK NOT IMPAIRED.

One of the nurserymen at Oudenbosch in the Netherlands (Holland) has been informed that people in the United States are concerned about the quality of the Holland nursery stock which they believe to have greatly suffered from inundations.

It was rumored that the greater part of Holland was either inundated by salt or by fresh water, in which case the trees, etc., in the nurseries would of course

have suffered considerably.

The weekly "De Tuinbouw," which is officially published by the Netherland Horticultural Council, states that buyers abroad can be assured Netherland nursery stocks, shrubs, trees, bulbs, roots and all other kinds of plants are this year of the same quality as formerly.

If the report were true, nurserymen would of course have requested cancellation of their agreements, in order not to endanger their future reputation.

### OF INTEREST TO ALL

#### NEW YORK FLORISTS' CLUB.

The January meeting of New York Florists' Club was Installation Night. President Bunyard after being welcomed to the chair by the retiring president, Wm. H. Duckham, delivered his inauguration address.

He said in part:

"As president of your club, it is my desire to try and uphold its traditions and carry on the work, ideas and high standard of achievement, as laid down by the men who organized and continued it. Most of these men are still living and doubtlessly feel that their work has not been in vain. They should have our sincere thanks. I want my administration to be creative, constructive and progressive and to carry out especially one idea that is not new, but of great moment to the members. That is, for the New York Florists' Club to have and own a permanent home. where we can meet for social and business intercourse, hold our meetings and entertain our out-of-town members and friends; a home built for posterity. It is possible!

"For progressive legislation, affiliation is but the beginning. will broaden and grow as time flies. It is an epoch in this club

at which you will be able to point with pride in the near future.

"In union there is strength,' and while the S. A. F. & O. H. has given us this opportunity, cannot we look around in our vicinity and see if we, too, cannot offer the right hand of fellowship. I note in the property of the light hand of fellowship. that the president of the New York Florists' Club is an exofficio member. This club has leased from the city of New York
the Bartow Mansion situate in Pelham Park, near City Island: have appropriated money to build roads and have already plans in hand for a rose garden and other specialized work. Are you aware what all this means to you? It means primarily that the masses are to be educated along the broader sense of gardening. It means that we are to have a new generation of flower and plant lovers and in time you will become the indirect beneficiaries through increased business; besides this, there are horticultural societies and school garden associations at our door that should at least have our moral support. I would recommend a committee to report upon the number and membership of these societies and their objects, for possible affiliation in some form or other.

"The International Flower Show next March affords unrivaled opportunities for the trade to exhibit and advertise their wares. There should be no waning of interest in this important event. With the clouds of pessimism of 1914 passing away with the advent of New Year, we must gird our armor on and by will and deed make it a success or we shall be held strictly to account. Many other industries are only too glad to seize an opportunity to take part in such an enterprise. So I say, wake up! So let us inject new life, new hope, new stamina into a cause so worthy and with interests so much identified with our own, let us all pull

together for our own common good.

"Our membership is now 464 and includes 156 S. A. F. & O. H. members in good standing. New membership is always in order and we desire all the members we can secure, but our main effort must be to get what members we now have attend the meetings. We must have a sustained interest; we must keep it alive. In plain English, we must have our members satisfied and harmony prevail. I have enlarged some of the committees. Our increased membership and organization demands it; we must broaden out. We must be creative, constructive and progressive. Our motto is, 'All one,' with a Rose for an emblem. The Rose is partly expanded; so, like the flower, let us too expand, but never fade and make our membership for 1915 five hundred or more."

#### **New Everblooming WATER LILIES**

Water Libes every day in the year. This is now possible with these tew Hylads. No better flowers for cutting, shipping or lasting qualities. Awarded a Salver Medal by the Philadelphia Herticultural Society, Nov. 3, 1914. Certificated at New York, Lake Geneva, Wis, and Chicago. Everything in the line of new, rare and choice Nymphicas et all species and varieties known in cultivation.

Send for my book "Making a Water Garden", 550 prepaid. My calalogue will be mailed free on application.

#### NEW BEDFORD HORTICULTURAL SOCIETY.

At the annual meeting of the New Bed ford Horticutural Society officers were elected as follows:

President, David F. Roy; vice-president, Frank C. Barrows; financial secretary, Walter K. Smith; treasurer, Walter A. Luce; secretary, Jeremiah M. Taber. Executive Committee Frank G. Tripp, chairman; C. W. Young, Jas. H. McVicker, Joseph W. Webster, A. E. Griffin, James Gathby, L. J. Hathaway, Jr.

The Executive Committee rendered the

following report:

"We have within the past year run four free flower shows; a peony show and a rose show in June, a dahlia show in September and a chrysanthemum show in November. All the shows were very successful, and were much appreciated. We gave a large number of prizes, which were in most cases donated by friends of the society and tradesmen.

"The committee at this time wish to express their thanks to the friends who contributed so liberally to make our efforts successful.

"The committee also wish to express their thanks to the members and friends who so generously contributed flowers and plants to make these shows the wonderful displays they were.

"The president, David F. Roy, gave a silver cup for professionals, and William F. Turner gave a silver cup for amateurs. These cups were awarded to the members scoring the highest number of points for exhibits at the monthly meetings during the outdoor season, and had the effect of bringing out some very pretty displays of flowers at our meetings.

"The Entertainment Committee furnished a number of able speakers at the meetings. who spoke on different subjects interesting to horticulturists. A large number of new members were added to the society.'

#### TUXEDO HORTICULTURAL SOCIETY.

The annual business meeting of the Tuxedo Horticultural Society was held in the Firemen's Club on Wednesday evening. January 6. President David McIntosh in the chair. There was a large attendance of members present. The treasurer read his report for the year 1914, which was very satisfactory, and showed the society to be in good condition financially.

Burpee's Annual for 1915

as follows: President, Frederi k Rake: vice- | Sorosiek cultural certificate for Cauliflower, president, C. Davidson; treasurer, Simon Hilmers; secretary, Thos. Wilson. Execu-Hilmers; secretary, Thos. Wilson. Executive Committee—Messrs. Tansey, Millar, J. Davidson, Barth, Sheppard, president and secretary. After the usual business was finished we adjourned to the bowling alleys and enjoyed three hours bowling, some of the boys putting up good scores, after which we sat down to a fine supper and satisfied the inner man amid a nice social evening spent with speeches, songs, recitations and good stores.

THOS. WILSON, Secretary.

#### TARRYTOWN HORTICULTURAL SOCIETY.

The annual meeting of the Tarrytown Horticultural Society was held at Tarrytown Thursday evening, December 31, President Elliott presiding.

This being Carnation night, a fine display of cut blooms was exhibited. First prize, for three varieties, 6 of each, was awarded to A. Golding (Superintendent D. G. Reid). who also received certificate of merit for a vase of Princess Dagmar and cultural certificate for a vase of Mignonette. Honorable mention was given to Mr. J. W. Smth, Scott Brothers, A. Weeks and M. F. Ross for other exhibits of Carnations. A fine vase of Euphorbia was staged by Mr. Weeks, which received a cultural certificate.

The following officers were elected for the coming year; W. Jamison, president; J. Featherstone, vice-president; E. W. Neubrand, secretary; C. J. Weeks, treasurer; Thomas A. Lee, presiding secretary. Many valuable points were brought out on the cultivation of Carnations through the discussion which followed the judging.

The exhibit for next meeting will be flowering plants in not more than seven pots.

The annual dinner will be held at Florence Inn January 12 at 7 p. in. T. A. LEE, Pres. Sec'y.

#### OYSTER BAY HORTICULTURAL SOCIETY.

The December and annual meeting of the Oyster Bay Horticultural Society was held in Fireman's Hall, Oyster Bay, L. I., on December 23, 1914. About thirty members were present and Mr. John T. Ingram pre-

Communications were read offering prizes for the summer shows, Mr. J. Roscoe Raynor \$5 to be used at the discretion of the Society; Mr. John T. Ingram offering \$10 for collection of outdoor roses, one each of eighteen varieties: Mr. H. C. Smith \$5 to be used at the discretion of the Society.

The Dinner Committee reported the dinner held at the Oyster Bay Inn on December 17 as a great success socially and financially.

Mr. Robinson, Mr. Duthie and Mr. Walker were appointed as a special committee to buy books on gardening, etc., to start a cir-

culating library.
Mr. Chas. Mills was elected an active member.

On the monthly exhibits the judges made the following awards: First prize, vase of six Antirrhinums, Mr. F. Kyle; three Celery, Mr. Jas. Duthie; fifty Violets, Mr. Jas. Duthie; Mr. Jas. Duckham, honorable men-The election of officers for 1915 resulted tion for Spiraea, Philadelphia; Mr. John

Very faverable reports were made by the officers and accepted as read.

The election of officers for 1915 resulted as follows: President, Jos. Robinson; vicepresident, Jas. Duckham; treasurer, H. G. Vail; financial secretary, F. Gale; secretary, Andrew R. Kennedy; trustee for three years, A. Walker; Executive Committee— John Sorosick, F. Kyle, A. Patton, John T. Ingram. F. Gale, A. Dawson, G. De Graff.

All officers were duly installed and made

appropriate speeches.

Exhibits for the next meeting, to be held Wednesday, January 20, 1915, twenty-five sprays of Sweet Peas, one pot of Cineraria and six stalks of Rhubarb.

After meeting adjourned all partook of cigars and refreshments provided by the Executive Committee.

Respectfully submitted, ANDREW R. KENNEDY, Secretary.

#### MEETING EXECUTIVE COMMITTEE AMERICAN ROSE SOCIETY.

The Executive Committee of the American Rose Society had a full meeting at the office of Traendley & Schenck, in New York City, on the 14th.

Mr. Thomas Roland, on behalf of the Massachusetts Horticultural Society extended an invitation to the American Rose Society to hold their annual exhibition and meeting in Boston on March 25, 26, 27 and 28, the same being accepted.

The exhibit in pots and tubs to be made on the 25th and cut roses to be staged on Friday, the 26th. The committee to act with the Massachusetts Horticultural Society in preparing a premium list are: Louis J. Reuter, Westerly, R. I.; Thomas Roland,

# THE ANDORRAWA

of growing shade trees, evergreens and shrubs is to transplant again and again, with the greatest care and skill, so that the specimens produced by the Andorra way will give beautiful effects from the moment they are planted around your house or over the estate.

Our booklet, "Distinctive Trees and Shrubs," shows the advantages of large sized Maples, Lindens, Oaks, Spruces, Hemlocks, many desirable Shrubs, Roses and Hardy Perennials. Write for a copy-we will send it on request.

#### Andorra Nurseries

Wm. Warner Harper, Prop.

Philadelphia, Pa Box O, Chestnut Hill

Nahant, Mass., and Alex. Montgomery. Natick, Mass.

A special committee was appointed to solicit premiums, and is composed of the following: Louis J. Reuter, Westerly, R. I.; E. Allen Peirce, Waltham, Mass.; Eber Helmes, Montrese, Mass.; S. S. Pennock, Philadelphia, Pa.; Wallace R. Pierson, Cromwell, Conn.; Frank Traentley, New York City; Patrick Welsh, Boston, Mass.; E. G. Hill, Richmond, Ind.; August F. Foehlmann, Morton Grove, Ill.; William F. Kasting, Buffalo, N. Y.

Vice-President Pyle movel the consideration of the appointment of committees for governing Rose Test Gardens, and the following committees were appointed:

The Central-Rose Garden Committee are: Alex. Cummings, Jr., chairman, Cromwell, Conn.; Thomas N. Cook, Watertown, Mass., and Wallace R. Pierson, Cromwell, Conn. The Committee for the Washington Test Gardens are: Robert Pyle, chairman, West Grove, Pa.; Admiral Aaron Ward, Roslyn, N. Y., and Charles F. Tansill, Washington, D. C. The Committee for the Cornell Test Gardens are: A. C. Beal, Ithaca, N. Y.; John Watson, Newark, N. Y., and Rev. Dr. Mills, Syracuse, N. Y. The Committee for the Hartford Test Gardens is John Huss. chairman, Hartford, Conn., and for the Minneapolis Test Gardens Theo. Wirth, Superintendent of Parks, Minneapolis, Minn.

Upon motion it was resolved that in recognition of the action of the Syracuse Rose Society in becoming affiliated with the American Rose Society with its over 300 members the president of the Syracuse Rose Society, Rev. Dr. E. A. Mills, be chosen an honorary vice-president of the American Rose Society. Carried.

The annual bulletin has been started and the intent is to get out the best annual report that has yet been issued. The secretary reported this work well under way,

The number of members of the American Rose Society who belong to the Society of American Florists and Ornamental Horticulturists is 104, and this number entitles the American Rose Society to appoint one of its number as a director on the board of the S. A. F., and who would be the president-Wallace R. Pierson in this case.

BENJAMIN HAMMOND, Secretary,

#### NEW JERSEY FLORICULTURAL SOCIETY.

The regular monthly meeting of the New Jersey Floricultural Society was held in the J. O. U. A. M. Hall, Orange, on Mon-day evening, January 4, 1915. The following officers were elected for the ensuing rear:

President, Henry Halbig; vice-president, Arthur W. Jackson; treasurer, Fritz Bergelund; secretary, George W. Strange; Executive Committee—Henry Halbig, Arthur Jackson, Fritz Bergelund, Geo. W. Strange, Edwin Thomas, William Reid, Charles Ashmead, Frank C. Drews, George Wraight, Max Schneider: Arbitration Committee— Frank C. Drews (chairman), William Reid, George Wraight, John Hayes, Dutuck Kindsgrab: Room and Library Committee-John L. Collins, Edw. A. Manda, Arthur Jackson, Edgar Bownee, Emil Panuske; Essay Committee—George W. Strange, Joseph A. Manda, George Wraight, A. A. Thomas, William Reid; Auditing Committee—Frank Drews Emil Panuska, Alfred A. Thomas,

The society decided not to hold an annual dinner. It was also decided best for the society to adapt for the coming year a scale of points, consisting of six classes, viz..

Class 1—Best orchid plant in flower—1st, 7: 2d, 5: 3d, 2.

Class 2—Best vase of 12 roses or more varieties—1st, 7; 2d, 5; 3d, 2.

Class 3-Best vase of 12 carnations -1st, 2d, 5; 3d, 2.

Class 4 Best foliage or flowering plant 1st, 5; 2d, 3; 3d, 2.

Class 5—Best vase of cut flowers any other than above-1st, 5; 2d, 3; 3d, 2.

Class 6 Best bunch of 50 violets or sweet pens -1st, 5; 2d, 3; 3d, 2.

The winners scoring the highest number of points for the entire eight monthly competitions will secure the prizes.

Awards for the evening were as follows: Class 3-Peter Hauck, Jr. (Gardener Max Schneider), 85 points.

Class 4-Peter Hauck, Jr. (Gardener Max Schneider), 65 points.

Class 5-Peter Hauck, Jr. (Gardener Max

Schneider), 75 points. Class 6 Peter Hanck, Jr. (Gardener Max Schneider), 65 points.

Class 6—Mrs. A. J. Moulton (Gardener Arthur Jackson), 65 points.
Class 4—Mrs. Wm. Barr (Gardener Emil

Panuska), 60 points.

Mrs. A. J. Moulton received Highest Recommendations for plate of mushrooms.

GEORGE W. STRANGE, Secretary.

#### CONNECTICUT HORTICULTURAL SOCIETY.

The regular fortnightly meeting of this society was held in the County Building Hartford, Friday evening, January 8, Warren S. Mason, the new president, presiding for the first time. President Mason announced the following committees:

Executive Committee John F. Huss, G. H. Hollister, W. W. Hunt, Oscar F. Gritz-macher, C. H. Sierman.

Publicity Committee-James M. Adams. Edward Brassill, Alfred Dixon.

President Mason exhibited a fine collection of camellias in various colors. Charizenia Illicifolia and Clerodendron Belforni from the conservatories of Mrs. A. A. Pope, of Farmington. Alex. Cumming, Jr., of the Pierson Greenhouses, Cromwell, staged rare specimens of Buddleia Asitica. G. H. Hollister, C. H. Sierman and Frank Roulier were appointed judges and awarded a cultural certificate to each exhibit.

In President Mason's opening remarks to the society as its new president he touched upon several plans for the coming year. chief of which was a spring flower show for the benefit of the Red Cross or some such society. This brought forth much discussion as to the feasibility of the project, and it seemed to be the consensus of opinion that it could be done, and was endorsed with much enthusiasm. It was voted that the executive committee get together and make arrangements for the show, same to be given the last of May or the fore part of June.

Mrs. Wilhelmina Seliger, of Waverly avenue, was elected a life member of the so-ciety in appreciation of her valuable aid to borticulture through her writings over the signature of "Garden Notes" in the Hartford Times.

Several new members were elected. ALFRED DIXOX, Secretary. Wethersfield, Conn., January 12, 1915.

#### OYSTER BAY HORTICULTURAL SO-CIETY'S DINNER.

The annual dinner of the Oyster Bay Hor-Coltural Society was held on December 17 at the Ovster Bay Inn, Oyster Bay, N. Y. It was in the nature of a beefsteak dinner. and the novel menu served was much enjoyed by all who partook of it.

About one hundred members and friends congregated in the dining room when "din-

ner is ready" was announced. After the din ner was served President John T. Ingram introduced M. C. Ebel, of Madison, N. J., as the toastmaster.

After presenting President Ingram with a handsome smoking set on behalf of the Oyster Bay Society, in appreciation of his successful administration during the past year, the toastmaster called on James Duthie to respond to the toast of "The Gardener," which he did in an admirable

A long list of speakers followed, among whom were Father Kennahan, who in his remarks alluded to the part that the flowers took in shaping the nature of mankind. Representative Harry Howard responded to the toast "Associate Members," L. C. Dis-brow, "Local Press." W. D. Robertson, "National Association of Gardeners." Andrew Kennedy, "The Sporting Seedsmen." Sperling, "Bulbs That Grow." John John Hav "The Traveling Seedsmen." Charles Plum, "Horticultural Past and Present." Others among the representative local business men present called on were: R. W. Deville, John Burke, John Birmingham, G. B. Powers, John Remson.

During the evening Toastmaster Ebel presented Frank Petroccia with the Stumpp & Walter Company's cup won by him at the Fall show with an exhibition of a fine col-

lection of vegetables.

Excellent instrumental and vocal talent were provided. When the members finally arose to join in "Auld Lang Syne" it was the unanimous opinion of those present, who had attended the previous dinners of the society, that it was the most successful ever

#### TARRYTOWN HORTICULTURAL SO-CIETY'S DINNER.

Despite the stormy weather a large attendance gathered at the eighteenth annual dinner of the Tarrytown Horticultural Society at Florence Inn. Tarrytown, N. Y., on Tuesday evening, January 12. The dinner was said to be the most successful ever given by this society. The dining room was beautifully decorated with the floral art. some fine blooms and specimen plants mak-

ing up the table decorations.

After the dinner, which was an excellent one, was over President William Jamison of the society introduced F. R. Pierson, who reviewed the history of the Tarrytown Horticultural Society and its past and present services to the village of Tarrytown, following which he introduced John F. Dinkle as the toastmaster of the evening. A number of public men present were found to be notable after-dinner speakers, who held the interest of their audience.

Harry A. Bunyard, president of the New York Florists' Club; John W. Everitt, president of the National Association of Gardeners, and others, representing horticultural pursuits, were among the speakers. Among the visitors present from the sister societies were Ernest Westlake. John Jones, of the Nassau County Horticultural Society; Arthur Jackson, George W. Strange, of the New Jersey Horticultural Society: F. Goldberg, J. Newman, of the Dobbs Ferry Horticultural Society. The local gardening fra-ternity was well represented by many members of the society who were present.

# HORTICULTURAL SOCIETY.

There was a very large attendance of members at the regular monthly meeting of the Westchester and Fairfield Horticultural society, held in Greenwich, Conn., Friday evening, January 8. A feature was the installation of the newly elected officers for the ensuing year. The names are as follows: President, W. J. Sealey; vice-president, Wm. Morrow; treasurer, Robert Wilhamson; secretary, J. B. McArdle; corresponding secretary, P. W. Popp. Executive Committee-Jas. Stuart, Ewen McKenzie, Thos. Ryan, John T. Burns, Jas. Foster. The omcers each in turn assured the members of the society of their best efforts in the society's welfare. The finances of the society are in a very gratifying state. This, in connection with the ever increasing interest of our members and the adoption of several additional features of interest that are being contemplated, assures the Westchester and Fairfield Society a very enviable place in the horticultural world. We wish place in the horticultural world. at this time to thank our many friends for the generous support rendered to us in the past, and hope to merit a continuation of the same in the future. Two new members were elected at this meeting and several proposals for membership were received and filed. It was decided to hold the annual summer exhibition in June, the dates and location to be decided later.

A committee was appointed to complete final arrangements for the annual entertainment and dance to be held in February, the date and location of the hall to be an-

nounced at an early date.

The lecturer scheduled for the evening, Mr. Neil Morrow Ladd, president of the Greenwich Bird Protective Society, entertained the members with a very interesting and instructive lecture on the methods of attracting the wild birds about the home grounds. The speaker used some very fine colored views to illustrate the various methods of winter feeding, as well as a number of clever devices for sheltering the birds during the severe weather. A rising vote of thanks was accorded the speaker for the very timely and enjoyable lecture. subject is a very broad one and worthy of the serious consideration of all horticul-

The competition for the secretary's prizes for the best eighteen carnations, three varieties of six each, caused a truly markable display to be staged. All the older favorites were on exhibition as well as all of the best varieties of recent introduction, and all of a quality that was not to be surpassed. The competition was very keen and the decisions were close. judges awarded the first prize to Thomas Ryan, second prize to John Canning, third prize to Robert Grunnert. The remaining competitors were each awarded a very hearty vote of thanks for their splendid display. In the non-competitive classes the judges made the following awards: To Samuel Bachelor, manager of the Amohat Greenhouses at Mamaroneck, N. Y., cultural certificate for a magnificent vase of carnation "Gorgeous," and who was also highly commended for each of several very fine vases of carnations. Display of carnations from Thomas Aitcheson, vote of thanks. Vase of seedling carnations from A. Wynne, highly commended. Vase of assorted carnations from Thomas Ryan, vote of thanks. Vase of carnations "Mrs. Darlington," a variegated yellow and pink sport of Mrs. C. W. Ward, from P. W. Popp, was highly commended. Vase of Killarney roses from Carl Hankenson, vote of thanks. Alex. Marshall was very highly commended for a very fine vase of orchid blooms. Robt.

THE WESTCHESTER AND FAIRFIELD Williamson was highly commended for a specimen plant of Cypripedium Insigne. W. Popp was highly commended for a specimen plant of Buddleya Asiatica. Bunch of rhubarb and plate of tomatoes from Robert Grunnert received a vote of thanks.

A feature of the next meeting, to be held February 12, will be a lecture entitled "Conferous Trees," by James Kelly, of New Canaan, Conn. The speaker is well qualified and we anticipate an interesting talk.

For the next meeting Mr. John Canning offers a cash prize for the best vase of roses,

any variety.

Members of the society will please take notice that the monthly meetings will start promptly at 7:30 o'clock p. m., thereby enabling all those who come from a distance to remain at least throughout the business session. A bright and prosperous New Year to all. P. W. POPP,

Corresponding Secretary.

#### NORTH SHORE HORTICULTURAL SOCIETY.

At the last regular meeting of the North Shore Horticultural Society, Manchester, Mass., Frank S. Gifford's lecture on "Breeds of Cattle" was both interesting and instruc-With the aid of a map of Europe, tive. Mr. Gifford traced the course of various breeds of cattle from Egypt and the north of Africa northward and westward through Europe and across to Canada, the United States and the South American republics.

A silver medal was awarded to Vice-president E. H. Wetterlow for six seedling primulas, a cross between Primula Chinensis fimbriata and Primula stellata, all mauve in color, the same as the parent plants. All the plants were well grown. The foliage was of the stellata type, with long stems, and the flowers were large, of the fimbriata type. A certificate of merit was awarded to Ernest Townsend for a fine plant of Cypripedium insigne in a 10-inch pot.

The sixteenth annual banquet of the soenty will be held in the Town Hall, in this city, January 27, at 6:30 p. m. The banquet will be served by Jesse A. Dill, of Melrose, and will be followed by an entertainment by professional talent, and dancing from 10 to 12 m. Tickets will be \$1.50 each, and can be obtained from the chairman of the committee, William Till, Magnolia. Mass. Any visitors in this vicinity will be given a cordial welcome.

The feature of the next meeting will be a stereopticon lecture on gladioli by B. Hammond Tracy, of Wenham.

Corresponding secretaries of the local societies are invited to send reports of their meetings. Those received by the 15th of the month will be published in the current issue.

# LAWN MOWER Combination Mower and Roller

38-inch cut \$400

This newest machine is larger and more powerful than the 1914 model, and carries many improvements that will interest those who have the care of large lawns—golf courses—parks, etc.

A 5 horse power motor (S. A. E. rating) with 6 adjustable cutter blades, 38 inches wide, and a roller 15 inches in diameter, it cuts 8 acres per day at a speed of one to  $4\frac{1}{2}$  miles per hour, at an operating cost of only 30 cents per day. It climbs 35% grades, cuts closely and evenly, is easily guided around walks, trees and shrubbery, and rolls the turf as well as cutting the grass, leaving the lawn in perfect condition. Neither hand propelled nor horse drawn mowers can compete with this machine in satisfactory results, economy of operation and all-round efficiency.

The **IDEAL JUNIOR**, a smaller power mower, for \$225.

# STAIGREEN LAWN SEED

For Lawn Making few months in the year are considered as advisable as August or early September. While the proper preparation of the ground, fertilizing, rolling and watering is considered very essential, the mixture of grasses is a very important one and should be given considerable thought.

# 25-Pound versus 14-Pound LAWN SEED

Many low-price Grass Seed mixtures weigh only 14 pounds per bushel. This indicates either a good proportion of chaff or some of the real good varieties in the rough state, not properly cleansed so as to leave only the vital part and less of the chaff or shell. In other words, so many less seeds to the quart or pound that will germinate and grow real grass.

# Why Not Buy the Re-cleaned Kind?

A mixture of grasses weighing 25 pounds per bushel, of high germination and purity, permanent in nature, the varieties carefully proportioned so that they will succeed one another in brightness of foliage, with the result that the lawn, even in its first year, will have a bright, rich green color from early spring until covered by snow.

# Spokane's Interesting Park System

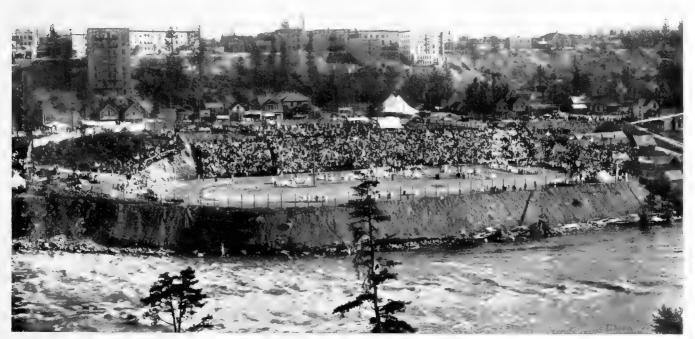

By John W. Duncan,\* Washington.

The city of Spokane lies in a beautiful valley among the pines, on the western edge of the Northern Rockies of the United States. The first settlement was made in 1872, and at the present time it has a population of 132,000.

In the year 1891 Spokane's first public park, known as Coeur D'Alene Park, was donated to the city and for several years after the park area was gradually

seven years of progressive administration, the city has a park area of 1934 acres.

Spokane has been fortunate in having as leader in its park development, Aubrey L. White, to whose broad views and untiring efforts are largely due the wonderful accomplishments that have been attained in the past seven years. Hampered by lack of funds for several years after the creation of the Park Com-

OPENING OF SPOKANE'S STADIUM THOUSANDS OF PEOPLE WITNESSED THE EVENTS ON CHILDREN'S DAY.

increased by donations, without particular regard for future consideration as to locality or public requirements.

It was not until the year 1907, when an amendment to the city charter, creating an independent non-political park board was passed, that any activity was taken in Spokane's Park and Playground System. At that time, when the Park Commission assumed control, there were 173 acres of park lands, and now, after

\*Superintendent of Parks, Spokane, Wash.

mission, it was really not until the beginning of 1912, when a bond issue of \$875,000 became available for park purposes, that any apparent activity was shown in the park work.

Although at first hampered by lack of financial facilities, soon after the creation of the commission the firm of Olmsted Bros. was engaged to make a general survey and report on a comprehensive park system for the city of Spokane. From this scheme the Park Commission went quietly to work, and so thorough

were the methods carried out by its president and others that a large number of donations were secured and considerable suitable property was purchased at reasonable figures.

It has been the endeavor of the commission to secure as much as possible of the close-in properties as would fit into the general scheme, and so well has this been accomplished that, with one or two exceptions, all the districts are taken care of, all having a park or playground within easy reach.

It has been the purpose also, to secure much of the rugged natural lands and river banks, so that as much as possible of the basaltic cliffs and river embankments would for all time be preserved in their most natural condition, a boon to the generations that are to follow.

In the work of development, in reality only a start has been made. It has only been during the past three years that anything comprehensive has been undertaken, but so vigorously has the work been prosecuted that the Park System now boasts of a number of finished neighborhood parks, eight fully equipped playgrounds, and a large number of baseball fields and tennis courts, distributed in different localities throughout the city.

It should be remembered that Spokane lies in a semi-arid district with a maximum annual rainfall of 18 inches, and that as there is little or no rainfall during the summer months, all plantings of trees, shrubs, lawns, etc., therefore have to be watered and no attempt is made at such development without a perfect watering system. This makes construction work expensive, but a few years show the benefit from the cost, for there is no losing of foliage from deciduous trees in mid-summer, so often seen during a dry season in Eastern cities.

It is the purpose of the department to preserve every particular feature that each park may possess, and a brief description of a few of the most interesting features follow:

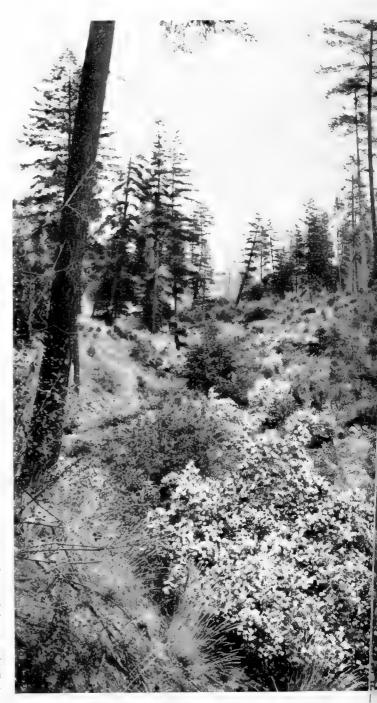

Manito Park, the most popular of our parks, is a beautiful tract of high bluffs and fine rolling knolls and valleys, consisting of about 90 acres, but so far only about one-half has been improved. In this park the Zoo has been located, but space will not permit of its continuance here, and eventually the animal park will be Indian Canyon, perhaps the most artistically natural park of the whole system. At Manito the city greenhouses are also located, a very complete range of modern houses, with a beautiful fronting where the flower gardens are laid out. Manito Park will eventually become a veritable arboretum, for it is intended to gather in it as large a collection as possible of all varieties of trees and shrubs that will stand climatic conditions. Manito Park also contains an old-fashioned garden; also a rose garden; in the latter are grown many of the newer varieties of hybrid tea roses, for which class the superintendent has discarded many of the old hybrid perpetual varieties.

Liberty Park is a natural park of peculiar beauty, situated a little over a mile from the center of the city. Its center is a low depression, said to have been at one time a volcanic crater, while the surrounding slopes have now been covered with many thousands of different varieties of trees and shrubs. At the western end of the park a beautiful pergola effect has been given, surrounding a children's playground and wading pool. Lincoln Park is one of the recently acquired tracts; so far only a little development has been undertaken. It, however, has the distinction of having a splendid growth of Douglas firs, something that no NATIVE PHILADELPHUS GROWING IN INDIAN CANYON PARK, SPOLA

other park so near the city's center is possessed of.

Indian Canyon Park, already referred to, is wholly within the three and one-half-mile circle and connecting with Palisade Park totals 162 acres. Indian Canyon is a beautiful gulch, where much varied scenery may be seen. At the eastern end are many thousands of different deciduous shrubs, among them the philadelphuses, which are so plentiful as to make a special feature. Farther up the canvon are some excellent examples of lava overflow, and a beautiful little waterfall helps to add to the naturally wild effect. A feature, too, are the Indian tepees, for few, if any, cities can boast of the aborigenes living naturally within their border.

From Rimrock Drive, which surrounds the western border of these parks, are many changing views of the city, the Spokane Valley, the distant Coeur

D'Alene, and other mountain ranges. This drive is surpassed by few in any parts of the country.

Down River Park, as the name implies, is a riverbank park below the city, and while much development has yet to be done, the river-bank drives that have been constructed show what nature has provided in furnishing such a river as the Spokane is.

Space will not permit the description of the many

THE FLOWER GROUND AT MANITO PARK, SPOKANE,

small parks like Cliff, where a beautiful view of the city and surrounding country may be had, or Cannon Hill, where a water effect has been made the feature, or Corbin or Hays, where the immense plantings of deciduous trees and shrubs have enhanced what was formerly natural prairie.

In driveways Spokane is well provided for, and High Drive, Rimrock Drive, Elliot Drive, and Down River Drive all have features peculiar to themselves in their various locations, and are only the beginning of what will eventually be a chain of connecting drives with

various parks in all sections of the city. In the development of playgrounds, Spokane has held its own, for in the space of one year eight different playgrounds were equipped in various sections of the city. All play work is under the immediate supervision of a supervisor of playgrounds and each playground is provided with one or more play directors, as conditions require. It has been found that the ideal playground is the park playground; that is, where a playground is wholly within or adjacent to a park. The reason for this is that, connected with a park, a playground can be handled much more economically, besides giving that aesthetic appearance, without which a playground is void of half what it is intended for. The Glass Park Playground gives a splendid example of this idea.

At the Sinto Triangle Playground large outdoor swimming pools have been established, which were opened for the first time the past season. These pools accommodate both men and women, and are provided with bathroom and locker accommodations, life savers, etc. Consideration has been given to all sorts of athletics, with the result that plans have been made for an extensive stadium within five minutes' walk of the center of the city. This stadium site has been partly graded and temporary bleachers have been built along two sides of it. The justification of this was shown the first opening day, when many thousands of people witnessed the events of the children's day.

THE PLAYGROUND AT GLASS PARK, SPOKANE

Spokane is on the direct route of the three northern trans-continental lines, with through trains of several others, and visitors to the Pacific coast should by all means plan to stop over and see this city of parks and artistic homes, of which its citizens are justly proud.

#### CONIFERS.

Strange as it may seem, it is nevertheless a fact, that there are a large number of otherwise well-informed people who do not know what the word means. It is the appelation of an order of trees, the sap of which is resinous, mostly evergreen, the seed of most species borne in cones, made up of scales. The word is derived from the Latin, conus, cone, and fero, bear; hence, conifer or cone bearing.

The flowers are uni-sexual, inconspicuous and intensely interesting to the student of nature. It would be interesting to know how many people who grow this class of trees have ever taken time to study their inflorescence, and learn the difference between the pistillate and staminate flowers, both borne on the same tree, therefore known as monoecious, a Latin word, which, when freely translated, means two families in one house.

All the members of the tribe, with few exceptions, are drouth resistant, and we believe that most people will agree to the proposition that they are all beautiful, all highly desirable for beautifying the landscape, and should be more extensively used than they are at present.

# The Proper Care of House Plants\*

By F. E. Palmer, Massachusetts.

When we consider how much pleasure may be gathered from the cultivation of flowers and with what tender and affectionate regard they are held by almost everyone who has once become acquainted with them, it is surprising that the study of their habits and needs

is not more thorough and general.

In pursuing this study, we will consider first the fundamental requirements of all plants and how nearly we may reach ideal conditions in the average home. The most essential need is light, direct sunlight if possible; at any rate, daylight and plenty of it. This fact is so important that it cannot be overestimated. Indeed, it is safe to say that if this one condition is granted, all others can be so easily provided as to make success assured with very little effort. This will be worth remembering in every phase of gardening experience. It will cause you to pull aside curtains and roll up shades in the early morning so that the plants in the window may get the first bit of daylight. It will warn you against placing window boxes under awnings or flower beds, in the dense shade of trees, and even the hardy shrubs will be given their fair share of the blue sky overhead.

Apropos to this particular phase of the subject is the fact that many householders, having become disappointed at their inability to really grow plants and flowers in their living-rooms, have improvised plant rooms out of existing sun parlors or enclosed piazzas or have built a small addition to the house for this particular purpose. These, if properly designed, are proving most successful, not only as conservatories where plants will really thrive, but as most delightful sitting rooms. Indeed, the combination of sitting room and conservatory is the principal charm of this arrangement, differing entirely from the old-fashioned elaborate and expensive conservatory which at best was a thing apart from the home. It is safe to predict that in the near future very few houses of any pretension will be designed without this charming feature being

considered an essential part of it.

Coming back to the regular living rooms, which is where our immediate interest lies, and still having in mind the question of light, it is quite possible to keep a variety of plants in comparatively healthy condition in rooms on southeast or southwest corners with good-sized windows on both sides, provided one is prepared to consider their needs as of first importance and is willing to give them the constant attention that every living thing requires. This attention should begin by removing every bit of shade such as roller curtains and draperies as soon as the first daylight appears and allowing the window throughout the day to fulfill its one essential function, which is to admit daylight to the room. With a room thus flooded with light, many foliage plants will thrive even at considerable distance from the windows; in fact, some plants have a marvelous capacity for adapting themselves to conditions that are far from ideal. Some instances of this adaptation, which refers to foliage plants only, will be given later when discussing individual species and varieties.

Flowering plants, on the other hand, are most exacting and will tolerate no position short of the immediate window sill.

\*Extracs from a juper real before the Massachusics Horticultural

The need of proper watering may be mentioned next. How much water and how often to be given seems to be a process in plant culture more difficult than any other for the average grower to understand. The trouble seems to be that plants have been classified by species rather than by individuals in regard to their need of water. Does a begonia need more water than a primrose, or a cyclamen more than a geranium? is invariably the form of the question. As a matter of fact, with the following three conditions existing, it is almost impossible to overwater:

1. A plant with a relatively large amount of foliage

and blossom in a small pot.

2. A warm room with very dry atmosphere.

3. Effective drainage in a pot which allows all su-

perfluous water to drain away quickly.

On the other hand, if a plant is in an over-size pot, especially when the earth has been insufficiently 'firmed" down, it is very slow to dry out. The soil in this case is like a loose sponge and remains saturated for a long time. No amount of drainage will help much under these conditions and if, as is often necessary, the plants are all kept in saucers, it will be almost impossible to keep these overpotted ones in good health. Even with all conditions ideal, it is impossible to lay down a rule as to frequency of watering. The successful professional grower relies entirely on his daily observation as to when a plant needs water, the only aspect and light color of pot and soil being his principal guides. Stern necessity has trained his eye to be very keen in this respect; with the amateur, an equally strong desire to success would quickly have the same result. Before dismissing the subject of watering, it must be admitted that certain species are found naturally in swampy places and others in very dry ones. In spite of this, however, it is a fact that most of the former will adapt themselves to ordinary environment with a moderate amount of water and that others which are not in any way aquatic by nature will also live for years under the same conditions. This statement does not include of course such extreme species as the pond lilies on the one hand or cacti of the arid plains on the other. At any rate, neither of these are interesting as house plants, and the fact still holds good that it is impossible to lay down a special rule for the watering of particular species of plants.

There is no royal road to the successful cultivation of flowers, even under favorable conditions, much less of with the serious handicaps which have been indicated. It is not a question of formulas or of higher education, of deep studies in botany or of soils or fertilizers, or does it involve the abstruse questions lately set forth by some impressionist biologist as to whether plants shudder or weep or laugh and clap their hands when you come into their presence, it is simply whether you care enough for them to give some time to their study and to supply their needs just as one would to a child or a highly-prized dog.

The use of saucers in which to stand potted plants may be a benefit or an evil, according to the degree of intelligence exercised. Some provision of course is necessary to prevent water which runs through the pot from injuring the flooring or furniture. On the other hand, many plants suffer from standing saturated all the time in a saucer full of water. This evil

small pebbles; in fact, the very best arrangement for a group of window plants is to provide a shelf the full length of the window and about twelve inches wide. Cover this entirely with a flat tray of galvanized iron two inches deep, filling it with a layer of white pebbles 1½ inches deep. Plants standing on this may be watered without any fear of overdoing it. The superfluous water runs in among the pebbles and quickly evaporates, so that there is no need of providing any special means of drawing it off. This constant evaporation is of great benefit to the plants and the whole affair is neat and practical.

In the matter of heating and ventilating the room, plants have to put up with what they can get. Excessive heat is perhaps second in the list of unfavorable conditions to which house plants are subjected. This is aggravated by violent extremes caused by throwing open windows when airing the room and by a draft blowing in around a poorly fitting sash. This latter continuing through every cold night is sufficient to destroy a whole window full of plants during the winter. Every window devoted to plants should be double glazed and great care used in airing the room on very cold days. Valuable palms are often destroyed by allowing an icy draft from an open window to strike them. Only a few minutes are necessary to accomplish this destruction, when the temperature outside is much below freezing. It is well to remember that all plants are benefited by comparatively low temperature at night, so that if circumstances compel us to subject them to a temperature of 80 degrees in the day, we should give them a rest at night by lowering the room to 60 degrees.

#### ORCHIDS.

Washington, D. C.—Probably there is no flower in the whole plant world which is admired more and understood less today than the orchid, the development and cultivation of which are discussed by J. Costantin in a paper of the Smithsonian annual report. Even the simpler orchids are very curious plants, of the so-called endogenous type, belonging to the same group as the lilies, palms, and grasses, but differing from them greatly in having showy and often highly colored flowers of remarkably diverse forms. Upon entering a house filled with orchids one is literally amazed by the bizarre display; the brilliance of color, and the peculiar forms of leaves, petals and roots. The number of known species is greater than that of any of the related families, even not excepting the grasses, totalling 6,000 species, included in 400 genera. This great number is, no doubt, due very largely to the diligent search which has been made for these plants in all countries, for purposes of cultivation, on account of their beauty and very great popularity. They have otherwise very little economic value, excepting a few members, such as the vanilla plant, from which the well-known extract is prepared.

Some of the orchids are terrestrial; that is, they grow with their roots in the ground. The great majority, however, including most tropical species, are epiphytes-"air plants"-which grow on trees and shrubs, but receive no nourishment from them. This peculiarity was chiefly responsible for the difficulty which was experienced in successfully growing many species upon their introduction into Europe from Asia and Malaysia in the eighteenth century. The proper mode of cultivation was perfected little by little, however, as soon as the necessity was realized of repro-

can easily be obviated by filling a saucer half-full of ducing artificially the conditions under which the plant grew in nature. For most epiphytes the scheme was devised of fastening the roots to a piece of wood, together with a little moss or absorbent peaty substance, by means of copper wire. Plants thus prepared were hung in very warm greenhouses and kept constantly moist by frequent drenching. It was supposed that tropical plants required an invariably hot humid atmosphere; and it was not foreseen that mountain species of tropical regions could not be treated essentially like tropical plants that are accustomed to elevated temperatures.

There are, in fact, many orchids, and some of these very beautiful, which grow in the neighborhood of snow. The error of associating plants from widely different surroundings was finally recognized and eventually more rational methods of cultivation developed, leading to the usual separation of orchids in three kinds of greenhouses, according to temperatures maintained in them-hot houses, temperate houses, and cold houses. Many of the finest orchids

are found in the last.

The writer also discusses at some length the wonderful creations in the shape of artificially produced hybrids, in which the new plant not infrequently differs greatly from both parents. Some of these are extremely beautiful, as well as peculiar, and the difficulty of their production is such that they command extraordinary prices, as high as \$1,500 having been paid in a single instance.

#### CATTLEYA GIGAS SANDERIANA.

The plant from which the photograph here reproduced was taken is that of the free flowering type of Cattleya Gigas Sanderiana. It was recently exhibited by Robert B. Allen, superintendent of Lakeside Gardens, Alberon, N. J., at the meet of the Elberon Horticultural Society, where it was awarded a cultural certificate. At the time the plant was exhibited it carried twenty-eight well developed flowers, which is remarkable for a plant of its size, being grown in a 7-inch pot. The plant came from some stock imported by Joseph Manda, of West Orange, N. J.

SPECIMEN CATTLEYA GIGAS SANDERIANA.

#### MAKING A VINE BORDER.

BY C. E. CARMAN, NEW YORK.

One of the most essential points in connection with the successful culture of grapes is to have the soil in which they are to grow well drained. For that reason the vinery should not be built in a low water-logged spot, especially if the subsoil is of a clayey retentive nature. If the house is to be planted with grapes for very early use the border should be wholly inside, for midseason and late grapes the roots can be allowed to run outside, in that case a border must be made outside in the same way as the inside border. To allow the roots to get to the outside border, the front of the house should be built on pillars or arches, either of which should extend downwards to the bottom of the border. Pillars are preferable to arches as there is less obstruction to the root run. If the house is built on a well drained subsoil, the draining of the border is comparatively simple, but if of a clavey nature it will be necessary to concrete the bottom, partly to facilitate drainage, but also to prevent the roots from finding the cold, sad, clav.

If the border is to be wholly inside it should extend eventually the whole width of the house. The depth of soil should be from 2 feet to 2 feet 6 inches at the front to 3 feet to 4 feet 6 inches at the back; that is, assuming the house is a lean-to. If a span roof house and vines are to be planted both sides, then the deepest part of the border should be in the center of the

house.

Beneath the soil should be from 6 inches to 1 foot of drainage (according to the depth of border) in the form of brick-bats, broken stones, etc. If concrete is necessary, this should be 3 inches thick, finished off fairly smooth and with a slope towards the main drain. The main drain should have a good fall to ensure the border never being waterlogged. When the concrete has set, the drainage may be put in, 2-inch or 3-inch tile should be laid diagonally, sloping towards the main drain, the tile should of course be laid dry, with one-quarter inch between each and the lines of tile should be about 8 feet apart. Alongside the tile and over the joints should be placed the largest pieces of whatever is used for drainage (whatever is used should be quite clean), over this the medium-sized pieces and finished off with the small pieces, a layer of crocks is fine for this if one has them. This drainage should be deepest under the deepest part of the border. To ensure the drainage being kept clean as long as possible it should be covered with sod, which should be cut fairly thin, fibrous, well shook and laid grass side downwards; place one layer of this all over the drainage, taking care no loose soil falls on the drainage, then place other sods over the joints, to keep the border soil from finding its way between. A border 4 feet wide is sufficient for the first year, adding one or 2 feet year by year until the whole border is complete. A wall of sods is best to keep up the soil, but it is advisable to sprinkle a layer of lime rubble or similar material between the lavers of sod which will help to aerate the border, and also keep the sod wall open and sweet. Socket tiles should be stood upright on the drainage at intervals of 10 or 12 feet, with the upper end projecting above the finished border; these will also aerate the border.

The soil for the border should consist chiefly of good fibrous loamy turf, chopped up roughly with a liberal addition of crushed bones, lime rubble and charcoal or burnt earth, wood ashes and well-rotted manure. This should all be turned two or three times

to ensure its being well mixed and made firm as the border making proceeds. If one or two-year-old canes are to be planted, these are best planted when dormant; turn the plant out of the pot, and wash all the soil off the roots, then disentangle them before planting; lay the roots out evenly and work some fine soil in between them and finish off level, with the vine stem about an inch lower than it was in the pot. Water with tepid water just sufficient to settle the soil round the roots. If vines from eyes struck the same year are to be planted, these will not be ready to plant before June, when they should have made 3 or 4 feet of growth, and if the border has been made some time before, the soil will be warm and the vines should go away without a check. This latter system is to be preferred, for the roots are not so liable to be damaged, especially if the vines have been grown in sods instead of pots. Muscats like a warm border, therefore the shallower depth as given are more suitable for them.

#### WAR AND POTASSIC MANURES.

By J. Johnson, New York.

The effects of the present European conflict are truly numerous and far-reaching. In horticultural circles alone there have been already complaints raised concerning the seed and bulb harvests, as well as much ado about the temporary cutting off of the supply of that valuable manure, mine potash. Every gardener readily admits the merit of potash in a wellbalanced mixed manure, and most of us know that high-grade fertilizers are of comparatively recent birth. So why worry if the supply of kainit from Germany is temporarily suspended? Our forefathers supplied potash to the soil before the German mines were discovered, and we now must resort to the same methods as they. Consider the value of farmyard manure. This undoubtedly contains a high percentage of potash, and on account of the humus it contains, produces the double effect of rendering a heavy soil more porous and a light sandy soil more retentive of moisture. It has been estimated that a cow in her droppings alone produces annually 20 pounds of potash equal to about 160 pounds of kainit. The urine of the same animal possesses an even greater fertilizing propensity, potash available being four times greater than that of the dung. Unfortunately much of this valuable liquid is lost in the drainage.

Then again, at this time of year there is generally much garden refuse that can be turned to account by burning. Make a "smother" of all weeds, prunings and waste vegetable matter and the result will be a black ash of the most fertilizing nature such as a mere fire will not produce. Burning, it should be remembered, is definitely destructive of whatever garden pests may be upon or about the refuse. The amount of potash in such ashes will vary, but 10 per cent. is regarded as an average which is not much less than

kainit contains.

Seaweed also contains potash in variable quantity. A ton of fresh seaweed contains from 20 pounds to 30 pounds available, while dried seaweed sometimes contains five times the amount of fresh.

Common salt also reduces the need of potassic manure in some cases, but on account of the chloride it also contains being injurious to some crops, salt should be applied with caution. The effect of salt on weeds when used in excess should be sufficient evidence of its destructive character, and this form of potash should never be applied to potato, sugar beet

or tobacco crops, hindering the formation of carbohydrates in the former, preventing ready crystallization of sugar in beet, and in tobacco impairing the quality.

#### VEGETABLE CULTURE A WORTHY STUDY.

By Duncan McIntyre, New Jersey.

The advance in horticulture which made itself conspicuous towards the end of the nineteenth century was not limited to any division or class, while an immense wave of popularity enveloped hardy flowers, fruit growing received a powerful impetus, and vegetable culture moved forward with accelerated speed. There was nothing more conspicuous than the increased attention devoted to truck farming and in the improvement of vegetable culture in private establishments both large and small. This good work was supplemented by the efforts of food reformers, who by showing the beneficial effects on the health of the community of pure fruit and wholesome vegetables encouraged a greater demand for garden products. There is still much to be done in the latter direction when we consider the multitudes of people who feed their families on cheap tinned meats, rather than better themselves to learn and practice the cooking of sound vegetables. No person will deny that the national dietary must be the better if abundance of vegetables are included in it. Every truck farmer who studies his material interests must be a good reformer of a moderate common-sense type.

He will not arouse the opposition of the public by excessive prices for his vegetables, but he will help on any step which encourages the cooking and consumption of sound vegetables. When we consider the value of vegetables is there not reason to fear in the majority of private gardens too much is left to the laborers? Is there not a tendency on the part of the young professional gardener nowadays to neglect the study and still more the practice of vegetable growing? If so, it is regrettable in a measure, perhaps it is excusable, but in the degree to which some carry it is unpardonable. Admitting that the development of hardy flowers, by creating an entirely new system of flower gardening, has formed a new field of study; admitting further that gardening has been specialized to some extent, notably in the matter of orchid culture, thereby adding a fresh item of study to the already long list which the ambitious young practitioner has prepared for himself, it nevertheless remains essential that vegetable culture as one of the stock sections of garden work should have due attention. As a class young gardeners compare favorably with any other that could be named in earnestness and devotion to duty; with few exceptions they are genuinely interested in and bent on mastering the secrets of the old and noble craft, but some of them succumb, not unnaturally perhaps, to the temptation of dismissing vegetable culture as a poor, even contemptible, study hardly worthy of educated people. In their reckless, vulgar and silly language a kitchen gardener is nothing but a cabbage grafter; this is very mischievous, for it nourishes the false impression that the plants we call vegetables are an inferior race. There is as much interest in studying the varieties of potatoes as of phloxes; as much honor in growing a good cabbage as a good cattleya. Then again, in all our cities and towns we have the various flower shows in which vegetable collections have of late been one

of the leading features, and for which very handsome prizes are offered; this alone should arouse the young gardener to great deeds.

Young gardeners will assuredly do well to give the same earnest study to the kitchen garden as their predecessors of the old school did. It is not suggested that they should strive to spend all their time among vegetables, but it is advised with all seriousness that they should learn soil management, manuring, manipulation of tools, rotation of crops and the every-day routine of the kitchen garden. Without this knowledge, how can they properly supervise their laborers? When they secure head places, will they not be absolutely in the hands of their inferiors? So in the interests of our noble profession, let us devote a little more energy in the matter of vegetable culture.

#### THE TIME TO PRUNE PEACH TREES.

The proper time to prune peach trees, according to the United States Department of Agriculture's specialists, is during the dormant period, preferably late winter or early spring, just before growth starts. This is true except in regions where bleeding from wounds is likely to occur, when it should probably be done in early winter.

If the fruit buds are endangered during the winter by adverse temperatures, it may be advisable to delay pruning as much as economic conditions permit until settled spring weather arrives. This is especially advisable if heavy heading in of the previous season's growth is involved, since the proportion of live buds may determine the extent to which the cutting back should be carried.

There is a wide difference of opinion regarding the practice of pruning trees, but the most successful fruit growers usually prune their trees. The principal objects may be summed up briefly as follows:

- 1. To modify the vigor of the tree.
- 2. To keep the tree shapely and within bounds.
- 3. To make the tree more stocky.
- 4. To open the tree top to admit air and sunshine.
- 5. To reduce the struggle for existence in the tree
- 6. To remove dead or interfering branches.
- 7. To aid in stimulating the development of fruit buds.
- 8. To thin the fruit.
- 9. To make thorough spraying possible.
- 10. To facilitate the harvesting of the fruit.

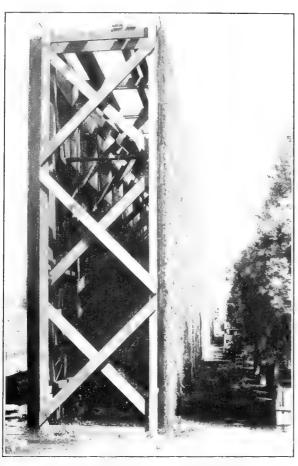

Obviously the pruning which a tree receives during the first two or three years after it is planted has much to do with its future. Mistakes in forming the head or the results of neglect during the early years in the life of a tree are practically irreparable. On the other hand, if the tree is well formed and properly pruned during its first years, the foundation for a good tree is established; subsequent errors in pruning, if they occur, may admit of correction without permanent harm to the tree.

A great many practical pointers on renewing the tops of peach trees, changing the top by budding and grafting, thinning the fruit, controlling insect pests, and on growing some annual crop in between the trees, are included in Farmers' Bulletin (No. 632), which may be obtained by applying to the Editor and Chief, Division of Publications, United States Department of Agriculture, Washington, D. C.

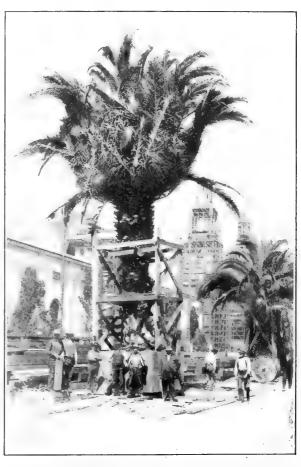

# PANAMA-PACIFIC EXPOSITION FLORAL WALL.

Few of the details of the Panama-Pacific International Exposition are more remarkable than the great "flower garden on edge" or floral wall, 1,100 feet long, 20 feet high and six feet thick, extending from the

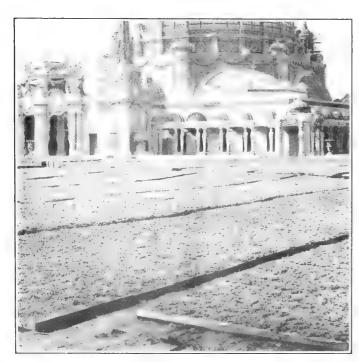

Fillmore street entrance westward to a point opposite the crystal dome of the Palace of Horticulture. This floral rampart, absolutely unique, was the invention of John McLaren, superintendent of gardening, who spent a year in experimenting with sundry vines and flowers, before deciding on employing the many

MESEMBRYANTHEMUM WALL, SHOWING METHOD OF CONSTRUCTION.

A GIANT PALM READY TO BE PLACED IN THE GROUND.

MESEMBRY ANTHEMUM BEDS BEFORE BEING RAISED TO PLACE.
PALACE OF HORTICULTURE IN THE BACKGROUND.

AVENUE OF PALMS IN FRONT OF HALL OF EDUCATION. THOUSANDS OF LARGE PALMS HAVE BEEN PLANTED.

pink-flowered ice plant, known scientifically as me-

sembryanthemum spectabilis.

This barrier is made of 8,700 large boxes of flats, each two by six feet and two inches deep, closely set to plants, and set upon edge, one above another. Chicken wire is tacked over the surface to confine the dirt, and the flats are picked to a wooden trestle work, on both sides of the wall. Irrigation is effected by means of perforated pipes placed on top of the wall. The plants, growing horizontally, are flourishing far better than when set on the ground. The seams were quickly overgrown and the resemblance to a mossgrown wall is perfect.

The wall will be pierced by seven entrances, including an imposing main gate in the Mission style at the main Scott street entrance. This also will be made of

the superposed boxes of flowering plants.

One of the big undertakings in connection with the construction of the exposition has been the transplanting of the mammoth trees. The photograph shows one of the giant palms ready to be placed in the ground, and its size may be inferred by the figures of the men around the base of the palm shown.

The roots of the trees and plants introduced to the exposition grounds are boxed in with the soil to which the plant is accustomed, and after being transplanted to its new home the boards around the roots are removed and the palm or pine is carefully nurtured un-

til its roots take hold in their new bed.

Flowers play an important role in the wonderful color scheme of the exposition. As immensity is the keynote of the architecture, so great numbers of flowers are woven into the canvas of the exposition. There are 50 acres of lawn. A great avenue is lined with 4,000 giant date palms. More than 75,000 geraniums have been transplanted from the nurseries in the 65 acres of gardens adjoining the Palace of Horticulture.

The acacia is now blooming along the buildings. It is the proud boast of the exposition that nearly 6,000 acacias, specially selected in various varieties, will be seen in bloom during almost the entire period of the

exposition.

The 5,000 rhododendrons, which arrived from England and Holland at about the time the war broke out, have developed in the California climate into magnificent plants, and these are being stretched along the pathways of the gardens. Begonias, fuschias, hydrangeas and English laurel are being set about the miniature gardens in the Court of Abundance and in the great South Gardens.

### ART, ADAPTABILITY AND COLOR ARRANGE-MENT IN THE FLOWER GARDEN.

By Joseph Robinson, New York.

One of the most striking evidences of the advance of floriculture to the original scenic effect for which it was primarily intended by nature, is the gradual revision from the old formal and inartistic style of arrangement that held sway in the Victorian era. Up to 10 years ago there were very few large country estates but what were marred by the prevailing idea of formality and patternism, as I call it. The prevailing idea seemed to be carpet bedding and a general arrangement of lines, squares and circles on terraces, etc., intermixed with needless walls, statuary and clipped trees and shrubs, that the man with the shears has worked, sweat and sworn over, with the effect of completely marring their natural gracefulness, for the

purpose of making them conform to the monstrosity that had its birth on the drawing board.

The result of all this was a sameness wherever one went. Even though one found a diversity of geometrical design, yet the effect from a natural and artistic point of view was a failure. How many of our leading gardeners today can turn memory back to the old home on the other side and call back to mind a picture of that old thatched cottage with its walls and porch covered with the rose and the ivy, and how well we remember mother's wall-flowers, etc. Yes, long after we have forgotten the great designs and conglomeration of color in the gardens of our apprenticeship. Why do we see so few paintings by great artists, with the flower garden as a subject?

We find natural landscapes and wild scenery galore. It is because we find no true art in the garden above described. The more the idea of clumping and massing of trees, flowers and shrubs is carried out, with harmony of color being strictly observed, the more infinitely attractive the garden will be. We cannot find a better teacher than nature herself. There are more tints and colors in nature than can ever be diversified, yet they blend in perfect harmony no matter whether on mountain, in woodland, or dell, each and all go to

form a perfect setting.

Harmony of color is the first essential in floral arrangement and the simpler the idea, the greater the effect. The clumps and masses should be large enough so each may dignify itself to its size in due proportion. A definite color scheme should be decided on. The herbaceous border ought to have a certain contrasting effect (in places), but not above a certain proportion or the harmony of color generally

will be spoiled.

Where a good flower garden or border is desired, it is necessary to have a means of supply to keep filling in as needed. Coldframes and a small nursery are good to have on the place as a means of raising both annuals and perennials, as many of our alpine and herbaceous species, although classed as hardy, have a tendency to die out from the effect of a rigorous winter. A heavy manure mulch will often do as much harm as the weather. Salt hav or a mulch of very strawey material is much better than the more decomposed manure; for protection it is a difficult matter to maintain a continuous show of bloom throughout the season in the herbaceous garden. A system of raising and potting on subjects, such as the fuschia, heliotrope, lantana, celosia, early flowering chrysanthemum, etc., is a great help in filling in spaces that otherwise would look barren towards the fall and will repay any extra labor involved.

#### PRUNING ORNAMENTAL SHRUBS

It is doubtful whether any other necessary gardening operation is so little understood, or so seldom properly carried out, as the pruning of ornamental shrubs. In many places, and more particularly gardens of small dimensions, the cutting is carried out indiscriminately and to excess, with the result that the plants never attain the graceful contour and freedom of blossoming that Nature intended. On the other hand, one sometimes finds, even in good gardens where a large staff is kept, shrubberies that are overcrowded and neglected, and far from being the interesting and pleasing feature that a well planted and tended shrub border ought to be.

For the purpose of elucidation we may divide orna-

mental shrubs, roughly, into three sets, i. e., those that flower in late winter and spring, those that flower in summer and autumn, and those of an evergreen character. The first two sets are of the greatest importance, and, owing to the divergent character of the many kinds embraced, need the exercise of forethought and care.

Of shrubs that flower in late winter and spring we find good examples in the Winter Jasmine, Forsythia suspensa or Golden Bell, Spiræa aguta, S. Thunbergii and S. confusa, Winter Sweet (Chimonanthus fragrans), Prunus japonica flore pleno and the Starflowered Magnolia, M. stellata. Now, it is obvious that as these shrubs produce their blossoms so early in the year, they must be borne on wood that was made the previous autumn; hence to cut away any of this wood before the flowering, i. e., in autumn or winter, would mean a corresponding loss of flowers. For this reason the wise gardener will defer any cutting that may be necessary until after the flowers have faded, but the earlier then it is done the better; for this removal of wood is an inducement to the shrub to produce more growths of a robust character that will, in most instances, flower freely next winter or spring. Although this may be taken as a good general basis on which to work, some knowledge of the shrubs and the conditions under which they are grown will also be necessary. Some shrubs, notably Magnolia stellata, already referred to, are so slow-growing that very little pruning is ever needed, all that is required being an occasional thinning out of old wood. On the other hand, the Golden Bell (Forsythia) or Prunus triloba flore pleno will need their shoots that have flowered cut back close to the old wood if grown in beds or against a wall, but if grown in a border, where large specimens can be accommodated, only a few growths need be treated in this way. Much the same remarks apply to the Winter Jasmine when, on the one hand, it is grown in a confined space and, on the other where it has almost unlimited room. It will therefore be seen that the pruning of early flowering shrubs calls for the exercise of common sense and knowledge of the habit of the plants and the purpose for which they are grown.

When we come to Summer and Autumn Flowering Shrubs, the remarks as to the exercise of common sense may be applied with equal force. But here the method of pruning will differ considerably. section we may place such shrubs as Buddleia variabilis veitchiana, Tamarix æstivalis, such Spiræas as japonica and Douglasii, Ceanothuses, azureus and americanus, and Diervillas or Weingelas. With these shrubs the pruning is usually done in February or March, especially with the Buddleia and Spiræas, which are then cut hard back almost to the old wood. These shrubs produce their best flowers on growths that are made during the current year, and, by pruning severely, the formation of sturdy shoots is induced. Then someone may ask, "Why not prune earlier in the winter?" The reason is this: If the work were done, say, in November or December, the dormant buds that were left would, in all probability, start into growth almost at once, and, consequently, be very liable to damage by cold winds or frost. By leaving the pruning until March, the buds remain quiescent and the danger is to a very considerable extent obviated. The Tamarix mentioned may be pruned in two ways. At Kew it is grown in large lawn beds, and is cut down nearly to the ground level early each spring. On the other hand, if grown in a shrub border and a large plant is desired, less drastic treatment would be

called for, a partial shortening back only of the growths being necessary. The Diervillas or Weigelas need different treatment again. Although flowering in summer, the blossoms are mostly on the previous year's wood, and a thinning out of very old growths is all that can be permitted, unless some are shortened to keep them within bounds. The Ceanothuses named are cut back almost to the old wood each year, but this must not be taken to apply to such kinds as C. rigidus, C. thyrsiflorus and C. veitchianus, which flower much earlier in the year, and ought, therefore, to be treated as advised for Forsythia. Most of the ornamental flowering shrubs come under one or the other of the types that are named, and, with reasonable care and observation, their pruning ought not to be a matter of great difficulty.

With Evergreen Shrubs the work is of a comparatively simple character. It is usually done for the purpose of admitting light and air to the plants, when a general thinning out of the oldest and worst-looking shoots is called for; or to keep the plants within bounds. In the latter case shortening back of too venturesome growths is demanded, and let it be done with knife or secateurs, not with the garden shears, especially where large-leaved shrubs are being dealt with. Although evergreen shrubs can be pruned at almost any season, March is most generally favored, because new growth is subsequently very quickly formed, and any branches that may have been laid bare veiled with

greenery.—The Garden.

#### MAKING AN AZALEA BED.

Though azaleas are by no means plants requiring lots of care, they are particular as to soil, and it is in this respect that the best is not always done for them when planted. Everyone who has had to be among them knows what very fine roots they have, some of them almost hair-like, and this at once suggests a peculiar soil for them. A first requisite, suggests Joseph Meehan in Florists' Exchange, is that it should be of a sandy or light gravelly nature, and whether it be peat, decayed leaves or light loam to go with the gravel or sand, is not material. The thing to avoid is a heavy soil, which the azalea abhors.

In the making of a bed for azaleas the main thing to consider, aside from the soil, is proper drainage. Should the nature of the ground be loamy and fairly. drained there is really no need of a prepared bed, given the proper kind of soil. Should the soil be of a stiff nature it is better to dig it out to a depth of two feet, filling in with the lighter soil spoken of, so that drainage may be assured, not that the roots will extend downward to two feet. On hilly situations where drying out in summer is to be feared, it is well then to dig the bed deeper, as a protection against drought, the loose soil holding moisture better than that which is hard.

A good place for an azalea bed is where the shade from a large tree or a house will fall on it in the heat of the day. The plants prefer this, and the flowers last longer than when exposed to full sun.

Rhododendrons, andromedas of the evergreen character, and all like plants may be considered the same as azaleas in forming a bed. Fine, loose soil, good drainage, and partial shade is what they require.

# Work for the Month of March

By Henry Gibson.

The object of pruning fruit trees is so well understood by gardeners in general that it is needless to go into the details of it here. As to the time of pruning, different authorities hold different views. Some contend that early spring, just as the sap begins to flow, is the proper time, whilst others just as strongly contend for pruning during the fall and winter when the trees are dormant.

We are of the opinion, however, that from the average gardener's standpoint that any fine day during the winter is well spent in pruning. In the spring there is usually a pressure of other work, much of which will be done in a rushing, slip-shod manner if too much is left to be done at this time. Winter pruning is equally as satisfactory in normal seasons as is spring pruning, and has the advantage of greatly relieving the pressure of spring work. Any pruning that is not yet done should be attended to on the first opportunity.

All cuts of any size should be painted over after being allowed to dry for a few days. The paint will then stick to the surface better and the oil soak into

the wood.

While talking of the fruit trees it would be well to mention the spraying. Don't overlook this; it is one of the most profitable operations that can be performed. Whether you have only ten or a thousand trees, spray them.

#### HOT BEDS AND COLD FRAMES.

A hotbed or two where small stock can be raised is a most valuable acquisition to any gardener, be he amateur or professional. A layer of well-firmed manure about 18 inches deep, , and extending a foot or more beyond the area covered by the frame, will generate sufficient heat to resist any belated cold spell that is likely to overtake us during March, and will last until the warm days of spring are with us again. The later the hotbeds are prepared the less fermenting material will be required, and if some hay, straw or leaves be mixed with the manure it will last longer, and the heat will not be so intense. Three or four inches of soil is enough for the raising of seedlings or rooting cuttings. This layer of earth should not be put on until the first rank heat has escaped, and no seeds or cutting should be put in the soil until the heat has settled down to, and gives indications of remaining steadily, at from 60 to 65 degrees. Should severe weather set in after the bed is made up, the sash should be put on, and a covering of hay, straw, or mats over them all round the frames will do much to maintain the heat at an agreeable point.

There are few kinds of seeds, cuttings, bulbs, or small potted plants that cannot be successfully handled in a hotbed, and for the man without a green-

house such is invaluable.

Pansies, myosotis, daisies, etc., that have been wintered in cold frames should be aired more freely than has hithertofore been possible. These plants will hardly suffer to any great extent from severe cold or sudden changes in the temperature, but if allowed to remain covered during a real warm spell they are bound to suffer. Go over them carefully and pull out any weeds that may have grown up, and water any of the plants that show signs of dryness.

#### FANCY LEAVED CALADIUMS.

There are few plants that can be used to better advantage in brightening up and adding color to the

conservatory during the summer months than the fancy leaved caladiums. Those who have need of this sort of thing would do well to get some started during the present month. They don't make much head-way until well along in June, but those started early make extra sized plants and are well worth the trouble. A good way to start them is to put them into 2½-inch pots in a light sandy soil. Care should be taken, however, to have a layer of clean sand immediately below the bulbs. The pots should then be plunged into peat litter in a propagating case, where a bottom heat of from 75 to 80 degrees can be maintained. Another way to start these caladiums is to plant them close together in flats on a layer of moss and cover overhead with the same material. The flats are then elevated on bricks over the hot-water pipes. When potted they should have a compost of fibrous loam, leaf mold, and sand, with the addition of a little broken charcoal. Give them a night temperature of 40 to 45 degrees and keep the atmosphere rather humid.

#### Cannas.

Cannas that have been stored away in the cellar should be started into growth. Clean away the dead leaf bases and cut the roots into pieces, each having two eyes. If one is short of stock and a large quantity is required, cutting to one eye may be practiced, though we do not think that the plants are so strong when only one eye is left. Set the pieces close together in flats containing a mixture three parts good loam, two parts leaf mold and one of sand. To start well cannas require a brisk bottom heat, and this can easily be provided by placing the flats on the heating pipes in the rose house. Of course, if one has sufficient room in the propagating bench they will start equally well there. Watering should be done with care until growth is active, but on no account should they be allowed to dry out whilst starting into growth.

Callas.

It is from late winter down through the spring months that callas yield the greatest supply of flowers. They like copious supplies of water at the roots and frequent syringing is necessary to keep down red spider. Callas are strong growers and the constant production of foliage and flowers render feeding necessary at frequent intervals. Liquid cow manure, applied twice a week, and an occasional dose of soot water will go a long way in keeping the plants in first-class condition.

STEVIA.

Place the stock plants of stevia close up to the glass, so that they will produce sturdy cuttings. In a carnation house, they will soon show plenty of cuttings, which can be placed in the sand alongside the carnation cuttings, and they will coat without any trouble.

Pricking of Spedlings.

There will be lots of seedlings that will be ready to prick off into flats or be potted up. As the days lengthen and the sun gains more power it will be necessary to watch the seedlings more closely and see that they do not dry out. Use a good proportion of leaf mold for all seedlings, and if some old manure from a spent hotbed can be incorporated with it the seedlings will be all the better for it. Careful watering, shading from bright sun for the first few days, and a moderately close atmosphere will do much towards reducing losses to a minimum.

#### NEW YORK'S SPRING FLOWER SHOW.

Of the planning and preparation necessary to produce a flower show of the scope of the one which will be held in New York in March 17-23, the average person has but a slight conception; for few will realize, as they visit the show in the Grand Central Palace next month, that

F. R. PIERSON, Chairman New York Flower Show Committee,

what they see before them is the result of the untiring efforts of a small body of men, who, for more than a vear, have devoted much of their time and thought to bring together the vast collection of beautiful plants and flowers which will be gathered in the large auditorium when the doors are opened to the publie on March 17.

The endless detail which enters into such an undertaking -t he making up of the schedule to meet all requirements—

providing the premiums—securing the exhibits—and finally procuring the attendance—is a task which makes big demands on the time of the members of the committee all of whom render their services gratuitously. It necessitates the holding of an executive meeting every week and regularly on Saturday afternoons the committee, which is composed of F. R. Pierson, F. R. Newbold, T. A. Havemeyer, George V. Nash, Prof. N. L. Britton, James

Stuart, Jos. A. Manda, and M. C. Ebel, representing the Horticultural Society of New York and Harry A. Bunyard, Wm. H. Duckham, C. H. Totty, Frank H. Traendly, Julius Roehrs, W. H. Siebrecht, Sr., W. R. Pierson, F. L. At-kins and John Young, representing the New York Florist Club, meets at the Grand Central Palace where the various details entering into flower show promotion are worked out. The prizes, \$15,000, which will be offer-

ed at the New York Flower Show, exceed in value those offered at any other show held in the Grand Central Palace and in this building the automobile and all big shows are held. A flower show at the Grand Central Palace must be managed on the principles of the regular show business, for, in order to draw the public to it—

and secure the necessary publicity for such a show, attractions must be presented which do not fall far short of sensational; and, to accomplish this, the committee has planned some surprises for the coming show, in the nature of exhibits and arrangements which have never before been attempted at a flower show.

That the non-commercial, or private grower, is looked upon as an important factor in the 1915 New York Spring Flower Show is quite evident from the following communications which have come to us from F. R. Pierson,

RICH G. HOLLOMAN, President International Exposition Company.

chairman of the Flower Show Committee, and from Arthur Herrington, General Manager of the Show.

It remains with the gardener to come to the fore and do his best, for the success of the show will reflect great credit on his profession and will materially aid in arousing a greater interest in horticulture.

John Young, secretary of the Flower Show Committee will be glad to furnish schedules, or any other information re-

garding the show, to all those who may be interested and will apply to him, in person or by letter, at his office, 53 West 28th street, New York.

One of the most enthusiastic workers of the Flower Show Committee is Richard G. Holloman, president of the International Exposition Co., which company con-

trols the Grand Central l'alace. Mr. Holloman represents his company on the Flower Show Committee and his association with the flower shows of 1913 and 1914 have made him an enthusiastic horticulturist. It is worthy of note that of all the portraits published on this page Mr. Holloman alone bears the emblem of floriculture—the boutonniere. Holloman's slogan is, "It pays to advertise, and he constantly urges his

men that it is as essential for those engaged in the pursuits of horticulture to advertise themselves as it is for those engaged in any other vocation.

Two of the hardest workers on the Flower Show Committee are men not affiliated with the horticultural trade—

although both are much interested in horticulture—T. A. Havemeyer, vice-chairman, and F. R. Newbold, treasurer of the committee. The great success of the 1914 show was in a large measure due to the work of Messrs. Havemeyer and Newbold as members of the 1914 Flower Show Committee, and they are found working just as earnestly this year to make the 1915 New York Spring Show the greatest flower show ever produced in this country—and everything indicates that they will succeed.

#### AN INVITATION TO THE GARDENERS.

Ornamental horticulture will be the feature of the International Flower Show, to be held at the Grand Central Palace, March 17-23rd, and the opportunity presents itself to the private grower to show his skill in arrangement and effect, for the schedule offers many classes where arrangement will count materially in the judging.

The Flower Show Committee is endeavoring to produce a flower show this spring entirely unlike anything heretofore produced, and if it can count on the support of the private gardeners it will be possible for it to accomplish what it has set out to do.

The schedule has been prepared so as to enable all gardeners to compete at the show; for there are classes for those who are in position to make big displays and classes for those whose means for exhibiting are limited.

My gardener friends, we invite to you to put your best efforts forward—to enter in as many classes as your facilities will permit you to do—and in this way co-operate with us to make the 1915 New York Spring Flower Show the most successful ever held.

F. R. PIERSON, Chairman, International Flower Show Committee.

#### AN APPEAL TO THE GARDENERS.
